MINING AND SCIENTIFIC PRESS.

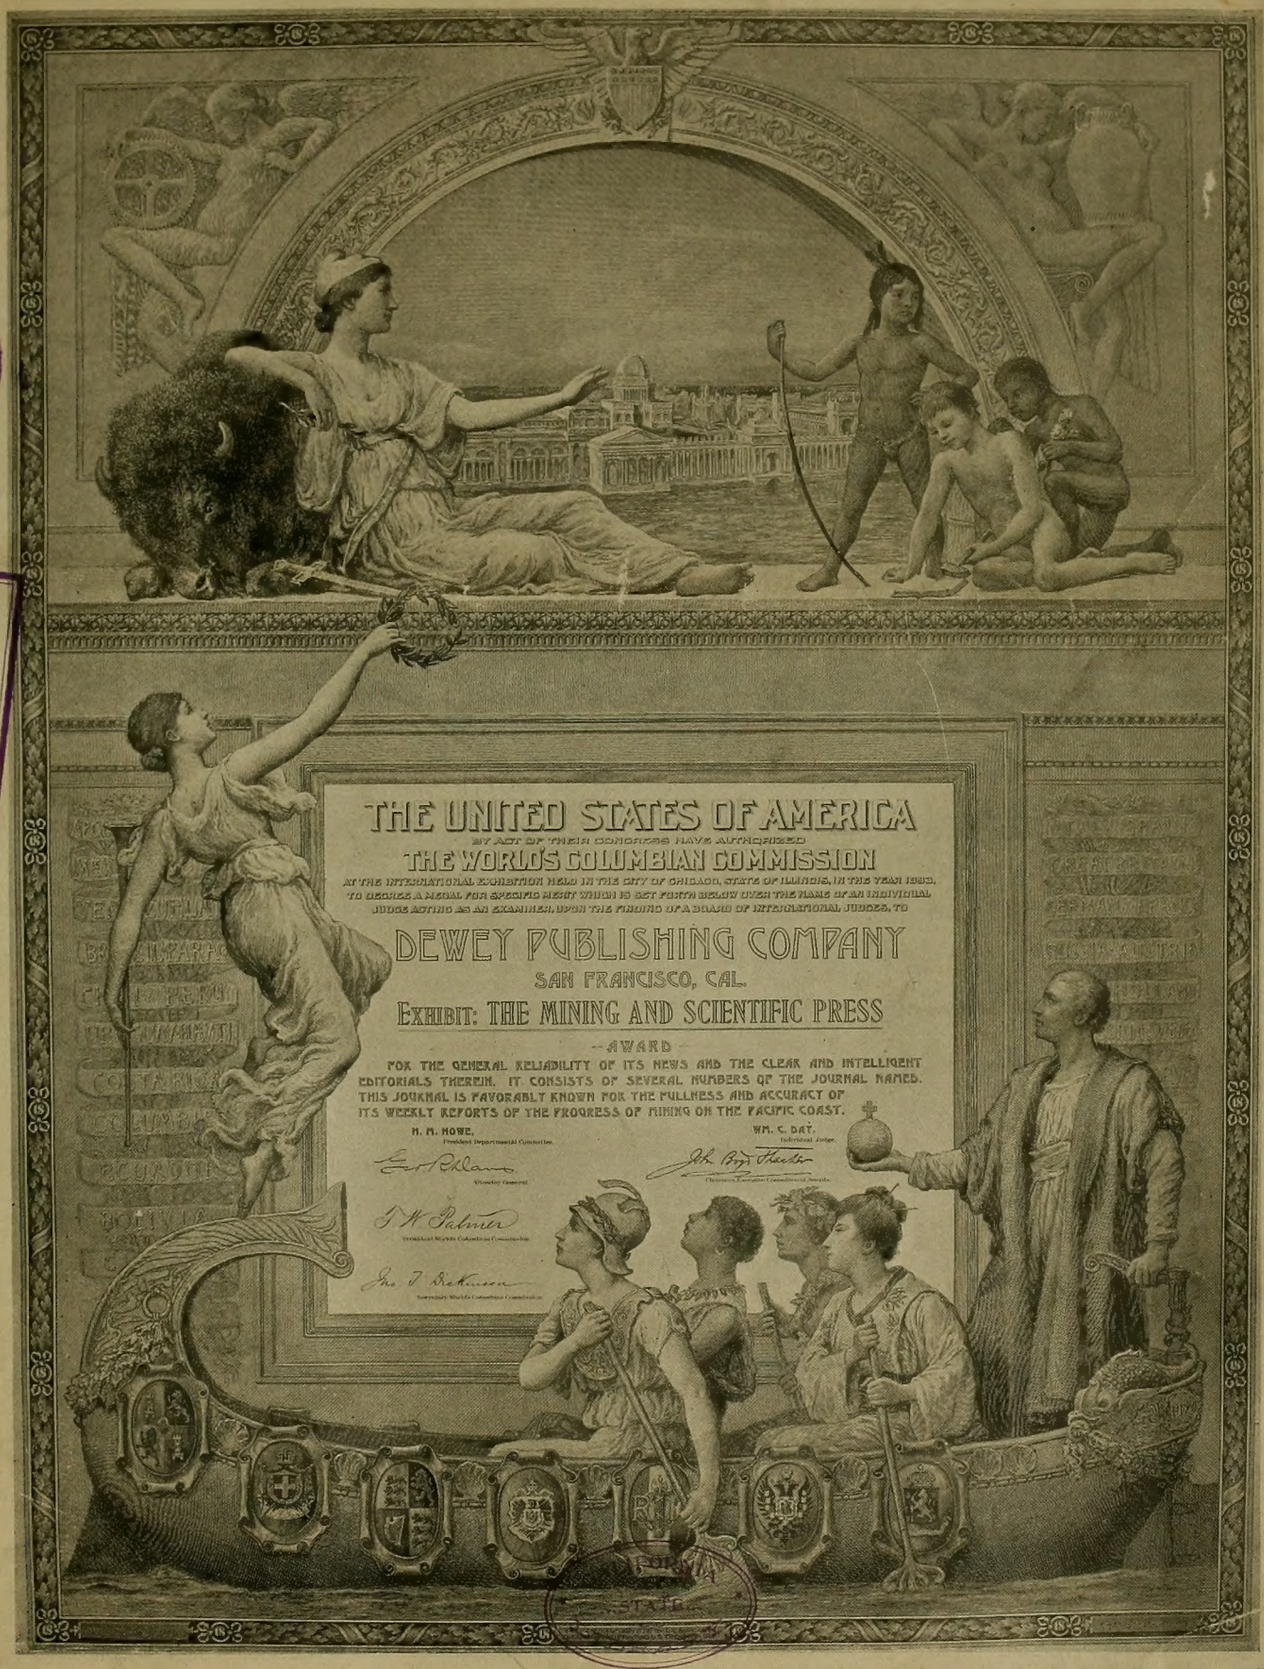
AND PACIFIC ELECTRICAL REVIEW.

No. 1078.—VOLUME LXXIII. Number 1. SAN FRANCISCO, SATURDAY, JULY 4, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Cal State Library

CALIFORNIA STATE LY.

This Paper not to be taken from the Library.



THE UNITED STATES OF AMERICA
BY ACT OF THEIR CONGRESS HAVE AUTHORIZED
THE WORLD'S COLUMBIAN COMMISSION
AT THE INTERNATIONAL EXHIBITION HELD IN THE CITY OF CHICAGO, STATE OF ILLINOIS, IN THE YEAR 1893,
TO DECREE A MEDAL FOR SPECIFIC MERIT WHICH IS SET FORTH BELOW OVER THE NAME OF AN INDIVIDUAL
JUDGE ACTING AS AN EXAMINER, UPON THE FINDING OF A BOARD OF INTERNATIONAL JUDGES, TO
DEWEY PUBLISHING COMPANY
SAN FRANCISCO, CAL.
EXHIBIT: THE MINING AND SCIENTIFIC PRESS
AWARD
FOR THE GENERAL RELIABILITY OF ITS NEWS AND THE CLEAR AND INTELLIGENT
EDITORIALS THEREIN. IT CONSISTS OF SEVERAL NUMBERS OF THE JOURNAL NAMED.
THIS JOURNAL IS FAVORABLY KNOWN FOR THE FULLNESS AND ACCURACY OF
ITS WEEKLY REPORTS OF THE PROGRESS OF MINING ON THE PACIFIC COAST.
H. H. HOWE, President Departmental Committee.
WM. C. DAY, Individual Judge.
J. W. Palmer
Jno. T. Dickinson

THE COLUMBIAN COMMISSION AWARD TO THIS PAPER.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 220 Market Street, Northeast Corner Front, San Francisco
☞ *Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

Our latest forms go to press on Thursday evening.

J. F. HALLORAN.....General Manager

San Francisco, July 4, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Columbian Commission Award to This Paper, 1. The Pole Line at Fresno; Pipe Line Descending the Hill to the Power House; Reservoir; Power House, Showing End of Pipe Line and Receiver over Pelton Wheels; Interior of Generator Room; Switchboard in the Power House, 5. Picture of a Tornado, 6.

EDITORIAL.—The Question of "Sound Money;" Test of Compressed Air on Street-Car Motors; The Mountain Mines Co., Ltd.; Silver and Miners' Wages; Assessment Work, 2.

ELECTRICAL PROGRESS.—The 35-Mile Electrical Power Transmission at Fresno, Cal., 5. Electric Furnace; Electric Process of Converting Emery into Corundum, 6.

SCIENTIFIC PROGRESS.—Relative Abundance of the Elements; Soda-water Cartridges; Picture of a Tornado; Photography in Colors; Existence of the Three Conditions of Matter; American Society Civil Engineers; A Girl Sees the Roentgen Rays; The Cathode Rays; Reduces the Stiffness of a Board, 6.

MECHANICAL PROGRESS.—Iron Ore Mining at Lake Superior; Sources of Energy After Coal; Sheets of Glass Useful; Figures Relating to Electrical Development; Compressed Air as a Street-Car Motor, 7.

PRACTICAL INFORMATION.—Forests and Stream Flow; Uses of Olive Oil; A Rapid Rate, 7.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 10-11.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 22.

MISCELLANEOUS.—Concentrates, 3. Separation of Silver from Gold by Volatilization; Reduction of Ores in Mexico; Plain Talk on Ore Testing, 4. Index to Volume LXXII, 8-9. California Mines and Miners, 9. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent California Mining Incorporations; Recently Declared Mining Dividends, 14.

Assessment Work.

Ordinarily a multitude of questions are weekly answered in a condensed form in "Concentrates," on page three of each issue, the question itself being omitted for want of space, the answer, in a concise form, often answering several similar inquiries. So many queries have, however, been recently received regarding assessment work, that, at the risk of repetition, the law on the matter is herewith reproduced. While to a majority of our readers such reproduction is manifestly unnecessary, it is to be borne in mind that a great number of new hands at the business have joined the ranks of the miners and prospectors in the past two or three years.

The U. S. mining law applicable to this subject says:

SECTION 2324. The miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground, so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the locations, and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until a patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year: *Provided*, That the period within which the work required to be done annually on all unpatented claims, so located, shall commence on the first day of January succeeding the date of location of such claim. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made by the first day of January, eighteen hundred and seventy-five, and each year thereafter, for each one hundred feet in length along the vein, until a patent has been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim; and where a person or company has or may run a tunnel for the purpose of developing a lode or lodes, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, whether located prior to or since the tenth day of May, eighteen hundred and seventy-two, and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same as required by said act. Upon a failure to comply with the foregoing conditions of annual expenditure, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns, or legal representatives, have not resumed work upon the claim after failure and before such location. Upon the failure of any one of the co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing or by publication such delinquent should fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners, who have made the required expenditures.

The above includes the amendments of Feb. 11, 1875, and Jan. 22, 1880.

It has been decided that labor performed or money expended on any unpatented mining claim prior to the 1st day of January succeeding its date of location cannot be made a part of or be applied to the first annual expenditure legally required. That is: Upon a claim located any time in 1896 the period within which the required $100 labor or improvement must be performed begins January 1st, 1897, and during the calendar year 1897 such amount of expenditure must be made or the claim will be subject to forfeiture and relocation on Jan. 1st, 1898. No amount of prior expenditure will count.

It is to be noticed that the law in this case is very liberal. Any one who is or who has declared intention to become a citizen can locate and work vacant mineral ground. In the interest of bona fide miners and prospectors the time required to do even enough to hold the claim against any one is stretched to the utmost limit of liberality. One who took up a claim last January or February, or any time this year, has all the year of '96 and all of '97 to do the required amount of work or expenditure. Where two or more jointly own a claim, any one of the co-owners who does his proportional share of the required work can hold his interest.

While the law is thus easy, it is a matter of regret that effort is frequently made to evade it. No miner or prospector can afford to attempt evasion of so liberal a statute.

There is no limit to the number of claims any individual or corporation may take up. But there is obviously a limit to the number that can be worked, and here, too, a dog-in-the-manger policy is too often put in practice, and a man or set of men will try to hold a dozen claims and cover the whole country, when it is impossible for them to do the legal work necessary to hold one. A man should either work the ground claimed or forfeit it; if he can't hold it, let him give it up. It is too common a practice to attempt holding what cannot be utilized, and public sentiment the world over is against the man who "bites off more than he can chew." It may sound hard, but a little reflection will show the would-be monopolist that he is doing himself as great an injustice in his grasping effort as anyone else, and that private gain, as well as public policy, is against the effort to hold more ground than can be developed, at least to the meager extent contemplated in compliance with the letter, but not the spirit, of the law.

Silver and Miners' Wages.

Some papers express surprise that this paper should advocate the remonetization of silver, inasmuch as "this is a gold producing State." That is, like our Atlantic coast brethren, they mix up the issue and fail to see that it is not an industrial question, but a financial one. As the exponent of the miners of this coast, this journal advocates that which is for the best interests of all. Whatever they produce, whether gold, silver, copper or lead, the metal miners have common interest in the matter, for what affects one affects all. Looked at even purely as an industrial proposition; putting it on the narrow, local level suggested by so many papers; taking the simple question of wages paid to working miners, it is evident that the demonetization of silver has hurt the gold miner. Where is the miner to-day who is paid $4 per day, seven days in the week? Up to the time when silver was demonetized wages cut no figure in gold or silver mines. Four dollars a day was the ruling rate, straight through. When the ground was cut away and silver was made a mere commodity, down came the wages of the miner. The fall affected not only the silver miner's daily pay, but it carried down the wages of the man who worked in a gold mine, too. Then, when silver mining was no longer possible and men were discharged by thousands, and the mines shut down, they were obliged to come into competition w[illegible] their former coadjutors. Their experience as silver miners was no longer available, but they could polish the head of a drill, could timber or do other mine work, and many from present necessity sought work in the gold camps. The old story, "two men for one job," had the inevitable result.

This is a phase of the fight not often touched on, but it is a serious matter, and a feature of the unjust fight against silver. It is one of the reasons why this paper advocates silver. Some time ago the writer visiting Nevada City and Grass Valley, two of the most prominent and prosperous gold mining towns on the coast, met many who in the old days of silver activity were able to get good wages and steady work as miners, millmen, etc. They all had the same story: "Everything is shut down where I used to work and I've come here to try to find something to do."

This is something that requires no elaboration. It comes home to every man who ever worked in a mine, and is something that no man who never worked in or around a mine can understand. But the miners understand it, and they know well that beside the poverty of once prosperous mining camps the blight that has fallen on the silver mining industry has indirectly hurt them by bringing their former allies into competition with them in the merciless struggle for existence.

The argument this journal has all along made for silver is on the proposition that the question is a great financial one, and should be lifted out of the narrow local rut of a mere industrial question. But even on that ground it can be shown that every dictate of industrial policy, every sentiment of equal justice, and every suggestion of self-preservation for the working miner favors the rehabilitation of the industry that would restore prosperity to those men. Underlying the weal of all lies this question of employment, and while this paper has never put forward the plea that silver should be remonetized merely to afford employment to miners, yet a little thought will show to a fair thinking man in or out of a newspaper office that even on the ground of silver being an industrial question it is a matter of business. The real reason for favoring the remonetization of silver is because of its great national importance as a financial question affecting all alike whether residents of Maine, Montana or Texas, but even on their own chosen field of argument those who claim that it is only a local industrial question must concede that it is one that directly affects the fortunes of the gold and silver miner alike.

JUST ten years ago San Francisco men bought the "Lost Confidence" mine in Shasta Co. for $125,000, paying $50,000 cash, the rest payable from the mine's net earnings. They built a 20-stamp mill, and, altogether, spent $100,000, when they found that the ore was not free milling. As it carried too little lead for smelting by the processes of that day, and too much base other metal for treatment without wasting, the whole thing was abandoned. Eight years afterward an English company bought the same property for $300,000, and under the name of the Mountain Mines Co., Ltd., have spent as much more in improvements, including a smelter of latest construction and a railway. Preliminary work has not been wholly satisfactory, and the natural reluctance of the managing directors to give information has given rise to a multitude of unauthorized statements. All work is at present suspended, but it is believed that, with the advent of the new roasting plant to be constructed, and some minor changes in the original plans, that success will be attained, and that the property will become a paying one Such projects as the present one require considerable time, outlay and patient experiment.

MECHANICAL and scientific progress are busier than ever with motor experiments. The present week sees a practical test of compressed air on the Chicago General Railway Co.'s lines, and an even more ambitious effort on the part of the New York Central Railway Company, which is experimenting with a still newer style of motor—hot water in supply boilers under high pressure. The technical explanation received suggests the thought that; as between steam and "hot water under high pressure," the latest projector appears to be traveling in a circle.

ACKNOWLEDGMENT is made of the receipt, chiefly from Atlantic sources, of a vast and varied amount of printed and written information and misinformation on the question of "sound money," intended to convince this paper of what one well-intentioned adviser styles its "heresy." Will some one, in this regard, kindly define the meaning of the words "heresy" or "heretic"?

Concentrates.

A "DRIFT" follows the vein: a "crosscut intersects it.

OCTOBER 7th will be "Miners' Day" at the Spokane, Wash., fair.

CYANIDE OF POTASSIUM in ton lots is worth 40 cents per pound here.

"THE richest gold field in the world" is in Georgia, this week.

THE Merced Gold Mining Co.'s $2 assessment is payable on the 12th inst.

THE little list of going silver mines on this coast gives present promise of increase.

LOCAL papers announce the introduction of Japanese labor into the mines of Butte Co.

THE average number of natives employed in the Rand district, South Africa, in 1895 was 55,000.

BRITISH COLUMBIA has many excellent local mining papers, full of fresh and reliable mining items.

THE biggest mill in Los Angeles Co. is believed to be that of the Lone Jack mine—a 60-stamp affair.

GOLD, copper and petroleum are the three mineral products of this State in most present active demand.

KASLO AND NELSON, B. C., protest strongly against "the importation of cheap labor from Ontario and Quebec."

DESPITE unfavorable reports, the Harqua Hala, Arizona, mine is able to show an average monthly net profit of $2500.

THE Champion's 75 stamps are about ready to start, giving it a greater number than any other mine in Nevada Co., Cal.

THE U. S. Debris Commission have several applications for permits to act upon this month. They meet on the 20th inst.

"WITHOUT cyanide," says the London *Mining World*, "the Randt would be almost nothing but a geographical expression."

THE price of lumber at Circle City, Alaska, has come down, and dressed lumber for sluices, etc., can now be had for $120 per M feet.

THE State Mining Bureau is having prepared a list by counties of all the quartz mills in the State, number of stamps, etc.

RETURNS so far as received indicate that the gold yield of the State for the first half of '96 exceeds that of the corresponding part of '95.

THIS is the 1878th issue of this journal, the first number of Vol. 73. With this issue the MINING AND SCIENTIFIC PRESS enters upon its 37th year.

DEFERRING the sale of any mining stock till the title to the claim is perfected, besides being honest, is almost invariably the only mutually satisfactory method.

A PATENT was filed for record in the Siskiyou County Clerk's office of this county last week, granting 87,221.09 acres of land to the Central Pacific Railroad Company.

IN 1893 the gold output of Yavapai county, Arizona, was $339,740; in 1894, $867,840; 1895, $1,258,851. In 1895 the silver output was 256,931 ounces; in 1895, 322,033 ounces.

DISCOVERIES of petroleum at Kisbueena Creek, East Kootenay, B. C., are said to be of sufficient importance to justify the belief that coal oil will be a production of that province.

ONE by two California miners are returning from other fields, where, in most instances, they have achieved substantial success, but realize that there is only one California.

THE Rosemont, Arizona, copper mine has been bought by Lewissohn Bros., N. Y., owners of the Old Dominion mine at Globe, now shut down because of disagreement with the men as to wages.

THE Clear Creek Mining Company is locally credited with having made all the necessary arrangements for the erection of a 20-ton smelter on Clear Creek, nine miles from Redding, Shasta Co., Cal.

THERE is a rising market now for every metal mined. Silver is higher than it has been since December, '93. On March 5th, '94, it was 58¾; now it is 70. Lead and copper also show an appreciation in price.

THE big strike at Leadville, Col., still exists. About 1,200 miners are idle. The mine pumps will not be drawn, thus obviating the expense of unwatering when work is resumed, as of course it ultimately will.

FOR "steady work," probably the Mayflower drift mine, Placer Co., has a record not surpassed by any mine in the State. It has been operated, without the stoppage of a single day's work, for over seven years.

ON page one of this issue is a reduced engraving of the World's Columbian Exposition award to this paper, made in the fall of '93 and but recently received. The original is 26x37 inches and is handsomely framed.

A. J. TRUMBO says the Gover mine, at Amador City, is compelled to pay $16 a ton for the chlorination of its ores and that after the cost of extraction is deducted, the margin is very small. He is again contemplating the cyanide process.

IN the *American Geologist* for June, '96, appears an excellent article on Syenitic Rocks from California, written by H. W. Turner. The rarity of that class of igneous rocks in the Sierra Nevadas lends unusual importance to the article.

THE executive board of the Western Federation of Miners, regarding the strike ordered at Louisville and Leadville, Colorado, and Custer mining district, Idaho, requests miners to "remain away from those places till the strike is settled."

IT is stated that the cost of copper production by the Boston & Montana Co., Butte, Montana, which last year was 5.72 cents per pound, is now less than 5 cents per pound. A Michigan local paper says it costs the Calumet & Hecla 6½ cents per pound.

THERE are twenty-one applications for permits to operate hydraulic mines before the U. S. Debris Commission this week. For several months the commission has been financially unable to do anything, but is now in funds, the $15,000 appropriation being immediately available.

AS in other localities, Portland, Or., business men are embarking in the business of gold mining. Time was when no Oregonian west of Baker City or north of Grant's Pass would talk mines, but hard times make men willing to get the condensed representative of all wealth out of the ground.

SINCE the passage of the River and Harbor bill, appropriating $250,000 for constructing restraining barriers on the tributaries of the Sacramento, there need be no question about the payment of the State Debris Commissioner. It was on the contingency of such appropriation that the controversy hinged.

THE gas trouble in the Con. Virginia mine on the Comstock lode is said to come from the old bonanza workings. From an official source it is learned that this bonanza was 700 feet long, 200 feet wide and 600 feet deep. After the ore was extracted the space was filled in as best it could, but the moving of the Comstock ground causes more or less friction, which ignites the wood in the excavation and causes smoldering fires and poisonous gases.

THE Secretary of the Interior has approved supplementary list 33 A, selected by the Central Pacific Railroad, successor to the California and Oregon line, consisting of 800.68 acres in the Redding district. He has also approved clear list 38, affecting land in the Visalia district.

THE London *Westminster Gazette* says: "The consumption of copper for the twelve months ending June has been 51,000 tons larger than in the preceding year. Since the end of April last there has been a rise in the price of Chili bars to the extent of £2, which is hardly matter for surprise."

CALIFORNIA papers publishing advertisements of transportation companies, setting forth the advantages of immediate departure to the West Australian gold fields, might mitigate the misleading announcements by reproduction of some of our correspondent's letter from there, which appears on page 11.

UNDER the new management the Hale & Norcross mine on the Comstock lode has made several reductions in expenses. Outside of those heretofore reported they have reduced the price of lumber from $19 to $16 per M; wood from $7.50 to $6.50 a cord, and powder from 20 cents a pound to 13½ cents a pound.

THE Secretary of the Washington State Mining Bureau writes that that organization "is a public enterprise for the public good, the objects being the collection and dissemination of reliable information regarding the mines and mineral resources of the Northwest and Alaska," which is a laudable purpose.

NOT even gold mines exceed in dividend-producing capacity some of the country's big copper mines. On May 1st the Anaconda, Montana, Co. paid a $750,000 dividend. On the 13th inst. the Calumet and Hecla, Michigan, will pay a $500,000 dividend, making an aggregate to that date of $45,850,000 profit to its stockholders.

THE $250,000 National appropriation in the river and harbor bill and the $250,000 contingent State appropriation became available last Wednesday for the construction of restraining barriers in the Sacramento, Feather and Yuba rivers, and the board of Government engineers in this city now have the preliminaries of the work under consideration.

SUPERINTENDENT CRONAN of the Hale & Norcross mine, made 48 feet a week in the south drift on the Brunswick lode. This is considered quick work by miners although Cronan does not seem to think it anything worthy of special mention. He had three shifts of men. The drift is of the usual size for running cars and other mining purposes.

BECAUSE of improved transportation, more people and cheaper prices of all supplies, $100 will do as much in the way of mining to-day as $350 would twenty-five years ago. The gold product, however, brings just as much to-day as it did then. This is the only business on earth to-day of which the same thing can with truth be said.

A "STEAM PUMP" is a pump in which the long rods connecting the ram with the piston are dispensed with. The steam cylinder and the water ram being both included in one self-contained machine, and the steam conveyed from the surface to supply the power, the displacement is produced either by a ram or a piston, single or double-acting.

FOLLOWING is the production of the Robinson, South Africa, mine for May: Mill, 120 stamps; 15,589 tons crushed; yield of smelted gold, 12,490 ozs.; from concentrates (by chlorination), 730 ozs.; from tailings (cyanide process), 2245 ozs.; from slimes, 1585 ozs.; from own ore, 17,050 ozs.; from concentrates bought (by chlorination), 2283 ozs.; total, 19,333 ozs.

DURING June bullion was produced for account of the Con. Cal. & Virginia M. Co. at the Morgan mill from 958 tons to the amount of $34,758.19—$17,377.91 gold, $17,378.28 silver. The yield in bullion per ton averaged $36.27. The average assay of the ore per battery samples was $52.36 per ton. The assay value of the ore per ton, per railroad car sample, was $55.95 per ton.

PRACTICALLY all of the field work of the United States Geological Survey is now under way. About forty or fifty geological and almost as many topographical parties have resumed operations throughout the country and will continue until the close of the season in September and October. These parties number from one to three experts each in addition to the laboring assistants.

WHILE the report of a competent mine expert is always entitled to respectful consideration and justly carries great weight, yet it is not always correct or conclusive. Many a good mine has been condemned erroneously. The announcement of the Morning Star drift mine's 60th dividend—$6 per share—recalls the fact that that property was reported upon adversely by two reputable mining engineers.

THE Mount Morgan, Australia, gold mine, a pulverized mass of finely comminuted particles, yielded, in 1895, 128,699 ozs., valued at $2,643,500. That year it paid in dividends $1,500,000. This mine was opened in 1886, and has since yielded 1,331,015 ozs., over 55 tons, of unusually fine gold of a value of $27,233,645, from which $20,375,000 have been paid in dividends. Last May there were 8767 tons concentrates chlorinated, yielding 10,876 ounces gold.

THE old, old "apex question" last week started a $750,000 law suit between the Marion and Geyser Mining Companies, Mercur, Utah. Sometime, before Life's lessons have all been learned, and suns and stars forevermore have set, this matter of "apex" and "extralateral rights" will be straightened out in the only possible way that can give general satisfaction—by a complete revision of the present U. S. mining laws in that respect.

A BANGOR correspondent writes that never in the history of Butte Co. were there so many prospectors at work as at present. He adds that a large number of them are not practical miners, but are out looking for prospects just the same. The same is true in a modified way of nearly every gold producing county in the State. Dull times throughout the State have turned the attention of thousands to the fact that after all the millions in the mountains are now the readiest sources of wealth.

THE Selby Smelting and Lead Co. say that the reports regarding fabulous profits to be made out of the purchase of the Caillot Chlorination Works at Grass Valley are wholly without foundation. The only truth in the report is the price paid for the property, which was $5000, as stated herein. The story that they had made $95,000 was circulated without authority. The purchase was made for the purpose of securing a pile of chlorination tailings for reduction at their works at Vallejo Junction, upon which they only expect at the best a small margin of profit.

A GOOD many remote regions have set up claims to being "the greatest gold producing area," with implied assumption of California's claim thereto, but so far no part of the globe has trenched upon California's other attractions. Now, however, New Zealand is trumpeted as having in addition to some gold, "the finest climate on the earth." This is too much. If there is any one thing that California justly claims superiority in it is its climate, not only in its beauty, but variety. The Land of the Maoris may claim anything else without a remonstrance, but we make a firm stand on climate and will not admit that any other region can justly claim to be the place where simply to feel that we breathe, that we live is worth all the joys that life elsewhere can give.

BRITISH COLUMBIA has its Uitlanders, says the Trail Creek *News*, a considerable and increasing body of gold hunters, who for the last two years have been thronging into the heart of the Kootenay district from the United States. The provincial government has not made the mistake committed by the Volksraad of the Transvaal, however—this is, it has not loaded the newcomers with taxes. It has enacted a new mining law, not unlike that in force in Ontario, and, though received with some murmurs of dissatisfaction by the mining interests, it seems to be easy enough on those interests.

SEVERAL communications have been received relative to the new Rigaud process recently noted herein. The process is being given a practical test on a large scale by the Tancarville Co. near Havre, France, the result being as yet unknown. The claim that the total cost of mining and treating the ore will not exceed $1.80 per ton is not an extraordinary statement. Better results have been attained in California, Alaska and South Dakota. In the latter State, at the Deadwood-Terra mine, a 160-stamp mill crushes 15,000 tons per month of ore that averages $1.80 per ton. The cost of mining and milling it is $1.40 per ton, leaving a monthly profit of $6000.

A SKAGIT, Wash., man sends some asbestos and "talc," asking what he can do with it. If sufficient quantity can be had of the asbestos of the length and fineness of fiber in the sample, it will bring $30 per ton here. The soapstone he sends is of doubtful value, commercially. Talc is used for many things—in the manufacture of paper, "French chalk," household utensils, furnace lining, mineral paint, lubricants, etc. Fine talc, well ground and of uniform character, is worth from $12 to $18 per ton. It should be milled where mined, but the machinery is unique and expensive, and the quality and quantity of the body should be fully determined before any outlay.

JOHN M. DOUGLAS & Co., London, write: "Mining goes on more actively than ever. One hears of the agents of the greatest houses of the world searching America, Africa, Australia, and of late New Zealand, for new good mines, buying only the choicest, not to 'float' for companies, but to work for their own profit—gold, silver and copper, or whatever pays. Strife in South Africa has somewhat hindered progress, but real work, and much preparation for more, goes on all the time. Indian mines are doing well. New Zealand has found some very fine new gold mines. The latter are likely to be largely dealt in here if reports of them be confirmed. West Australia has been laid hold of by the greatest crowd of promoting companies ever seen."

THE mineral products of the United States for the calendar year 1895 are reviewed at length in the mineral resources report of the United States Geological Survey. The report, which was compiled by Dr. David T. Day, chief of division, shows the total value of the product as $611,795,290, against a production valued at $527,368,594 for 1894, an increase of over $84,000,000. The quantity and value of some of the various products for the year were as follows: Pig iron, 9,446,308 tons, $105,398,550; silver, $47,000,000 ounces, $60,766,300; gold, 2,273,629 ounces, $47,000,000; copper, 381,106,868 pounds, $38,682,346; lead, 161,440 tons, $10,665,040; quicksilver, 36,104 flasks, $1,337,131.

DAN DE QUILLE is writing an article for this paper entitled, "The Golden Backbone of the World." This "golden backbone" is the great chain of mountains extending from Terra del Fuego, on the Antarctic ocean, to the Arctic ocean, known as the Andes in South America, as the Sierra Madre in Mexico and as the Rocky mountains in the United States and British Columbia. It is the longest continuous mountain chain on the globe and the most uniform. It is over 9,000 miles in length. It gives birth to the Mississippi, the Amazon and thousands of other great rivers and lakes. On its heights, in Peru and Mexico, was seen the first dawn of the light of civilization among the aborigines of the continent. It has been and still is the world's great storehouse of treasure—gold, silver, precious stones of all kinds and all the useful metals. It saved the civilization of the world and is still saving it. It brought the human race out of the poverty, ignorance and slavery of the Dark Ages and gave them a new start—"a big boom."

THE Government pays for gold at the rate of $20.67 per ounce fine, or $18.60 per ounce standard (.9 fine). There is no charge for coining gold. When the bullion deposited is not suitable for coinage, and requires parting and refining, charges are made for these operations equal to the expense incurred in eliminating the base metals and parting the gold from the silver when the two metals are combined. There is also a charge of 2 cents per ounce for copper required for alloy. Upon gold bullion of standard fineness—that is, containing .9 gold and .1 copper—no charge whatever is imposed. The depositor of gold bullion is allowed 100 cents for every 23.22 grains Troy of pure gold his deposit may contain. A $20 gold piece if melted into a lump would be worth twenty dollars if it lost nothing in the melting. A $20 gold piece is worth twenty dollars by reason of the weight of gold in it, not by reason of the Government stamp or inscription on it. There are 23.22 grains Troy of pure gold in the gold dollar. These grains of gold, in the form of bullion, are worth a dollar at the mint or in the market. The gold obtains no increase of value in coinage. No appreciable part of its value is due to the mint's stamp, for, if melted down, the coin is worth as much as before.

AN English gentleman interested in the development of California mining properties writes this paper from London urging that influence be immediately brought to bear to have the Legislature "pass a law that every mine owner shall make monthly returns under oath, with penalty for not doing so, and let the world know what you have in the shape of productive mines, and if you are mining profitably and want capital for development you will soon get it. When I name California gold mines to any of the big investors they look doubtful. If you have mines for sale you must let it be known and what they are producing as well. In thirty minutes you can lay your hands on the returns of every mine of consequence in Africa, Australia, New Zealand, British Columbia, for every month or year. The returns in British Columbia are sworn to under a severe penalty. You have to let the public know what you are doing in mining if you want them to take any notice of your mining resources." Our correspondent overdoes the thing. In the first place California is not coaxing capital from Great Britain or elsewhere. If foreign investors don't recognize a good field that is their own greatest loss. As to advertising, while it must be confessed that we of this State are remiss in proclaiming our great gold resources, yet official statistics furnish considerable reliable information thereon. The recent bulletin of the State Mining Bureau showing California's mineral production by counties for '95 cannot be excelled as a practical and exact exhibit of the mineral wealth of the State. The suggestion that a law be passed making mine owners furnish "monthly returns under oath," is ridiculous, viewed from a local standpoint.

Separation of Silver from Gold by Volatilization.*

By Dr. Joseph W. Richards.

In making the quantitative blowpipe assay for gold and silver, it is usual to treat 100 milligrams of ore at a single fusion, yielding buttons which are too small to be weighed accurately, but whose weight must be found by measuring carefully their horizontal diameters.

As determined by Plattner (and often verified in the writer's experience), silver buttons weigh 0.6346 of the weight of spheres of silver of the same diameter as measured, and gold buttons 0.7506 of the weight of gold spheres. The buttons obtained usually weigh 0.5 to 1.5 milligrams, and the separation of the silver from the gold in buttons so small is a matter of considerable difficulty. Plattner remarks that no satisfactory method of separation in the dry way is known, and recommends the parting by nitric acid. Working, however, with buttons smaller than pin-heads, it is extremely difficult to boil two or three times with nitric acid, to wash until the silver salt is all removed, and then to gather and melt down the gold, without losing a considerable proportion of the gold in three or four directions.

Knowing that, on long heating, silver gives a coating of oxide on charcoal, and that gold does not, I made experiments to determine whether silver could be thus separated from gold, and have found the method practicable. On heating to a bright-yellow heat (not to whiteness) upon charcoal an alloy of gold and silver, before a sharp-pointed oxidizing flame, the silver volatilizes easily and steadily until there is less than five per cent of silver remaining in the gold. I estimate this volatilization to take place a little above the melting point of copper, say at 1000–1200° C. To remove the remainder of the silver, the heat is raised nearly to whiteness, or to about the melting point of steel (1500° C.). When the silver is entirely eliminated, the gold, at this temperature, begins to volatilize also; in fact, a trace of gold will be carried off with the last of the silver, and if the ash of the charcoal be white it will show a faint crimson coating close to the assay. When this coating is heavy enough to be seen without the use of a lens, the silver has been completely volatilized and the remaining button is pure gold. The amount of gold necessary to give this coating is too small to be determined by weighing or measuring.

Having explained the principle made use of, I will give the further details of conducting the operation. The charcoal should be dense, so as not to burn away too quickly. Too light a charcoal will not stand the five or ten minutes' application to the oxidizing flame without burning through the piece. It should also leave a white ash under the oxidizing flame, so as to furnish a background on which to see the crimson gold coating which determines the end of the operation. It is well, also, to work with a porcelain saucer, or large sheet of clean paper, under the flame, to catch the button in case it should be blown from the charcoal.

In order to perform this separation without excessive exertion, I would recommend that a gas flame not over two centimeters high be used, that the tip of the blowpipe be advanced at least half way through the flame and inclined somewhat sharply downwards, at an angle of about 45°. By observing these simple directions, a very sharp-pointed, needle-like oxidizing flame will be produced, about one centimeter in length to the blue tip, which I have found the best for the purpose in view. To produce this the blowing need not be strong, but it should be kept up steadily. The button, in a shallow cavity near the end of the stick of charcoal, is now brought directly in front of the point of the flame, at about one to two millimeters from the visible blue tip. Its position, of course, is regulated by the temperature observed. The button should not, at this stage, be heated to whiteness, else the silver will boil and cause a loss by sputtering. The charcoal is held inclined towards the flame at an angle of about 30°, so that the flame descends almost vertically upon the button, and thus decreases the liability of its displacement by the force of the blast.

It will be found practicable to continue a blowing for about three minutes without discomfort, at the end of which time the operator may stop to observe the color of the button. Supposing the alloy, on parting, to have been white, it will usually become pale yellow in from three to six minutes. When the alloy exhibits a brass-yellow color, the heat should be raised, and the next blowing continued for not over two minutes. At the end of this time the alloy will usually exhibit nearly the pure gold color, but no gold coating, or, at most, only a trace of it will be seen on the charcoal. After this, the heat should be raised to nearly whiteness, and then continued for not over a minute at a time. If a faint gold coating appears, further heating for one minute will usually develop a distinct crimson coating, visible without the lens, and the alloy will show the pure gold color. It is then taken out, cupelled and weasured.

If the amount of gold present be very small, it is difficult to continue volatilizing silver after the button gets smaller than one-fourth millimeter in diameter. The difficulty is caused by the ash of the charcoal, which, fusing to a slag, envelopes the button. To continue the removal of the silver, should the button arrive at this size without showing the gold color, the operator cupels and measures a pure gold button of about the same size and adds it to the button being treated. The enlarged button is now worked down to pure gold, as before, removed, cupelled and measured. The weight of gold obtained is diminished by the amount added, the difference giving that in the ore.

If the heating to incipient whiteness be continued two or three minutes after the visible gold coating is obtained, a very pretty gold coating of bright, peach-blossom color is obtained, and a sensible amount of gold is lost by volatilization. A pure gold button, one millimeter in diameter, weighing 7.58 milligrams, lost 0.03 milligrams (0.4 per cent) each minute that it was heated to whiteness, and in five minutes gave a beautiful crimson coating. A silver button of similar size lost 18 per cent of its weight, each minute, at only a bright-yellow heat. I estimate the point at which gold begins to volatilize as about the melting-point of soft steel (1500° C.). It is certainly considerably below the melting-point of platinum (1775° C.).

In conclusion, I wish to say that I have tested this method of separation in many different ways, with large and small buttons, and upon alloys rich and poor in gold, and have found the separation to be absolute when the conditions above described are properly observed. I have repeatedly alloyed a gold button with different amounts of silver, and then driven off the silver, the button, after two or three of such separations, remaining of exactly the same size and weight as at the start. In proposing this method of separation, I do not wish to disguise the fact that, to ensure success, it demands a steady hand and an experienced operator, and some practice; but I believe that anyone who has mastered the art of blowpiping sufficiently to make gold and silver assays, can, in a short time, master this method of separating the gold and silver.

[In the discussion of the above paper, it was suggested that the method might be practicable in the ordinary assay of gold and silver, as, at assay offices, if an electrically heated furnace could be devised, in which the buttons could be placed on suitable supports, and kept at the proper temperature to volatilize silver, with a current of air passing over them. The movement to the hottest part of the furnace would suffice to remove the last traces of silver, just as the last traces of lead are removed in cupellation in an ordinary muffle. The process of removing the silver would then resemble cupellation in its general outlines, except that the temperature would be about 300° to 500° higher.]

Reduction of Ores in Mexico.

To the Editor:—All over this country ores are crushed in old-fashioned one-wheel Chilean mills, driven by three mules for three hours thus nine to a mill, the ore fed and screened by hand, and ground fine in arrastras by one mule, changed every six hours, two mules to one arrastra. Capacity of mill, 3 to 3½ tons per 12 to 14 hours shift, at a cost of $1 per ton; capacity of arrastra, 600 to 800 pounds of ore, taken from mill 4 to 5 mesh fine; cost, $4 per ton; revolutions in both cases about two per minute for 80-mesh product. Thus, while the preparing for treatment costs $5 and the ore from a mine $10 per ton to be taken out and brought to the mill, the cost of the patio ($5 per ton) may be considered a fair average; total, $20 per ton. There is no doubt that, with proper mining, the expense on a ton of ore can be reduced by one-half, and the same with modern methods of crushing and grinding the ore. A four-wheel (five tons each) Chilean mill, at 12 to 15 revolutions, requires as many H. P. and will grind to 80-mesh fine 15 to 20 tons in 24 hours; 300 pounds of wood per ton is an approximate estimate of fuel required; 40 to 50 cents is the cost of this quantity of wood. Should 40 to 50 cents more be reckoned for amortisation of plant, $1 per ton would be the total cost for the whole procedure of crushing and grinding fine, which now costs $5 per ton. With the treatment in the patio similar economies could be made. During 350 years of working mines all over this Republic, there are found scattered immense quantities of such ores, worthless now, which, if turned to advantage, could easily be made profitable. In some localities modern hoisting machinery up to 600 H. P. is on the ground, ready for use. Assay values generally go over $10 to $12 per ton, gold and silver; cost of treatment amounting to $5 to $6 per ton, would leave a profit of 50 per cent on high values on properties that have lain idle for years and are liable to do so. There need be no risk, for, low as silver is, modern methods would make the work profitable. The gold associated with the silver generally alone will pay all expense. For lixiviation, coarser grinding, at correspondingly less cost, allows of the treatment of less free-milling ores cheaper than amalgamation for many ores, especially in the northern parts of Mexico.

Plain Talk on Ore Testing.*

By a Retired Assayer.

There are men in every line of business who differ greatly upon the principles underlying that special branch and the method under which it should be conducted. Some are honest in their differences, while others are willing to sacrifice their real opinions to any matter of expediency which promises more ready and full returns of cash to their coffers. There are assayers who believe the prospector should be "encouraged" by overstating the value of his ore and who habitually give small returns, from a "trace" to a few dollars per ton, upon ore which they know to be totally barren, thinking by this fraud to keep the miner at work for days, or perhaps months, upon a prospect which will yield nothing, spending valuable time and money to no purpose, save that of giving a few dollars' worth of work to the assayer. Perhaps the prospector sends samples to two different assayers, and one returns him "no trace," while the other gives him a value of a few dollars per ton. The biggest return is almost invariably accepted as correct and the "no trace" man is charged with a failure. Some assayers say it makes no difference whether they return "no trace" or a dollar or two a ton, because in neither case is the ore of any value. I claim the contrary and assert that the accuracy of an assay of ore of very low grade is much more important than that of an ore carrying a hundred dollars per ton, for the reason that in the first case a difference between "no trace" and a dollar or two may decide the expenditure of hundreds or perhaps thousands of dollars in development; while in the latter the ore will be shipped anyway; and we have all learned that the smelters will pay for nothing but the actual contents of the ore. Then, too, these returns of value from valueless ore are often the result of accident or carelessness in the hands of an assayer who has every intention of being honest. A particle of rich ore in the grinder left from the last sample, a salted crucible, a loaded cleaning brush, a dirty mixing cloth, fluxes containing a little precious metal, these and other matters of carelessness, uncleanliness or disorder about the laboratory, are continually making the difference between reliability and worthlessness in the result of assaying. The general public is not competent to judge of the qualifications of an assayer any more than those of a physician. Any man may buy an outfit for a hundred dollars and stick out his shingle "Chemist and Assayer," when in reality he knows no more about the correct application of the principles underlying the trade he professes than the man in the moon. Such instances are more common than many would believe, and sometimes people of intelligence, who would at once realize the foolishness of hunting out the cheapest lawyer or doctor, will give their patronage to such an assayer just because they can get his services a little cheaper than those of a man who is competent in his profession and who realizes the importance of taking pains.

A good assayer is often charged with failure because his customer is ignorant of the first principles of sampling ore. Sometimes a piece of rock is broken in two, the halves sent to different assayers, widely varying results are obtained, and one of the operators is charged with error, when in fact both are correct, and the results are chargeable to the fact that the metal was unevenly disseminated through the sample. It is well to remember that like results can only be reasonably expected when the sample is finely crushed, thoroughly mixed and carefully divided. The careful miner will treat his sample in this way, grinding as fine as his circumstances will permit, mixing and dividing carefully, and in every case reserving a portion of the sample, so that a check assay can be made, if desired. As the best men are liable to an occasional mistake, no conservative miner will expend any large amount of labor or money upon the result of a single assay, but will base his future work upon the concurring results of two or more reliable assayers.

The best practical test of the qualifications of an assayer is his ability to check with the smelters on their shipment pulps, and, if you are in doubt with whom to trust your work, go to your friends who are ore shippers and get them to tell you who they patronize. No man can be honest in this business without making enemies among those customers who have had higher assays elsewhere than he can give them, and who had rather believe their assayer dishonest or incompetent than that their ore is less valuable than they hoped. Remember that good men as a rule can get a fair price for their work. I have in mind an assayer in Colorado who probably does more business than any man in the West, and who charges $2 for a gold and silver assay while others in the same town charge 50 cents, and the chances are that, considering the real value of the results turned out, the $2-man comes the nearer to earning his fee. If there is any trade in which "cheap and nasty" work is utterly valueless, it is in that of the assayer.

Electrical Progress.

The 35-Mile Electrical Power Transmission at Fresno, Cal.

Fresno, the commercial center of the San Joaquin valley, this State, was recently the scene of the completion of a great work, having for result the electrical transmission commercially over

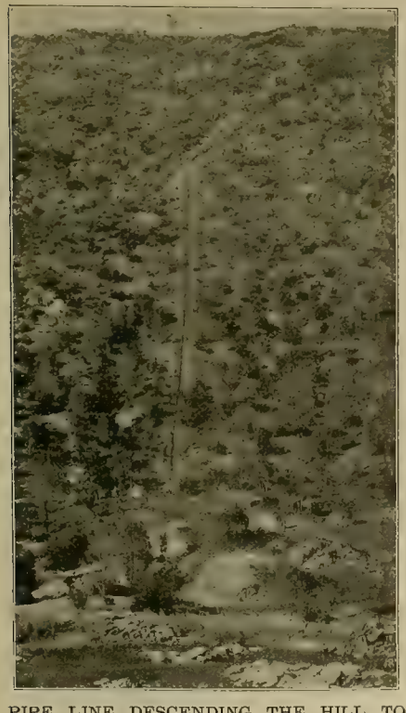
THE POLE LINE.

the longest distance yet attempted of power generated by an artificial fall of water unique in its creation and height.

Not until the successful solution of the problem of long distance power transmission had been reached did the utilization of the San Joaquin river become possible. The San Joaquin Electric Co. adopted the General Electric Company's project and three-phase system of transmission, by which power had already been successfully transmitted from Folsom to Sacramento, a distance of twenty-four miles. The work is now practically complete.

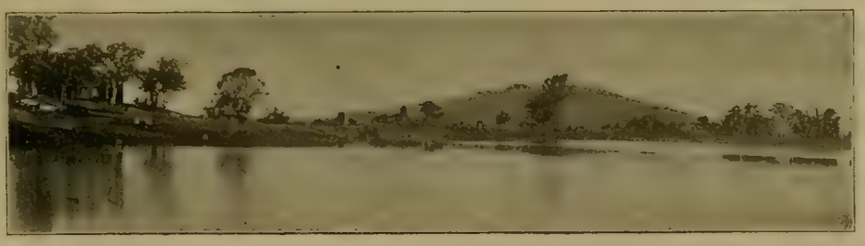
The Hydraulic Plant.—The source of the water power is the North Fork of the San Joaquin, which at the point of diversion runs through a narrow canyon with solid rock walls. The minimum low water flow of the stream at this point is 50 cubic feet per second, which at the head used will develop over 7000 horse power at the water wheels.

From the point of diversion a flume



PIPE LINE DESCENDING THE HILL TO THE POWER HOUSE.

has been built and a canal excavated and carried along the slopes of a hill for a distance of seven miles.



RESERVOIR.

They run along a right of way cleared of all obstructions for a width of 150 feet. The grade is 5.28 feet to the mile, and the lower bank forms a roadway for the inspection wagons. As usual in California valleys, the entire system of headworks and canal is unaffected by frost.

At the end of the canal is a natural basin several acres in extent surrounded for about three-quarters of its distance by a dyke of rock, which, for an expenditure of less than $3000, has been continued in an embankment for the remaining distance and a reservoir for storage water formed which at a maximum depth of only ten feet will be sufficient to operate the plant at full load for several days consecutively. This provision will allow of the ditch and flume being shut off in case of repair or changes.

POWER HOUSE, SHOWING END OF PIPE LINE AND RECEIVER OVER PELTON WHEELS.

The reservoir is located at the top of a high hill, the river being some 1600 feet below. From the pressure box in the reservoir the pipe line, 4100 feet long, is brought down the mountain side, and in this distance the difference in level between the water in the canal and the water in the river below is over 1400 feet. For the first 400 feet the pipe is steel riveted; the balance is lap welded pipe, with lock joints, and at the lower end is $\frac{5}{8}$ of an inch thick by 22 inches in diameter.

At the power house the pipe enters a receiver 57 feet long by 30 inches in diameter, of $\frac{3}{4}$-inch steel, with joints of the butt strap type. This receiver is designed to stand a working pressure of 800 pounds to the square inch.

The power house at the bottom of the hill is built of native granite, with a wooden roof. It is 75 feet long by 30 feet wide and is built on a solid bed rock. The receiver and water wheels are outside the main power house, the shafts passing through a heavy granite wall, which effectually keeps all water and moisture out of the dynamo room.

The water wheels are of Pelton make, 57 inches in diameter, each capable of developing 500 H. P. at 600 revolutions per minute under an effective head of 1400 feet, the highest head ever used for power transmission purposes. The wheels are constructed with steel plate centers and bronze buckets, and are fitted with fly wheels 5 feet in diameter. Separate wheels are provided for the exciters. The wheels which drive the generators are provided with Pelton differential governors.

The Electric Plant.—The electric plant consists of three General Electric three-phase generators, each of 350 kilowatts capacity at a speed of 600 revolutions. The armatures are directly connected to the water wheels by insulated flange couplings. The exciters are of the slow speed multipolar type. The current from the generators is delivered to six 125 K. W. step-up transformers of the General Electric air blast type, with secondaries wound for 11,200 volts, to which pressure the current in the transmission line is raised. Provision is left in the generator room for three more transformers of similar capacity. From the transformers the current passes to the switchboard, which consists of six panels, three of which are generator panels, one exciter panel and the other two operate the combination of the six transformers and carry special high tension line switches.

The 11,200 volt circuit, consisting of six bare copper wires, leaves the power house at the upper end, runs up the stream a few hundred feet, crosses the San Joaquin river with a span of 275 feet wide, and is then led up the mountain for a distance of about 2000 feet. The line continues for about ten miles through a rolling, hilly country, easy of access and at all times below the snow line; the rest of the line runs over a flat country and near Fresno passes through wheat fields and vineyards and follows a special right of way and wagon road for the entire distance. The total length of the transmission line from the power house to the sub-station is little short of thirty-five miles, and is thus the longest commercial electric power transmission in the world. The line is strung on special high tension porcelain insulators, made in the porcelain works of the General Electric Company, tested under 27,000 volts, alternating, before shipment. The poles are square redwood, 35 feet long, set 6 feet into the ground and fitted with three heavy cross arms and one small cross arm for telephone wires. As a model of pole line construction the

SWITCHBOARD IN THE POWER HOUSE.

Separation of Silver from Gold by Volatilization.*

By Dr. Joseph W. Richards.

In making the quantitative blowpipe assay for gold and silver, it is usual to treat 100 milligrams of ore at a single fusion, yielding buttons which are too small to be weighed accurately, but whose weight must be found by measuring carefully their horizontal diameters.

As determined by Plattner (and often verified in the writer's experience), silver buttons weigh 0.6346 of the weight of spheres of silver of the same diameter as measured, and gold buttons 0.7506 of the weight of gold spheres. The buttons obtained usually weigh 0.5 to 1.5 milligrams, and the separation of the silver from the gold in buttons so small is a matter of considerable difficulty. Plattner remarks that no satisfactory method of separation in the dry way is known, and recommends the parting by nitric acid. Working, however, with buttons smaller than pin-heads, it is extremely difficult to boil two or three times with nitric acid, to wash until the silver salt is all removed, and then to gather and melt down the gold, without losing a considerable proportion of the gold in three or four directions.

Knowing that, on long heating, silver gives a coating of oxide on charcoal, and that gold does not, I made experiments to determine whether silver could be thus separated from gold, and have found the method practicable. On heating to a bright-yellow heat (not to whiteness) upon charcoal an alloy of gold and silver, before a sharp-pointed oxidizing flame, the silver volatilizes easily and steadily until there is less than five per cent of silver remaining in the gold. I estimate this volatilization to take place a little above the melting point of copper, say at 1000–1200° C. To remove the remainder of the silver, the heat is raised nearly to whiteness, or to about the melting point of steel (1500° C.). When the silver is entirely eliminated, the gold, at this temperature, begins to volatilize also; in fact, a trace of gold will be carried off with the last of the silver, and if the ash of the charcoal be white it will show a faint crimson coating close to the assay. When this coating is heavy enough to be seen without the use of a lens, the silver has been completely volatilized and the remaining button is pure gold. The amount of gold necessary to give this coating is too small to be determined by weighing or measuring.

Having explained the principle made use of, I will give the further details of conducting the operation. The charcoal should be dense, so as not to burn away too quickly. Too light a charcoal will not stand the five or ten minutes' application to the oxidizing flame without burning through the piece. It should also leave a white ash under the oxidizing flame, so as to furnish a background on which to see the crimson gold coating which determines the end of the operation. It is well, also, to work with a porcelain saucer, or large sheet of clean paper, under the flame, to catch the button in case it should be blown from the charcoal.

In order to perform this separation without excessive exertion, I would recommend that a gas flame not over two centimeters high be used, that the tip of the blowpipe be advanced at least half way through the flame and inclined somewhat sharply downwards, at an angle of about 45°. By observing these simple directions, a very sharp-pointed, needle-like oxidizing flame will be produced, about one centimeter in length to the blue tip, which I have found the best for the purpose in view. To produce this the blowing need not be strong, but it should be kept up steadily. The button, in a shallow cavity near the end of the stick of charcoal, is now brought directly in front of the point of the flame, at about one to two millimeters from the visible blue tip. Its position, of course, is regulated by the temperature observed. The button should not, at this stage, be heated to whiteness, else the silver will boil and cause a loss by sputtering. The charcoal is held inclined towards the flame at an angle of about 30°, so that the flame descends almost vertically upon the button, and thus decreases the liability of its displacement by the force of the blast.

It will be found practicable to continue a blowing for about three minutes without discomfort, at the end of which time the operator may stop to observe the color of the button. Supposing the alloy, on starting, to have been white, it will usually become pale yellow in from three to six minutes. When the alloy exhibits a brass-yellow color, the heat should be raised, and the next blowing continued for not over two minutes. At the end of this time the alloy will usually exhibit nearly the pure gold color, but no gold coating, or, at most, only a trace of it will be seen on the charcoal. After this, the heat should be raised to nearly whiteness, and then continued for not over a minute at a time. If a faint gold coating appears, further heating for one minute will usually develop a distinct crimson coating, visible without the lens, and the alloy will show the pure gold color. It is then taken out, cupelled and measured.

If the amount of gold present be very small, it is difficult to continue volatilizing silver after the button gets smaller than one-fourth millimeter in diameter. The difficulty is caused by the ash of the charcoal, which, fusing to a slag, envelopes the button. To continue the removal of the silver, should the button arrive at this size without showing the gold color, the operator cupels and measures a pure gold button of about the same size and adds it to the button being treated. The enlarged button is now worked down to pure gold, as before, removed, cupelled and measured. The weight of gold obtained is diminished by the amount added, the difference giving that in the ore.

If the heating to incipient whiteness be continued two or three minutes after the visible gold coating is obtained, a very pretty gold coating of bright, peach-blossom color is obtained, and a sensible amount of gold is lost by volatilization. A pure gold button, one millimeter in diameter, weighing 7.58 milligrams, lost 0.03 milligrams (0.4 per cent) each minute that it was heated to whiteness, and in five minutes gave a beautiful crimson coating. A silver button of similar size lost 18 per cent of its weight, each minute, at only a bright-yellow heat. I estimate the point at which gold begins to volatilize as about the melting-point of soft steel (1500° C.). It is certainly considerably below the melting-point of platinum (1775° C.).

In conclusion, I wish to say that I have tested this method of separation in many different ways, with large and small buttons, and upon alloys rich and poor in gold, and have found the separation to be absolute when the conditions above described are properly observed. I have repeatedly alloyed a gold button with different amounts of silver, and then driven off the silver, the button, after two or three of such separations, remaining of exactly the same size and weight as at the start. In proposing this method of separation, I do not wish to disguise the fact that, to ensure success, it demands a steady hand and an experienced operator, and some practice; but I believe that anyone who has mastered the art of blowpiping sufficiently to make gold and silver assays, can, in a short time, master this method of separating the gold and silver.

[In the discussion of the above paper, it was suggested that the method might be practicable in the ordinary assay of gold and silver, as, at assay offices, if an electrically heated furnace could be devised, in which the buttons could be placed on suitable supports, and kept at the proper temperature to volatilize silver, with a current of air passing over them. The movement to the hottest part of the furnace would suffice to remove the last traces of silver, just as the last traces of lead are removed in cupellation in an ordinary muffle. The process of removing the silver would then resemble cupellation in its general outlines, except that the temperature would be about 300° to 500° higher.]

Plain Talk on Ore Testing.*

By a Retired Assayer.

There are men in every line of business who differ greatly upon the principles underlying that special branch and the method under which it should be conducted. Some are honest in their differences, while others are willing to sacrifice their real opinions to any matter of expediency which promises more ready and full returns of cash to their coffers. There are assayers who believe the prospector should be "encouraged" by overstating the value of his ore and who habitually give small returns, from a "trace" to a few dollars per ton, upon ore which they know to be totally barren, thinking by this fraud to keep the miner at work for days, or perhaps months, upon a prospect which will yield nothing, spending valuable time and money to no purpose, save that of giving a few dollars' worth of work to the assayer. Perhaps the prospector sends samples to two different assayers, and one returns him "no trace," while the other gives him a value of a few dollars per ton. The biggest return is almost invariably accepted as correct and the "no trace" man is charged with a failure. Some assayers say it makes no difference whether they return "no trace" or a dollar or two a ton, because in neither case is the ore of any value. I claim the contrary and assert that the accuracy of an assay of ore of very low grade is much more important than that of an ore carrying a hundred dollars per ton, for the reason that in the first case a difference between "no trace" and a dollar or two may decide the expenditure of hundreds or perhaps thousands of dollars in development; while in the latter the ore will be shipped anyway; and we have all learned that the smelters will pay for nothing but the actual contents of the ore. Then, too, these returns of value from valueless ore are often the result of accident or carelessness in the hands of an assayer who has every intention of being honest. A particle of rich ore in the grinder left from the last sample, a salted crucible, a loaded cleaning brush, a dirty mixing cloth, fluxes containing a little precious metal, these and other matters of carelessness, uncleanliness or disorder about the laboratory, are continually making the difference between reliability and worthlessness in the result of assaying. The general public is not competent to judge of the qualifications of an assayer any more than those of a physician. Any man may buy an outfit for a hundred dollars and stick out his shingle "Chemist and Assayer," when in reality he knows no more about the correct application of the principles underlying the trade he professes than the man in the moon. Such instances are more common than many would believe, and sometimes people of intelligence, who would at once realize the foolishness of hunting out the cheapest lawyer or doctor, will give their patronage to such an assayer just because they can get his services a little cheaper than those of a man who is competent in his profession and who realizes the importance of taking pains.

A good assayer is often charged with failure because his customer is ignorant of the first principles of sampling ore. Sometimes a piece of rock is broken in two, the halves sent to different assayers, widely varying results are obtained, and one of the operators is charged with error, when in fact both are correct, and the results are chargeable to the fact that the metal was unevenly disseminated through the sample. It is well to remember that like results can only be reasonably expected when the sample is finely crushed, thoroughly mixed and carefully divided. The careful miner will treat his sample in this way, grinding as fine as his circumstances will permit, mixing and dividing carefully, and in every case reserving a portion of the sample, so that a check assay can be made, if desired. As the best men are liable to an occasional mistake, no conservative miner will expend any large amount of labor or money upon the result of a single assay, but will base his future work upon the concurring results of two or more reliable assayers.

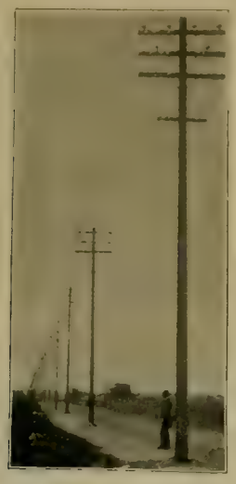
The best practical test of the qualifications of an assayer is his ability to check with the smelters on their shipment pulps, and, if you are in doubt with whom to trust your work, go to your friends who are ore shippers and get them to tell you who they patronize. No man can be honest in this business without making enemies among those customers who have had higher assays elsewhere than he can give them, and who had rather believe their assayer dishonest or incompetent than that their ore is less valuable than they hoped. Remember that good men as a rule can get a fair price for their work. I have in mind an assayer in Colorado who probably does more business than any man in the West, and who charges $2 for a gold and silver assay while others in the same town charge 50 cents, and the chances are that, considering the real value of the results turned out, the $2-man comes the nearer to earning his fee. If there is any trade in which "cheap and nasty" work is utterly valueless, it is in that of the assayer.

*Northwest Mining.

Electrical Progress.

The 35-Mile Electrical Power Transmission at Fresno, Cal.

Fresno, the commercial center of the San Joaquin valley, this State, was recently the scene of the completion of a great work, having for result the electrical transmission commercially over



THE POLE LINE.

the longest distance yet attempted of power generated by an artificial fall of water unique in its creation and height.

Not until the successful solution of the problem of long distance power transmission had been reached did the utilization of the San Joaquin river become possible. The San Joaquin Electric Co. adopted the General Electric Company's project and three-phase system of transmission, by which power had already been successfully transmitted from Folsom to Sacramento, a distance of twenty-four miles. The work is now practically complete.

The Hydraulic Plant.—The source of the water power is the North Fork of the San Joaquin, which at the point of diversion runs through a narrow canyon with solid rock walls. The minimum low water flow of the stream at this point is 50 cubic feet per second, which at the head used will develop over 7000 horse power at the water wheels.

From the point of diversion a flume

PIPE LINE DESCENDING THE HILL TO THE POWER HOUSE.

has been built and a canal excavated and carried along the slopes of a hill for a distance of seven miles. They run along a right of way cleared of all obstructions for a width of 150 feet. The grade is 5.28 feet to the mile, and the lower bank forms a roadway for the inspection wagons. As usual in California valleys, the entire system of headworks and canal is unaffected by frost.

At the end of the canal is a natural basin several acres in extent surrounded for about three-quarters of its distance by a dyke of rock, which, for an expenditure of less than $3000, has been continued in an embankment for the remaining distance and a reservoir for storage water formed which at a maximum depth of only ten feet will be sufficient to operate the plant at full load for several days consecutively. This provision will allow of the ditch and flume being shut off in case of repair or changes.

RESERVOIR.

POWER HOUSE, SHOWING END OF PIPE LINE AND RECEIVER OVER PELTON WHEELS.

The reservoir is located at the top of a high hill, the river being some 1600 feet below. From the pressure box in the reservoir the pipe line, 4100 feet long, is brought down the mountain side, and in this distance the difference in level between the water in the canal and the water in the river below is over 1400 feet. For the first 400 feet the pipe is steel riveted; the balance is lap welded pipe, with lock joints, and at the lower end is $\frac{5}{8}$ of an inch thick by 22 inches in diameter.

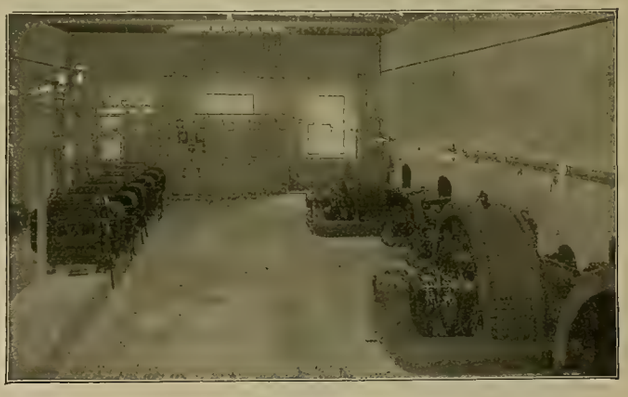
At the power house the pipe enters a receiver 57 feet long by 30 inches in diameter, of $\frac{3}{4}$-inch steel, with joints of the butt strap type. This receiver is designed to stand a working pressure of 800 pounds to the square inch.

The power house at the bottom of the hill is built of native granite, with a wooden roof. It is 75 feet long by 30 feet wide and is built on a solid bed rock. The receiver and water wheels are outside the main power house, the shafts passing through a heavy granite wall, which effectually keeps all water and moisture out of the dynamo room.

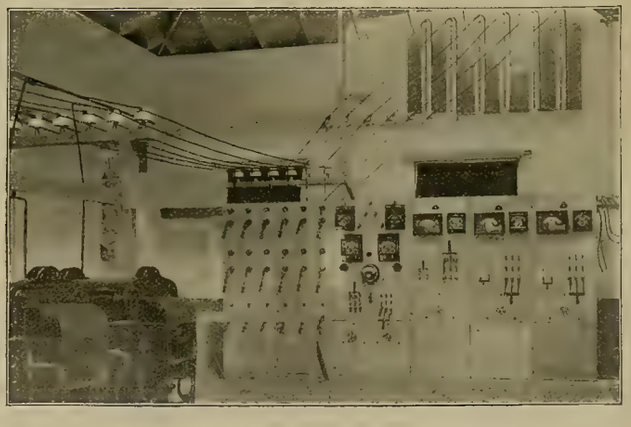
The water wheels are of Pelton make, 57 inches in diameter, each capable of developing 500 H. P. at 600 revolutions per minute under an effective head of 1400 feet, the highest head ever used for power transmission purposes. The wheels are constructed with steel plate centers and bronze buckets, and are fitted with fly wheels 5 feet in diameter. Separate wheels are provided for the exciters. The wheels which drive the generators are provided with Pelton differential governors.

The Electric Plant.—The electric plant consists of three General Electric three-phase generators, each of 350 kilowatts capacity at a speed of 600 revolutions. The armatures are directly connected to the water wheels by insulated flange couplings. The exciters are of the slow speed multipolar type. The current from the generators is delivered to six 125 K. W. step-up transformers of the General Electric air blast type, with secondaries wound for 11,200 volts, to which pressure the current in the transmission line is raised. Provision is left in the generator room for three more transformers of similar capacity. From the transformers the current passes to the switchboard, which consists of six panels, three of which are generator panels, one exciter panel and the other two operate the combination of the six transformers and carry special high tension line switches.

The 11,200 volt circuit, consisting of six bare copper wires, leaves the power house at the upper end, runs up the stream a few hundred feet, crosses the San Joaquin river with a span of 275 feet wide, and is then led up the mountain for a distance of about 2000 feet. The line continues for about ten miles through a rolling, hilly country, easy of access and at all times below the snow line; the rest of the line runs over a flat country and near Fresno passes through wheat fields and vineyards and follows a special right of way and wagon road for the entire distance. The total length of the transmission line from the power house to the sub-station is little short of thirty-five miles, and is thus the longest commercial electric power transmission in the world. The line is strung on special high tension porcelain insulators, made in the porcelain works of the General Electric Company, tested under 27,000 volts, alternating, before shipment. The poles are square redwood, 35 feet long, set 6 feet into the ground and fitted with three heavy cross arms and one small cross arm for telephone wires. As a model of pole line construction the



INTERIOR OF GENERATOR ROOM.



SWITCHBOARD IN THE POWER HOUSE.

Fresno transmission line can compare favorably with any pole line work done in the country.

The sub-station at Fresno is almost in the center of the business portion of the city, and is a brick structure 55 feet by 45 feet. The high pressure circuits entering the house are brought to nine step-down transformers, also of the air blast type. Three of these are of 125 K. W. capacity and reduce the pressure to 200 volts; three of 75 K. W. capacity, with secondaries of 1000 volts, and three are of 40 K. W. capacity, reducing the pressure to 3000 volts. In addition to these transformers the station also contains two 80-light Brush arc machines directly driven by two 60 H. P. three-phase induction motors.

The system of distribution from the sub-station is divided up into three networks. The first, a 200-volt, four-wire, low-tension network, which covers the business portions of the town and having an initial capacity of 6000 16 C. P. incandescent lamps; the second, a 1000-volt, three-phase system, covering the residence districts of the town and having an initial capacity of 4000 16 C. P. incandescent lamps; the third, a 3000-volt, three-phase circuit, designed to furnish current to the numerous vineyards and wineries within a radius of ten miles from the sub-station, for both lighting and power purposes. Motors will also be furnished with current from both the 200 volt and 1000 volt systems.

The policy of the operating company is of a broad gauge character, the end in view being the stimulation of the use of electric power. To effect this end prices are made which compare favorably with that charged for power where steam coal is used.

Electric Furnace.

In the blast furnace method of reducing iron the metal takes up impurities, such as sulphur and silicon, and these are not entirely removed in subsequent treatment by the Bessemer or Martin process. The present methods of smelting must hold the field for ordinary grades of iron; but when purity is of importance, and when special qualities of steel are required, it will probably prove advantageous to prepare pure iron by electrical methods of reduction and to carbonize this subsequently. A furnace suitable for this and similar purposes is described. It is lined, says the American *Manufacturer*, with a basic lining, like a Bessemer converter; this is non-conducting and almost infusible, and keeps the iron free from impurities. In the Heroult furnace used at Neuhausen the positive carbon is vertical, and the material to be fused has to be introduced into the narrow space between this and the walls of the furnace. It is preferable to have a positive electrode consisting of four carbons arranged symmetrically about a vertical axis and inclined at about 20° to it. These can be raised so as to produce an electric arc, or lowered so as to dip into the fused mass; they can also be rotated backward and forward so as to insure a uniform distribution of the heat. The bottom of the furnace is insulated and forms the negative electrode.

An electric process of converting emery into corundum by means of the alternate current arc has recently been patented, says the *Trade Journal Review*. As heat, and not decomposition, is aimed at, continuous currents would be unsuitable. The furnace is made of firebricks and stands on two bridges; the hollow underneath serves as receptacle for the fused mass, there being a small hole in the bottom of the furnace. This hole is covered with a glass plate. The electrodes (carbon rods) are approached to within 1 to 2 inches, the space between being packed with lumps of carbon. The emery, the finest dust, of little use otherwise, is mixed with powdered coal, the amount depending upon the iron oxide in the emery; for 25 per cent of oxide 5 per cent of carbon is reckoned. The coal is soon burned by the oxygen of the iron oxide and the arc forms. The inner mass begins to melt, the glass plate gives way and a stream of fused corundum flows out. The hard outer crust is then broken with iron rods and new material thus fed to the arc. This addition stops the flow, which starts again after 10 or 15 minutes. The baseplate is strewn with fine emery powder, to protect it from the intense heat of the fused mass. The resulting corundum is almost free of water, of which the emery contains about 5 per cent.

Scientific Progress.

Relative Abundance of the Elements.

F. W. Clark has made extensive calculations of the relative abundance of the chemical elements in the earth's crust, the waters, and the air, and reported the results of his work to the U. S. Geological Survey.

In the crust of the earth, with its liquid and gaseous envelopes, seventy-one chemical elements are at present recognized. Others, as yet unknown, are indicated by gaps in the periodic system and will probably be discovered in the future Some of the elements are quite plentiful, and some are exceedingly rare. Nothing is known of the earth's interior. Its surface only is within our certain reach, and from the composition of that we must draw nearly all our conclusions. The average crust of the earth is computable, and Mr. Clark's calculation gives results which are in some respects surprising.

In order to have a definite mass under consideration, he assumes for the earth's known crust a thickness of ten miles below sea-level. The volume of that crust, including the mean elevation of the continents above the sea, is 1,935,000,000 cubic miles. Of this amount 302,000,000 cubic miles are ocean and 1,633,000,000 are solid matter. The mass of the atmosphere is equivalent to that of 1,268,000 cubic miles water, the unit of density. From this data it is computed that the earth's crust, to a depth of ten miles, is composed essentially of 93 per cent solid and 7 per cent liquid matter.

From a large number of analyses, and a mass of corroborative evidence, Mr. Clark deduces the following table of the relative abundance of the more common elements. Quantities less than 0.01 per cent are left out of consideration.

	Solid crust, 93 per cent.	*Ocean, 7 per cent.*	*Mean, including air.*
Oxygen	47.26	85.79	46.98
Silicon	27.21	.....	25.30
Aluminum	7.81	.....	7.26
Iron	5.46	.....	5.08
Calcium	3.77	.05	3.51
Magnesium	2.68	.14	2.50
Sodium	2.36	1.14	2.28
Potassium	2.40	.04	2.23
Hydrogen	.21	10.67	.94
Titanium	.33	.....	.30
Carbon	.22	.002	.21
Chlorine	0.1	2.07	.15
Bromine	....	.008	
Phosphorous	.70	.....	.09
Manganese	.08	.....	.07
Sulphur	.03+	.09	.04+
Barium	.03	.....	.03
Nitrogen	....	.....	.02
Chromium	.01	.....	.01
	100.00	100.00	100.00

Nineteen of the elements are here provided for with very varying degrees of probability, although their order in the last column is presumably correct. The uncertainty may reach one per cent in the cases of silicon and iron, one-half as much with aluminum and oxygen, and is proportionateless for the other elements specified. The remaining elements, more than fifty in number, can hardly aggregate over one per cent altogether, and not one of them could pass 0.05 per cent in relative quantity.

Soda-water cartridges or "gas drops," for making aerated water at home or wherever one may be traveling, are now being put on the market. The steel shell is pear-shaped, about ⅝-inch in diameter at the largest part, and is filled with liquid carbonic acid at a pressure of 60 atmospheres. The cartridge fits into the mouth-piece of a soda-water bottle. A cap is closed over it, and in completing the closure a tiny ebonite plug in one end of the cartridge is punctured, when the gas escapes into the bottle and is dissolved in the water. A dozen of the gas drops weigh three ounces, and 5,000 of them can be packed in a cubic foot.

Picture of a Tornado.

A photograph of a tornado is herewith reproduced from the *Engineering News*. It was taken at Oklahoma City, Oklahoma Territory, 4 P. M., May 14th. The tornado was about six miles distant when the photograph was taken, and a rough computation indicates a probable diameter of the funnel of

about 1000 feet. The print should show the sky much darker than it does, but a tornado is not an easy subject to photograph, most people who have seen one finding other things to occupy their time than taking pictures of the threatening spiral. So far as known this is the first actual photograph of a tornado ever published, and it is believed that only one other has ever been taken. This is referred to in Russell's "Meteorology" as having been secured at the Howard mines, South Dakota, on August 28th, 1884, the cloud then being twenty-two miles away. The accompanying picture as a work of art is a failure, but it may give our readers some idea of how one of those terrible visitants looks.

Photography in Colors.

The Natural Color and Photographing and Printing Company have incorporated at Richmond, Va. The process requires a specially ruled screen and paper. A multi-colored screen ruled by very fine lines, formed of dots or small particles is employed. The screen is ruled with lines in these colors, about 300 to an inch. This screen is placed in front and in close contact with an orthochromatic plate, which is then exposed in the camera to the object to be photographed. The ordinary black and white negative is thus obtained in lines corresponding to the screen in register. From this negative a positive is made in the ordinary way on glass or paper. Jas. W. McDonough of Chicago, the inventor of the process, claims that if the screen or a similarly ruled one be laid on the positive, and moved until the positive and screen are in register, the picture comes out in original colors.

Prof. Graham in 1863 thought that the three conditions of matter—liquid, solid and gaseous—probably always exist in every liquid or solid substance, but that one predominates over the others. Spring in 1886 proved that alloys may be formed by the strong compression of the finely divided constituent metals, at ordinary temperature, and in 1894 that the solid metals may be made to unite by pressure at temperatures considerably below their melting points. Continuing the experiments, Prof. Roberts-Austen has placed a solid cylinder of lead three inches long on a base of gold or gold-lead alloy, keeping them first at a temperature of 251°, or 75° below the melting point of lead, for thirty-one days. On cutting up the lead, a certain amount of gold in each section could be found. More surprising still, it was then discovered that the gold will penetrate to the top of the cylinder in appreciable quantity in three days at a temperature of 100°, and there is evidence that slow diffusion of gold in lead occurs at the ordinary temperature. There is also reason to believe that gold would diffuse in silver and copper in a similar manner. The passage of solid carbon into iron—a phenomenon long familiar to the steelmaker—is shown by Prof. Roberts-Austen's researches to be really comparable with a diffusion of salts in water, and it obeys the same laws.

American Society Civil Engineers.

The twenty-ninth annual convention of the American Society of Civil Engineers opened in the Academy of Sciences in this city at 10 A. M. last Monday, the 29th ult.—the first time the society has thus met west of the Rocky mountains. The officers of the California association—Luther Wagoner, Pres't; Marsden Manson, V. P.; Otto Von Geldern, Sec.; and G. F. Schild, Treas.—with other members of the association, met and welcomed the visiting members, who were scheduled to arrive at 20:45 o'clock, on the 28th, but who were delayed some hours. The morning session began at 10 o'clock on the 29th, the afternoon session at 1:40 o'clock. In the evening a public reception was held at 20:30 o'clock in the Palace Hotel. Tuesday morning was devoted to excursions and sight-seeing; at 20 o'clock Thos. Curtis Clarke, president American Society Civil Engineers, delivered the annual address. On Wednesday the visitors inspected some of the power houses in the city. In the evening papers were read on "Flow of Water in Wrought and Cast Iron Pipes from 28 to 42 Inches in Diameter," by Isaac W. Smith, M. Am. Soc. C. E.

"A Water Power and Compressed Air Transmission Plant for the North Star Mining Company, Grass Valley, Cal.," by A. D. Foote, M. Am. Soc. C. E.

"The Condition of Steel in Bridge Pins," by A. C. Cunningham, M. Am. Soc. C. E.

"Improving the Entrance to a Bar Harbor by a Single Jetty," by Thomas W. Symons, M. Am. Soc. C. E.

"The Construction of a Light Mountain Railroad in the Republic of Colombia," by E. J. Chibas, Associate member Am. Soc. C. E.

On Thursday the State University at Berkeley and Stanford University at Palo Alto were visited. Friday was devoted to further excursions and observations, and on Friday evening most of the visitors started eastward.

A girl who can see the Rontgen rays has been found by Dr. Brandes, of Halle. Starting from the fact that the rays do not penetrate lenses, he hunted for some one the lens of whose eyes had been removed, an operation performed not rarely for extreme short-sightedness or for cataract. The girl, who had had the lens of her left eye removed, was able to see the light with it, though her right eye, which retained its lens, could see nothing. Dr. Brandes asserts that the rays affect the retina of the eye, and if any one's head is enclosed in on opaque vessel near the source of the rays the light can be seen even with closed eyes.

The cathode rays of Crooks and Hittorf tubes can be deflected by a strong magnetic field, Herr Kr. Birkeland has found, and can even be so concentrated upon the side of the tube as to melt the glass. This leads to a new theory of the aurora borealis. Herr A. Paulsen, the Danish meteorologist, suggests that the aurora is due to phosphorescence produced by cathode rays in the upper air, and Birkeland points out the earth's magnetism may be the cause of the intensifying of the phosphorescence near the poles.

Doubling the length of a board or timber reduces the stiffness eightfold and the strength one-half. Doubling the width of a board doubles the stiffness and strength. Doubling the thickness of a board or the depth of a timber increases the stiffness about

eightfold and the strength fourfold. If, therefore, it is desired to double the length and retain the same stiffness, it is necessary to double the thickness or depth.

Mechanical Progress.

Iron Ore Mining at Lake Superior.

The practical exploitation of Lake Superior iron ores, which have developed an enormous trade, occurred about the same time the copper mines were first operated; but, beyond treating the ores in local forges, little use was made of them until the year 1856, when the first iron ore was shipped from Marquette. For a long time the range near Marquette, which bears its name, supplied all of the ore, but in 1877 the Menominee range to the south was exploited and opened for business. While this range is considered, as in the Lake Superior region, most of its ore is shipped via Lake Michigan, thus saving the delay of locking through the St. Mary's ship canal and having less detention from ice in winter. Seven years later, says John Birkenbine, the third and fourth ranges—the Gogebic in Michigan and Wisconsin and the Vermilion in Minnesota—were opened, and within the past three years another range—the Mesabi in Minnesota—has been attracting attention by the size and character of its deposits and the ease with which the ore is won. As new ranges were discovered and new mines opened, markets were found for the increased outputs, and nearly 10,500,000 tons were sent from the mines of the Lake Superior district in 1895, enormous quantities having been obtained from individual operations. Up to the close of 1895, eleven mines had each contributed totals of from 3,000,000 to 6,800,000 long tons, as much as 1,000,000 tons were produced by a single operation in one year, and for a decade the average output of one mine has been 500,000 tons per year, while several mines for shorter periods had records almost as large. The total amount of iron ore which has been won from the Lake Superior iron mines to date exceeds 100,000,000 gross tons.

Some of the hoisting plants at these mines are excellent examples of mechanical construction. The Chapin iron ore mine has a vertical compound pumping engine, with cylinders 50 and 100 inches in diameter and 10 feet stroke, designed to deliver 3,000 gallons per minute from a depth of 1,500 feet. The plunger pumps, 28 inches in diameter and 10 feet stroke, are connected to the engine through a horizontal beam, and also to a 40-feet fly-wheel weighing 160 tons.

At this same mine the entire power equipment is arranged to work either with steam or with compressed air, the latter being developed by a waterfall three miles distant and conveyed to the mine in a 30-inch wrought iron pipe laid on the surface and fitted with expansion joints. One of the shafts of the Chapin mine was sunk through quicksand by freezing the sand into solid masses, which were then blasted out.

The methods of mining iron ores vary, according to the character of the deposit, from stripping and mining with the steam shovel, to working with rock drills 1,450 feet below the surface of the earth. Some mines are wrought open cut, but the majority are operated underground, all the different methods of long-wall mining, caving, milling, overhand and underhand stoping, as well as the various systems of timbering and filling, being in active use in the iron ore mines of Lake Superior. The character of the ore also varies from soft material, easily handled by the shovel, to rock so hard as to severely test the tools and apparatus employed. Rock drills of the same size and working under similar pressures, which bored 100 to 120 feet in ten hours in the limestone of the Chicago drainage canal, could not cut more than 5 to 6 feet in hard Minnesota and 18 to 20 feet in hard Marquette ores in the same time.

A statement of the cost of mining ore at one of the large iron ore mines, from a depth of 500 feet below the surface, shows:

	Cents Per Ton.
Actual mining cost, including labor, explosives, light, etc	44
To which must be added timbering	6
Operating machinery and office expenses	6
Repairs	3½
Loading and sorting ore	3½
Insurance and other expenses	2½
A total for ore loaded on cars of	65

for all charges at the mine except royalty and interest.

Sources of Energy After Coal.

Long before the coal fields of the world are exhausted, there is little doubt the workers on the borderland of engineering will have discovered some plan of tapping the inconceivably great stores of energy around us. The very earth we live on is whirling around like a huge flywheel, and if we could only find some way of utilizing its momentum we could draw upon it for ages for all the power we want without appreciably affecting the speed of its revolution or the length of our day. It is, indeed, naturally drawn upon now in various things intimately associated with the work of the harbor and dock engineer.

The flow of the tide in enormous volumne up and down a river is accompanied by a vast expenditure of power in overcoming the frictional resistance of the river bed, in the grinding of shingle into sand and in the transport of sandbanks from one part of the river to another. Even the flow of the water through the sluices of locks involves a loss of energy, as does the working of a tide mill, which latter is one way of utilizing, as the others are of destroying, some of the earth's momentum. No true engineer will believe that with so many sources of energy around us the progress of mankind and the work of the engineer will cease with the exhaustion of our coal fields.—Cassier's Magazine, July.

SHEETS of glass in which there is a network of wire have come into use recently for skylights and other windows where large panes are desirable, and where there is a liability to breakage from flying sticks or stones. Another virtue has recently been discovered in this fabric. Such glass offers a better barrier to the progress of fire than the ordinary article does. Some tests have been made by insurance experts in Boston. A stove was constructed in the form of a fireplace, and wire-glass blowers were set up in front of it. Resinous wood, drenched with kerosene, was burned in this stove. Where the glass was very hot, cold water was thrown on it from the outside. The material was badly cracked, but it hung together. These and similar experiments in Philadelphia lead to the conclusion that in especially exposed places in the large factories wire glass is preferable to any other variety.

A NEW YORK PAPER gives the following figures relating to electrical development: The capital invested in electric lighting is put at $325,000,000; invested in private plants, $200,000,000; number of arc lights in use, 250,000; capital invested in electric mining machinery, $100,000,000; invested in 500,000 stationary electric motors, $60,000,000. Concerns that use from 50 to 100 motors each are very numerous. It is estimated that more than 90 per cent of all the street and suburban roads are operated by electricity; number of trolley cars, 25,000; total miles, 12,000; combined capital of electrical railways, $700,000,000; total investment in electrical industry is placed at $1,410,000,000, covering a period of fifteen years; number of men estimated to be employed in electrical industries, 2,500,000.

LAST Wednesday began a test in Chicago that will attract universal interest. Compressed air will be experimented upon as a street car motor, the trial to last four months on the tracks of the Chicago General Railway Co.

Practical Information.

Forests and Stream Flow.

Californians are surely interested in observations on the effects of mountain forests upon the flow of water in streams. Hitherto all the preaching has been to show that deforesting causes rapid downflow of water and destruction of lowlands, both directly by erosion and indirectly by drouth. Most telling instances of such results are familiar to all who are informed on that subject. But there are now published some observations by R. L. Fulton, a well-known citizen of Nevada, which seem to indicate that under certain conditions these results do not ensue, but that rather a contrary effect is produced. These are considered by Mr. Fulton in a communication to *Science*.

The Character of the Forest Growths.—Many close observers, after long years of study, have been led to believe that if there is any difference in the flow of streams and the size of springs before and after the trees are cut from above them, the balance is in favor of the open country. The water which drops on shaded ground which is thickly overspread with spongy leaves and the air so near the dew point that it cannot absorb much more moisture should be held back, while that coming down on open ground should run off quickly, seems very natural, but in high mountain regions there are peculiar conditions which do much to modify the action of the law. The pine and the fir are the only trees found growing at high altitudes in any abundance, and their thin needles do not make the heavy shade when on the tree, nor the thick mat when lying on the ground, that the broad leaves of the oak, beech and maple do. Instead of forming a spongy layer five or six inches thick, they are swept about by the wind, and it is not unusual to see the ground bare under the trees, and all the needles lodged somewhere in drifts. Even when they lie where they fall, the coating is comparatively worthless so far as retaining moisture is concerned.

On the other hand, the foliage on this class of trees being as heavy in winter as in summer, the branches catch an immense amount of the falling snow and hold it up in midair for both sun and air to work upon, and only those who have had experience of the absorbing power of the dry mountain air can form any idea of the loss from that source. Such as is melted falls upon that beneath, and breaking the surface sets in operation the forces which are always ready to attack such substances. The theory that the shade protects the moisture-laden soil means but little in such places.

How Trees Melt the Snow.—In a timber belt the snow fall is comparatively evenly distributed, and by the radiation and reflection of heat from its own body each particular tree immediately sets itself to work to clear the ground around it, and long before there is a vacant foot out in the open a space will be bared for several feet around each trunk.

So long as there is no color but pure white for the sun's rays to work upon, its heat is largely latent, but let a stick or straw break the surface, and it will melt the snow or ice for several times its diameter on every side, and stand alone in a few hours. Precisely the same is true upon a larger scale of every stump and tree in a forest.

Observations made at Cornell several years ago bear out this assertion that the presence of trees assists, rather than retards, the melting of the snow, it being shown that the temperature of a wooded belt is two to four degrees higher than that of an adjoining wooded field.

How the Snow Is Conserved.—The strongest force at work to save our rivers is the drifting winds which heap up the snow in great banks, and in this the trees are a constant obstacle. There will be miniature drifts, it is true, but nothing to what there are when there is no obstruction. Outside the timber belt, where there is nothing to catch the snow as it falls and nothing to break the force of the wind, one of the most powerful and active agents in preserving the water supply of a country comes into play. By forming solid bodies of snow the most effective means of saving water for summer is reached.

Observations on the Eastern Slope of the Sierra Nevada.—Among the settlers at the eastern base of the Sierra Nevada, where the timber has been cut for the Comstock mines, the majority believe that this cutting has improved both the regularity and the quantity of the water flow available for irrigation, owing to the fact just stated—the formation of large, compact drifts, which stand unmelted late into the spring. In this same connection Mr. Fulton remarks:

To attempt to hold back an adequate supply of water for a great region like that lying below the Sierra Nevada range in any except a solid state would be utterly useless. Nothing in a liquid form would tarry long on a heavy grade. No shade or mat of leaves would be strong enough to overcome the law of gravitation to that extent. Nothing could detain it but a short time at the farthest, and if it were not for the vast drifts which hold the snow in an icy grasp until late in the summer, all the horrors prophesied from spring floods and summer drouths would be realized.

Mr. Fulton asserts, in conclusion, that he is merely anxious to establish what he believes to be the truth; he is certainly no enemy of the trees. He says in his final paragraph:

In any case I do not wish to be understood as favoring the destruction of the forests of this or any other country. I never cut down a tree in my life and never saw one fall without feeling that I had lost a friend. Whatever is proven, there will always be abundant reasons for preserving extensive tracts of woodland everywhere that trees will grow, and it is time the matter became one of public concern.

OLIVE OIL is now used in many ways at one time never thought of. Besides being more largely used medicinally, it enters into various processes of cooking much more extensively than it did. It is well known that eggs fried in good olive oil are much better flavored than when any kind of fat has been used. In massage, bathing, and for numerous other purposes, the use of this most natural valuable food is greatly extending. The value of good olive oil is beginning to be much more generally recognized throughout the world than it formerly was. Eminent authorities have experimented with it and found it a potent agent for any defects of the excretory ducts, especially the skin. Eczema has rapidly disappeared upon a discontinuance of starch foods and a substitution of a diet of fresh and dried fruits, milk, eggs and olive oil. Its beneficial effects when taken in conjunction with a fruit diet have frequently been remarked upon the hair, nails and scalp, quickly clearing the latter of scurf and supplying to the sebaceous glands the oily substance which they secrete when in a healthy condition, and the absence of which is the cause of debility of the hair, frequently ending in baldness. It has long been observed that those who look upon olive oil as a common article of food, and take it as such, are generally healthier and in better condition than those who do not. Its therapeutic and prophylactic properties are now well know to medical men. Oil is destructive to certain forms of micro-organic life, and it is reasonable to suppose that they can best be eradicated from the system by its internal use. The use of oil not only does this, but it restores to the worn-out or diseased tissue just those elements of repair that its reconstruction demands.

CHIEF ELECTRICIAN HEFT of the New York and Hartford Railroad ran an electric car at the rate of 80 miles an hour over a tangent between Nantasket Beach and Hull, Mass., last Saturday.

Mining Summary.

CALIFORNIA.

Amador.

The Amador Queen No. 2 has been bonded by E. H. Gould for $25,000 from Dr. Bardue. Sixteen men have been put to work in enlarging the mill in Hunt's gulch.

Butte.

The Big Bend mine is to be again worked under the foremanship of H. Turner. The water will be run through the two-mile tunnel, and it is expected that twelve miles of the bed of the Feather river will be laid bare.

Considerable work is being done at the Golden Feather. A twenty-ton iron boom and derrick was put in place this week.

Mercury: George H. Evans of the Banner, and other syndicate mines in the vicinity has assumed the management of the Wilson mine on the Magalia ridge, and will use the machinery of the Butterfly mine for working the Wilson. The Magalia ridge will soon be tunneled into as effectively as was the bluff in Oroville in '56, with prospects of good pay.

At the Magalia mine the water in the old works has been pumped out and the mine is now ready for working. In approaching the old works from the new shaft, drills with 10-foot shafts were used, and, when the water was struck, the wall of solid rock between the old and new works was sufficient to hold it in check, except as it escaped through the drill holes. This caution was necessary in order to prevent accident from flooding the new works. The channel can now be reached from the old incline tunnel, or from the shaft just completed, and, with the aid of proper machinery, can be successfully worked.

Calaveras.

D. R. Prince is in this city negotiating the sale to Englishmen of the Prince group of mines.

San Andreas *Prospect*: Machinery has been ordered for the Esmeralda mine. Preparations are being made to open up the Grace mine near El Dorado. The Marshall mine has begun active operations. The mill at the Donnellan mine is kept busy crushing on good rock. Thirty men are employed at the Martin gravel mine, near Sheep Ranch. Prospect work on the Shenandoah mine is being vigorously carried on. A five-stamp mill will soon be erected on the Cape Horn mine, near Copperopolis. The shaft on the Dora mine in Pine Log district is down 90 feet. The 10-stamp mill on the Rose Hill mine is kept going night and day. The contract for erecting a mill on the Fellowcraft mine has been awarded to M. Hertzig. The Schrack and Tada mine at Golden Gate is being worked by a double shift. Wise and Bunting have sold the Big Chief mine on Murray creek, above El Dorado. The new proprietors have let a contract for running a 200-foot tunnel. The Gwin mine shaft is down 1270 feet, and in a slate formation. The back wall for the mill has been built and grading for the site is now under way. Several loads of heavy mining machinery were hauled to the Fellowcraft mine this week, to be used in connection with the mill. The ten-stamp mill on the Leonard mine is to be torn down and taken over to the Fellowcraft where it will be put up. As soon as the mill is in running order crushing will commence. Drills will be worked in the mine and a dynamo erected. The shaft is to be sunk 700 feet.

Prince Poniatowski has been given a bond on a portion of the Gobbi ranch, two miles west of San Andreas, for two years for $24,000. One-half is to be paid in a year, one-half at the end of two years. The first installment of $1,000 was paid upon the signing of the bond.

El Dorado.

(Special Correspondence). — From Placerville to Grizzly Flat, twenty-six miles to the east, and from the same place through Kelsey for sixteen miles across the Georgetown Divide, a great deal of prospecting is in progress with a view to extensive development work. To the south and west of town considerable capital is at work in systematic delving for depth on the mother lode, and satisfactory results are becoming manifest.

The tunnel on the Vulture mine, owned by Dench & Craddock, one mile north of town, has reached 150 feet. It is on a 3-foot porphyry quartz ledge and a very good grade of ore.

The Gentle Annie mine is shipping 400 tons of sulphurets to the Selby smelting works.

C. E. Hayes and a party of San Francisco people bought a claim within half a mile of Greenwood. They have run 160 feet of tunnel and expect within another 100 feet to strike the lead.

The old Cedarburg mine, three miles northeast of Greenwood, which is said to have produced over $500,000 some twenty years ago, is being reopened. The old shaft has been cleaned and timbered to a depth of 318 feet. The bonders are preparing to place a steam engine and hoist.

There are about 200 stamps dropping steadily in this county and about 180 projected on new properties, to be erected this season.

Placerville, Cal., June 29, 1896.

Inyo.

At Mammoth Palmer & Judd have a 10-stamp mill running on ore from the old Mammoth tunnel. Wm Couch is superintendent.

Kern.

The following is from a private letter written by a mining engineer whose experience and reputation justify attention. Speaking of Randsburg, which he has just visited, he says: "The camp has the finest showing on the surface that I have seen in many a day, and if the ledges hold out in depth it is certain to become a very important mining district. It is free gold of high grade, running from $25 to $150 per ton. The deepest mine I saw was down 69 feet and still sinking; the incline does not show any footwall and the width of the ledge is undetermined. There are about fifteen or twenty very promising locations that are being developed. There is no wood or water at the mines. The water has to be hauled about twelve miles from Cow Wells and sells at $2 per barrel. If the district developes as well as it now promises to, they will probably secure power to pump water up from the valley and to drive the mills by electrically transmitting energy from Kern river, about fifty miles distant. I think the district is located on Section 35, T. 30 S., R. 40 E., and is about twelve or fifteen miles from Goler and Red Rock, where the placer mines are."

O. B. Stanton has bonded the Blue Chief mine on Greenhorn mountain, forty-five miles northeast of Bakersfield. It has a ledge five feet wide, assaying in gold and silver.

Advices from Randsburg report another strike in the Yucca mine, a mile and a half south of the Olympia group. The ore is said to run $400 per ton.

The owners of the Olympus mine at Randsburg will erect a 20-stamp mill thereon.

Mariposa.

(Special Correspondence).—As the Merced Gold Mining Company's call for $2 per share, or $200,000, can only be used for development work, it is to be presumed that the directors have made up their minds to carry out the original plan of putting up 100 head of stamps and bringing in electrical power from the waters of the Tuolumne river.

The bond on the Virginia mine now owned by Professor Clarence King and Paul Blackmar expires on the 14th of July. These gentlemen have done work on the property to the tune of about $8,000 without getting into the end of the old workings, and have suspended operations. It is stated on the best of authority that Messrs. King and Blackmar will pay what is necessary on the bond on or before the 14th prox., and that thereafter they will take their own time about further development.

The Coward shaft at the American mine is to be sunk several hundred feet, and a drift will be run in to meet it. The shaft is now down about 50 feet on a 4-foot ledge that shows free gold and prospects well. It is just below the water level and the character of the ore seems to be changing from loose sugary quartz to very heavily sulphureted rock. New pumps and hoisting plant have just been put in position.

The Tyro mine keeps its 10 head of stamps going night and day.

At the Louisiana, under A. C. Cable, superintendent, development work is going on steadily.

There is nothing positive to report about the Mariposa Grant. From information received on the ground it appears that John D. Ludwig is on his way back from the East. It is stated that the Messrs. Jones (Sam and Senator John P.), have made an arrangement with the other parties interested to look after the affairs of the grant for some time to come, and that Mr. Ludwig returns fully empowered on their behalf to set matters going.

At Red Banks, eight miles southeast on the Merced, the owners are watching the river. When it gets to fall level a dam will be put in and work started on a big scale. At least 100 men will be employed. The air in the tunnels is now so bad that work is next to impossible.

Coulterville, July 1st, '96.

Nevada.

Five stamps are to be added to the number in operation at the Brunswick mill.

At the Red Hill mine Superintendent Treadwell tells the *Union* the first cleanup amounted to more than he expected. He has cabled to the company in London that they may expect a handsome dividend from the start.

Placer.

The Morning Star mine of Iowa Hill has declared dividend No. 67 of $7 per share.

Plumas.

At Gibsonville Judge and Clough have let a contract for 100 feet of tunnel in the Union mine to demonstrate peradventure the presence of the "back channel in the Gibsonville ridge.

San Diego.

At Hedges the mill of the Golden Cross Company in charge of Receiver Stewart, E. W. Mellarkey and G. W. Bothwell is running to its full capacity.

The Queen mine which was closed up on account of fire in the timbers is again furnishing ore. A new pump is unwatering the mine.

The incline shaft of the Cross mine is down to the 300-foot level from which ore is being taken out.

The Crown mine is turning out 100 cars daily of $6.50 to $7 ore. The mill is crushing 350 tons per day.

Yuma *Sentinel:* The Golden Dream group has been secured by New Jersey men, who will crosscut the two veins in two places on each and also sink a shaft 50 feet in depth on each, and crosscut the veins at the bottom, in order to test the ores in each vein. They will erect a mill on the bank of the river one-fourth of a mile distant from the mines early in the fall.

The cut and tunnel have been run across Alcyon vein 31 feet reaching a depth of 24 feet from the surface at the end of the tunnel, where a pay streak of very rich ore was found showing a large amount of free gold, visible to the naked eye. The white quartz underlying the rich pay streak on the foot wall is also rich in free gold. The vein 2000 feet south of the tunnel is not as wide but much richer in gold, while 3000 feet farther south the vein is wider, prospecting good $5 ore. Taken as a whole, in 415 tests made of the ore all but thirty showed well in free gold with an average of from $7 to $15 per ton in gold.

Out of 460 tests made for 1400 feet in length on the Oro Blanco mine, which joins the Alcyon, all but 20 made a good showing in free gold, averaging from $5 to $7 per ton. The vein is from 20 to 100 feet in width, all of which carries good paying free-milling ore. The vein is cut nearly its whole length by an arroyo from 20 to 100 feet in depth. Cross arroyos expose large bodies of $5 ore.

S. E. Shankland and his associates, Brown and Graham, are opening a large vein of free-milling ore near Gariso gulch, four miles from the Colorado river, that is 107 feet wide.

Shasta.

(Special Correspondence).—At the Mountain Mines Ltd. Co., Keswick, the rolling stock of the railway is of the English pattern and wholly unsuited to the traffic. The development work on the mine has been diligent. The tunnels now pierce the big copper ore body from all sides. This body is oval in shape. The workings show one million eight hundred thousand tons of copper ore blocked out and ready to mine, and over two million tons of iron ore high in gold and silver.

Free Press: On Monday thirty men were put to work at the switchback on the Iron Mountain Railway above Keswick. They are grading a site for a large roasting plant. The ore from the mines at Iron Mountain contains a great deal of sulphur, which in smelting forms into clinkers and seriously interferes with the operating of the smelter. It is now proposed to haul the ore by rail from the mines to the roasters, where it will be dumped by automatic dumping cars into bins, from whence it is carried by chutes to the roasters. The roasting process will eradicate the sulphur from the ore, which will then be run off in chutes to the cars on the lower switch and conveyed to the smelters.

Siskiyou.

Journal: At the Barkhouse mines of Billups, Quigley & Humphrey the ore is still crushed in their twin arrastra, and at every cleanup they bring in a good-sized brick.

The Gold Ball mines on Sawyer's Bar have been paying well this year.

The Seattle Placer Mining Co., on Thompson creek, has completed a new ditch six and one-half miles long.

The Distlehorst & Barton Klamath River Dredging Co. will commence hoisting about the 20th of July. The promoters of this enterprise are busy getting everything ready, and are satisfied the dredger will prove as successful in the Klamath as it has in other streams.

McCook, Raynes & Co, who have a claim on the extension of the Siskiyou quartz ledge at Humbug, tested two tons of the quartz at McCook's mill last Monday, which realized $40 to the ton free gold, with considerable more not saved on account of the quartz being full of sulphurets. They intend sending a sample below for assay, in order to ascertain the real value of the quartz. The quartz is very heavy and undoubtedly rich in gold, although not visible to the naked eye.

The American Bar mine at the mouth of Ash creek, Klamath river, is now being worked energetically with good success.

The Fraser mine, near Happy Camp, owned by the Siskiyou Mining Co., was attached this week by Deputy Sheriff Radford.

At the Bunker Hill mine, Klamath river, near Happy Camp, the ditch they have been building is completed.

Trinity.

Journal: Operations have begun on the Lappin mines in Deadwood, owned by Cochran, Brady & Tourtellotte.

McLean Bros. of Redding have a contract to complete the Rush Creek-Stuart's Fork tunnel. About 1100 feet of the tunnel is completed and they will finish the remaining 9000 feet. They expect to complete it early in 1897. The original survey showed that about three miles of flume could be constructed and used to advantage, but on account of the high price of iron it is now proposed to considerably increase the length of the flume, reducing the quantity of pipe required.

Tuolumne.

The *Independent* is informed that the Mustang mine near Confidence is now under bond to Hugh Callahan, who will put on more men and extend developments.

From south of Sonora, and toward Jamestown protests have been filed at the local Land Office against the State selections of lands, some of these selections are supposed to be agricultural lands. That region is considered mineral land, though in the years of surface mining Chinese worked over the ground, and it was turned into pasture for cattle and sheep. To obtain title to these lands applications were made to the State for selections as agricultural lands in lieu of the sixteenth and thirty-second sections for school lands. There are over twenty protests filed by those who claim that the land is still mineral, and who have filed mining claims on the same. The trials will be held this month and next.

The Mazeppa mine, adjacent to the Juniper, has been sold to New York men, who will sink a vertical shaft. The Juniper's new mill is about ready for use. The new chlorination works at the Rawhide are in process of construction. At the App connection has been made between the shaft from the surface and the upraise from the 800-foot level.

Yuba.

(Special Correspondence). — Camptonville mining district is situated fifty miles northeast of Marysville. The Honeycomb Mining Co.'s property is one mile northeast of Camptonville. W. B. Meek is superintendent. This mine is soon to be in operation. The ore body runs northeast and southwest, stands nearly vertical, pitching slightly to the east. The hanging wall is slate and the footwall granite, from 12 to 14 inches thick. A shaft has been sunk 90 feet, but the present development is being done through a tunnel, now in 245 feet, which will be, when completed, 305 feet long and will tap the ledge 150 feet below the croppings. At this point an upraise will be made; and if the ore body holds its own, as developed in their shaft, a mill will be erected this fall. Twenty mill tests from ore taken from the shaft while sinking, I am credibly informed, paid an average of $25 per ton, and they have about 100 tons of such ore now on their dump. The ore is free milling, with no sulphurets.

Brown's Valley, in and around which place is situated the Brown's Valley mining district, is twelve miles northeast of Marysville. It contains about 300 inhabitants, one-third of whom are living in tents. Two-thirds of the present population have been added within the past six months, owing to the impetus given to prospective mining. Three new companies have started up within the time mentioned. A town site has been laid out, surveyed and eight lots sold by a Marysville syndicate. Buildings are being contracted for, and several will be erected in the near future. The principal mines are the Webb Gold Mining Co., located within the town of Brown's Valley, consisting of three corporations—the Dannebrog, the Pennsylvania and Jefferson G. M. Co.—combined in one corporation under the above corporate title. J. C. Campbell is superintendent. This company owns the Pennsylvania and has the other two under bond. In addition, they own the following claims: The Hawkeye, Blowsnake, Northern Light and F. W. P. Their improvements consist of a 20 stamp mill (built for 40 stamps) nearing completion—in fact, it will be in operation by the time this appears in print. The Dannebrog and Pennsylvania properties are covered by U. S. patents. This company's plant and mines cover an area of 4900 feet in length by 1000 feet in width. The ore body runs north and south and pitches east on an angle of from 45° to 48°. The ledge runs from 12 inches to 8 feet thick between walls of porphyry and greenstone, the latter constituting the footwall. The principal development is at present confined to the Dannebrog, upon which an incline shaft is now down 550 feet, following the trend of the vein. They are running five power drills with their air compressor. Thirty-five men are employed, but in a few days, or as soon as the mill is set in motion, this number will be increased to forty-five. A shaft has previously been sunk on the Pennsylvania on the incline of the vein to a depth of 800 feet, and a similar shaft on the Jefferson to about the same depth. These shafts are full of water. It is the intention of this company to unwater and thoroughly prospect the lower levels of each. They are extracting about thirty tons of ore daily from the Dannebrog, which the superintendent informs me will mill $10 per ton. It carries about 2% high-grade sulphurets.

The Faust mine, formerly known as the Hibbert & Burris, adjoins the Dannebrog on the northwest. It has been bonded to a San Francisco syndicate for $15,000 by Hibbert & Burris. A. H. Walrath of Nevada City is the superintendent. Under his management the company is sinking a shaft, now down 200 feet. This mine is of the usual length, 1500 feet. It runs northwest and southeast and pitches northeast, with a ledge about two feet thick, confined between walls of porphyry and greenstone, similar to those of the Dannebrog. A drift has been run in from the 120 foot level 380 feet. Their improvements consist of a fine hoist and a 5-stamp prospecting mill, run by steam power. They are mining and milling about ten tons of ore per day that I am informed pays them about $20 per ton. A mill test of 100 tons did pay $20 per ton. They are at present working twelve men.

The Old Flag mine, located half a mile north of Brown's Valley, is a corporation, of which S. Blight is superintendent. The ore body of this mine runs north and south and pitches west at an angle of about 45° and runs from three inches to three feet in width, between a hanging wall of slate-mixed porphyry and a footwall of greenstone. Their improvements consist of a hoist and pumping plant run by steam. This mine is being developed through a shaft now down 300 feet. Several drifts have been run at the 100, 200 and 300 foot levels aggregating 200 feet in length. The ore is free milling, and from a mill test of 400 tons of rock from this mine it paid about $16 per ton. The superintendent informs me that a mill will shortly be erected upon this property.

Smartsville, eighteen miles east of Marysville, contains about 400 inhabitants. At one time in the early days of hydraulic mining it supported a population of over 2000 people. Its great banks of still untouched pay gravel, the perfect condition of its great water canal and the staying qualities and patience of its people indicate that some time the mines in and around Smartsville will again be productive.

The Excelsior Water and Mining Company is a corporation, the principal office of which is located at Smartsville. W. G. Halstead is president and treasurer and Joseph Dunfee is secretary. The principal properties of this company are located on the south side of the Yuba river. They are varied in character, and consist mainly of placer mines, a water system, ranches and orchards. Of mines and mining ground this corporation owns about two and one-half miles in length of the Pliocene Yuba channel, a gravel deposit varying from 200 to 700 yards in width and about 400 feet in length. About one and one-half miles of this company's possessions have been worked out, which yielded some $12,000,000. One portion of this deposit embracing only 800 feet of the channel yielded over $1,000,000 in net profits. Their minimum supply of water will aggregate 3000 miners' inches through the driest season, which is supposed to be an abundance for irrigating 15,000 acres of land. This company have also under their control reservoir sites that will nearly double their capacity when brought into requisition.

Timbuctoo, now nearly depopulated, is one mile west of Smartsville. It is now a part of the Smartsville or Empire mining district.

The Mark Antony quartz mine (a corpora-

tion), located three-fourths of a mile nearly south of Timbuctoo, which has been idle for over fifteen years, is again about to spring into activity. This company's claim consists of 5000 feet of a lode or ore body, with 300 feet on each side, located previous to 1872. It runs 20° west of due north and 20° east of due south and dips to the west on an angle of 12° between walls of hard slate. Their improvements consist of a 10-stamp mill, nearly complete in all particulars, but only primitive hoisting machinery. The developments consist of an incline shaft sunk near the center of the claim on the trend of the vein to a depth of 175 feet, exposing an ore body 5½ feet thick. At a depth of 100 feet a tunnel has been run in on the vein to drain the shaft. A new shaft is being sunk on the ledge about forty feet southeast of the mill, which is located at the mouth of the tunnel, now down about 60 feet.

The Beehive mine, four miles northeast of Forbestown, but in Yuba county, has just been taken hold of by a Chicago syndicate, under the superintendency of Oliver Roberts, formerly of the Pine Nut district, Nevada. They have a shaft down 170 feet, exposing an ore body three feet thick, a tunnel in 200 feet and an 8-stamp mill, all of which are undergoing repairs.

The Steele gravel mine, located in Yuba county, one and one-half miles south of Forbestown, in Butte county, is owned and managed by T. H. Steele. This property consists of 320 acres of an ancient river bed located on the north bank of New York Flat creek. It is worked by the elevator hydraulic process. Twelve men are employed running two giants night and day. Restraining dams hold the debris in conformance with the Caminetti act. This mine cleans up but once a year. It is reported that last year's cleanup aggregated some $42,000. My next letters will follow from Butte and Plumas counties.

L. P. Mc.

NEVADA.

ESMERALDA COUNTY.

The Pamlico Mining Company, near Hawthorne, have milled 6300 pounds of ore. Mint returns show a value of $435 50 per ton and the gold value of the bullion $17.42 per ounce.

HUMBOLDT COUNTY.

Deegan and Denio in Pueblo district, a month ago started up a 1-stamp mill, with a capacity of about one ton a day. In that time it has produced gold bullion valued $1850, from twenty-three tons of ore.

OREGON.

JOSEPHINE COUNTY.

A mill test of twenty tons of ore from the Clint & Jones mine, in Mt. Reuben district, yielded an average of $48 to the ton.

Schieffelin & Co.'s mill at Bunkum, in Foot's creek district, is doing considerable custom work.

Miller & Davidson of Missouri Flat brought $800 worth of gold dust to Grant's Pass last week.

Geo. B. Dornin is operating the Jewett mill and mine, near Grant's Pass.

The Panther Creek Mining Co., operating on Oak Flat, in lower Illinois river district, have placed an additional giant in position.

The annual cleanup at the Hampton mine, Grave creek, shows nearly $100,000 gold from 3 of the 100 acres of ground owned by the company. Last year a $50,000 ditch was built, and the year previous another costing a large sum, and for two of the claims $40,000 was paid. On the average, sixteen men are employed, night and day shifts, who are paid $2 per day without board.

LANE COUNTY.

At the Bohemia mine there are 150 men on the payroll.

UNION COUNTY.

The 20-stamp mill of the Union and Companion mine, Cornucopia district, has started up.

WASHINGTON.

The Leavenworth *Times* reports the sale of the North Pole group of mines, on Nigger creek, to Seattle men for $50,000, $3000 down and $5000 August 12th.

BRITISH COLUMBIA.

Talking of Trail creek to a Seattle reporter C. C. Woodhouse says the geological formation of Rossland is hornblendic diorite; the veins cut through it easterly and westerly, with positive strength. The ore is prehotite and chalcopyrite, iron mono-sulphide and copper desulphide in a quartzose matryx, with a mixture now and then of calcite. In just what chemical condition the gold exists is a question among chemists. It is invisible before roasting, and visible after roasting and panning the prepared ore. Being a non-desulphide, the ore is easily desuphurized by washing preparatory to smelting. Much of the ore contains a large excess of iron, making it a very desirable ore for smelting.

The deepest shaft in Rossland is 500 feet. The veins are so strong and continuous along the surface that mining engineers are willing to make preparations at once to work the mines on a systematic plan, by putting down double-compartment working shafts, with hoisting machinery, even before prospect work has been done. There are several such plants now being installed. There is also much preparation being made for diamond core drilling on the veins.

The Columbia & Western railway has lately been constructed from the Heinze smelter at Trail, on the Columbia river, to Rossland, westerly seven miles. D. C. Corbin's Red Mountain railway from Northport, on the Nelson & Fort Shepherd railway to Rossland, a distance of sixteen miles, is under construction.

The Canadian Pacific has surveyed a line from Robson on the Columbia river, south thirty miles to Trail, and the Columbia & Western will build from Trail to Sayward, on the Nelson & Fort Shepherd, with three rails, a distance of six miles, which will connect the Canadian Pacific system with the American system of railways.

The ore generally is too low grade to admit of long transportation, and should be locally treated.

J. C. Ryan, manager Antoine and Eureka mines, furnishes the Kalso *Kootonian* the following figures, showing the net earnings of sixteen Slocan mines during the first six months of 1896. The gross earnings are placed at $1,500,000. The net earnings he places at $515,500 as follows: Slocan Star, $100,000; Ruth, $25,000; Reco, $30,000; Goodenough, $20,000; Whitewater, $40,000; Wellington, $40,000; Last Chance, $25,000; Monitor, $20,000; Idaho Group, $125,000; Northern Belle, $20,000; Payne Group, $20,000; Slocan Boy, $4,000; R. E. Lee, $10,000; American Boy, $4,500; Antoine, $12,000; Deadman, $20,000. Total, $515,500.

ALASKA.

William Hutchinson, from Cook's Inlet, Alaska, where he spent two months, says there are 1750 people on Six-Mile creek and about as many on Resurrection creek. About 750 of them are making from $2 to $15 per day at placer mining, but the balance, he says, are absolutely helpless and unable to find enough to keep them alive. Some of the prospectors, many of them old miners, would like to go to the Yukon country. That, however, is 200 miles away and it is currently reported that the Copper river Indians, who live between, are on the warpath.

IDAHO.

The Idaho *World* asserts that the aggregate gold output of the placer mines of Boise county is $300,000,000.

At Juliaetta it is believed that the high-water mark in the Clearwater has been reached for this season, as the water has been receding. This proves that the heavy fall of snow in the Bitter Root mountains has been nearly all exhausted.

A stream of miners and prospectors is making its way into the mountains, especially to the old camp of Florence, as several strikes have been made, while other and more developed claims have been sold.

Four quartz mills have been erected this summer. The largest one, of 150 tons, will be erected on the Ozark, two miles from Florence.

At Burke the water is pumped out of the old workings of the Hecla and sinking begun.

At Gem the Gem mill and mine employs sixty men. The work is largely development.

The Frisco is running with a full force, crushing 500 tons a day.

At Florence a company has been formed with a capital of $250,000 to build a first-class custom stamp mill.

MONTANA.

The Colorado Smelting and Mining Company brought suit last week against the Original Butte Mining Company for $95,748 84; levy was made on defendant's mines, west of Gagnon, near Butte.

The annual report of the Iron Mountain Mining Co. of Missoula shows the mine and mill paid in dividends $85,000. There were mined during the year 66,856 tons of crude ore, which produced 5767 tons of concentrates. These concentrates were loaded into 265 cars for shipment and produced net returns of $326,378.43, or an average of $1231.62 per car. From these shipments there were 497,889 ounces silver, value $333,586 23; 4,466,103 pounds lead, value $138,332.44—a total of $472,-008.67. The freight and treatment cost $145,630.24; net returns, $326,378.43. The current expenses for the year were $203,318.57, leaving a profit of $123,059.86.

The largest blocks of copper ever shipped from the Rocky mountain region are now being cast by the Anaconda Company for shipment to St. Petersburg, Russia, says the *Recorder*. They average in weight 3600 pounds and measure 6 3-16 inches thick by 42 inches square. The company has an order for 200 long tons to be used for armor plate in lining battleships of the Russian navy. After it arrives in Russia it will be rolled out into sheets.

WYOMING.

At Green River the owners of the soda well are pumping the product into evaporating vats. The capacity is 2500 pounds of soda every ten hours, the commercial value being $50. It is estimated that, with sufficient vat capacity, the plant will pay a profit of $75 a day.

COLORADO.

W. F. Kendrick says: "When I commenced mining here in 1874 I went to the mines in a stage coach or in my own conveyance; smelting and freight rates were high and nothing but the mines with rich ore could be worked, as illustration: In the Alma, Leadville, Gunnison and San Juan districts it did not pay to ship out ore carrying less than $100 per ton; at Alma the freight charges to the smelting works were $20: smelting charges, $30 to $35; discount for loss, 20 per cent, or $20 on $100 ore; sampling charges, $5; so that $100 ore sold at $25; at the present time $100 ore at the same place is paid for as follows: Freight charges, $5; smelting charges, $7; discount for loss, 5 per cent, or $5; no sampling charges: making in all $17; so that $100 ore is worth today $83, as compared with $25 twenty-two years ago. Now the freight is regulated according to value. On ore carrying $12 per ton the freight to Denver is $1 per ton; on $20 ore, $2; on $35 ore, $3, and above that $5 per ton, and the smelting charges are regulated, according to character, from $1 to $10 per ton; as illustration: a pile of low-grade material, carrying $7.45 per ton, was thrown away at Alma as worthless two years ago; this was shipped to Denver recently and sold at a profit as follows: freight charges, $1; smelting charges, $3; discount, 5 per cent, or 35 cents, making $4.35, and leaving $3.10 per ton net on the $7.45 ore."

Silverton is enjoying an advantage in the facilities of treating ores, as well as in freight rates. There is a shortage of ores below the capacity of the Durango and local smelters, and this is giving as low as a $5 charge for smelting. The Silverton matte smelter is kept running on the sulphide ores of the Genessee Vanderbilt, Guston, National Belle and Hudson at Red mountain and treating the dry ores of Maggie gulch. It handles 140 tons a day and is short on the particular class of ores it demands. Nearly all the ores of the district carry more lead than the miners can afford to lose on this process. The lead concentrates from the mills of the district are shipped to Denver, Durango and Pueblo smelters, the freight rate to Durango being $2 a ton, against a $7 charge to the other points. The Crooke mill extracts the values by a modified chlorination process, but handles a class of custom ores that is not produced in any considerable quantity in the district, though it is kept running on less desirable ores from the North Star or Solomon, owned by the proprietor of the mill. This situation, while not expected to continue throughout the season, makes a particularly advantageous market for the miner.

At Durango, on the 25th ult., while blowing out furnaces of the Standard smelter, previous to closing it down for a while, a matte fell in a well, causing it to explode on one of the furnaces. The building caught fire and was destroyed. Loss $20,000, partially insured.

The State Land Board and the State Engineer have prepared the following rules which will govern the subdivision of State lands into mineral lots:

The engineer shall first make an accurate survey of the boundary of the section to be lotted, taking vernier angles and measuring with a steel tape each side, to locate all the section and quarter section corners.

In case any of the Government section or quarter section corners are missing, the proper survey shall be made to re-establish them according to law, and the rules of the United States general land office.

A corner so re-established shall be marked by a large stone firmly set and properly marked with a chisel.

All the lot lines shall run parallel with the south and east boundary lines of the section, whether it makes the lots perfectly square or not, and whether said boundary lines are straight from one section corner to another, or describe an angle at the quarter section corner.

Wooden monuments at least five inches square and three and one-half feet long, well set two feet into the ground, with a nail in the top to mark the exact corner, are to be placed at all the lot corners, except at the section corners.

The monuments to set diagonally, with the corners on the line of the lots, and on each side is to be inscribed the lot number towards which it faces, in figures at least two and one-half inches long, which are to be painted with a durable black mineral paint.

In case the lot corners occur on an inaccessible point, where it is impossible to set a monument, a witness corner is to be set on the lot line, as near the true corner as possible, and properly marked to denote its position relative to the true corner.

At least four of the lot corners on each line across the section shall be witnessed by trees or other natural objects, properly marked, and the field notes shall show their position in relation to the lot corner.

In case a portion of the section is not owned by the State, or it is not considered desirable to lay it out into lots, the necessary corners to establish the boundary between the lotted and the reserved portions shall be set, and the division of the State land shall proceed in the same manner as when the entire section is to be lotted, by starting at the southeast corner of the section and measuring the full lot distances both west and north.

The lots bordering the reserved portions to be fractional the same as on the west and north sides of the section.

The map shall be platted on tracing vellum, 16x20 inches, at a scale of 400 feet to one inch, showing accurately, both as to angles and measurements, the section boundaries, and all the lot lines with the acreage of each lot.

The field notes shall be made on sheets the same size as the map, and bound to it, and shall show in detail the full notes taken on the survey, including the surveys to establish the missing corners (both section corners and quarter-section corners), the survey of the boundary of the section, and the latitude and departure notes to check the same, the order in which the lot lines were run, and all the other notes taken, followed by a certificate of the engineer making the survey as to its accuracy.

NEW MEXICO.

At Pinos Altos the Mammoth mine and 10-stamp mill are running steadily, shipping a gold brick every week from eight to thirteen pounds in weight. The concentrates saved produce about 50 per cent of the value of the gold saved on the plates.

ARIZONA.

W. D. Luce is erecting a cyanide plant at El Rio, near Yuma.

The *Republican* reports that the Silver King mine is again being worked and has a larger ore body than ever in sight.

The Commercial Mining Company's smelter at Big Bug is reported to be making one of the most successful runs in its history and has already turned out 60,000 pounds of matte.

The Pima Mining and Smelting Company of Arizona says it has 10,000 tons of copper ore in sight averaging 12 per cent in copper, with traces of gold and silver.

Kingman *Miner:* Mr. Pope, of San Bernardino, has just finished a survey of a line for eighteen miles of pipe. It is proposed to carry the water of Iron Springs by gravity to Gold Basin, where it will be used for milling purposes. The water of Grass Springs has also been secured, and if necessary will be piped to the mines. A 60-stamp mill will be put up on the mines and two hundred tons of ore per day will be milled.

AUSTRALASIA.

WEST AUSTRALIA.

(Special Correspondence.) After a long and tiresome journey, I have arrived here at last. I have been here two weeks, but have not got settled down to much of anything yet. First and foremost, I can assure you that this country is not by far what it is represented to be. I have no doubt but what there are a few good mines on the field, but most of the so-called rich mines exist in the imagination of a lot of mining speculators. The way some of those people boom the country is a shame. They not only ruin the field, but are the direct cause of misery and hardship. They will start a sensational report about some rich discoveries about a hundred miles or so in the interior of the country, when there will be a rush of hundreds of people for the place, and neither food nor water can be had at any price.

I have traveled nearly 500 miles in stages since I arrived at Coolgardie and have seen several graves on the road, where some poor unfortunate is taking his last sleep.

Typhoid fever is prevalent here to an alarming degree. At present all hospitals on the field are full of fever patients; but the cold weather will soon set in, when it will be somewhat better for a few months.

This country is the most trying on a man that I have ever been in. Nothing in the way of fresh provision; everything is canned goods. All water must first be condensed before it can be used for any purpose. The price of water varies from 10 cents to 25 cents per gallon, according to localities.

Board and room in this place is £3 3s, or about $15.75 per week, and poor board at that. So you can see how essential it is for a man to receive a good salary.

Freight from the end of the railroad to this place is £40, or about $200, per ton; distance, 140 miles. A 2-pound can of California fruit is from 80 to 90 cents; flour, £65 to £75 per ton, or about $350; horse feed, from 16 to 20 cents per pound; a quart bottle of beer is 4s, or $1, and everything else sells at outrageous prices.

Miners' wages are out of all proportion to the prices of living in and around Coolgardie. Miners get £3 10s per week and drinking water; at this place. £3 15s, and £4 per week and water, or about $20 in American money at the most. The majority of the miners are boarding themselves the best way they can, so as to save enough money to take them out of the country again.

Thousands of men are coming into this colony every month, and no work for a large per cent of them, as the mining companies can not get supplies or machinery on to the field. When I left Freemantle three weeks ago there were then 30,000 tons of freight lying scattered around for transportation to the mines, and thousands of tons have arrived there since then, with no immediate prospect of even a slight chance for months to come to raise the blockade.

The West Australian Government has got everything in the country in a fearful muddle, as nearly every branch of industry is under Government control. To even begin to describe the state the country is in, or will be, is almost impossible. The company that employs me has mines, or rather holes in the ground, in different districts. I have visited several of them since I came here, and I can truthfully say I have not seen a single good one in the lot.

I have just got back here from a trip to one of the company's claims, where the general manager sent me to report upon. I have sampled the ore thoroughly all over the mine and on the surface. The best assay was 10s per ton, at a depth of 90 feet—the bottom of shaft. The assay in one place was 15 grains and in the other a trace of gold. You can judge what sort of property that is to erect a mill upon, and that particular claim is one of the gilt-edged ones of my company.

The mine I was sent out here to manage was abandoned twice by the original owners before it was floated on the London market. I have been informed that £1,500 was paid for it to the last owners, and along with a few other prospects it was floated on the London market for £250,000, or $1,250,000, with £70,000 working capital. The men who floated the mine still retain the largest portion; but, from all appearances, they are trying to get rid of their holdings before any milling is done.

The general sentiment and feeling of the people is that the only salvation for this overrated field is to keep mills away from here as long as possible. Once the mills are erected and running for a month or so, you will surely hear of the most gigantic mining swindle ever perpetrated upon a confiding public.

Do not pay any attention to any newspaper talk or so-called mining experts' reports, as they are in most every instance made for the purpose of booming the stock market in London.

It is very amusing to read some of the reports of these mines made by so-called experts, when in fact lots of them have never done a single day's work either in a mine or a mill and could not tell a piece of gold-bearing quartz from a piece of country rock.

I do not think there is a single mine now in operation in West Australia that will pay the investors 1 per cent on their money. The principal trouble is that the mines are over-capitalized. Among others, I know of one claim which was floated on the London market a few months ago for £250,000, or about $1,250,-000. At the time it was foisted on the confiding public, I am informed, there was scarcely enough work done upon it to hold the ground according to law.

To give you an idea how this great mining swindle is accomplished: There is a mine, called the Great Boulder, four miles from Kalgoobi. Parties will locate a claim some-

where within five or six miles of said mine, not even on the same ledge, and call it Boulder Extended, or Boulder something else. As long as they can get the name of Boulder in some way or other it will fool the English people, or, as they call the English investors here, "muggs."

If you ask a man who is well acquainted with the country whether he thinks the mines are or will come anywhere up to expectations, he will invariably say: "Make what you can while the boom is on. As long as we can keep mills out of the country we are all right." I must say that our manager is doing the best he can to keep things going on a slow basis. There are no mills crushing ore yet in this camp. I understand, though, that one company is going to make a trial of their mill within a week or two. Said property is considered one of the best in the district, if not the best. So everybody is anxiously waiting to know the results.

I expect to see some glowing reports upon it. It matters little whether they are true or not. My advice is for Americans to stay at home by all means.

* * * * * * *

West Menzies, Australia, March 14, '96.

Personal.

G. McM. Ross has returned from Arizona.

Col. Geo. Stone has returned from Cripple Creek.

Jas. H. Tibbitts, of Amador, has decided to remain in Johannesburg.

Supt. Root of 9 Fremont street, is back from a business trip to Los Angeles.

Walter McDermott succeeds Mr. Seymour as chief engineer of Fraser & Chalmers, Ltd.

Frank Davis, of the Ybarra G. M. Co., has returned from Lower Cal., and is in Alameda.

T. B. Dillon has resigned the superintendency of the French Creek mines, Siskiyou Co.

T. A. Rickard, Colorado's State Geologist, is examining some mines at Neihart, Montana.

Gen. Duffield, superintendent of the Coast Geodetic Survey, is expected in this city about the 1st prox.

The resignation of Cecil Rhodes as director of the British South Africa Company has finally been accepted.

A. M. Keller, formerly of the Parrott, Montana, smelting works, is now in charge of operations at the works of the Mountain Mines Co., Keswick, Shasta Co., Cal.

At the commencement exercises of the graduating class of '96 from the Stevens Institute of Technology, Hoboken, N. J., held June 19, 1896, the degree of Doctor of Engineering was conferred by the faculty and trustees of Stevens Institute upon Commodore George W. Melville, Engineer-in-Chief of the United States Navy, in appreciation of the excellent engineering work performed by Commodore Melville for his country and the advancement of the science of steam engineering, well illustrated in the world-wide famed "White Squadron." Only once before in the twenty-five years' history of the Stevens Institute has the degree of Doctor of Engineering been conferred, and then upon Professor R. H. Thurston of Rhode Island, who formerly occupied the Chair of Mechanical Engineering in Stevens Institute, and is now Director of Sibley College, Cornell University.

Commercial Paragraphs.

I. S. Van Winkle & Co. shipped two Kinkead quartz mills to the Dexter Gold Mining Company, Tuscorora, Nevada, this week, together with their Daniel Best crude-oil engine as the motive power.

The Consolidated Kansas City Smelting and Refining Company has contracted with the Bunker Hill and Sullivan Mining Company, Cœur d'Alenes, Idaho, for a portion of their product of concentrates.

Messrs. Faneuf & Moffitt, successors to the Perkins Pump and Engine Co., at 117 Main street, this city, are prepared to build pumps and engines on short notice, or do general repairing. They are experienced engineers and machinists.

Frazer & Chalmers recently constructed a 20-stamp mill in the mining district of North Carolina. This is an event of more than usual importance, as showing that even in that direction and in the mountains of Georgia, where primitive methods have been the rule for many years, the march of improvement in mining is making itself felt. The mines in the South were worked in a desultory fashion for nearly a century. The methods used in extracting the ore were, prior to the war, similar to those now in use in many parts of Mexico. The anastra was in general use and in many cases negroes were employed to pound up the quartz in mortars for the amalgamation. There were no mills, no pans and an amalgamation plant was never heard of. The dirt was put in sluice boxes and was taken up by the quicksilver in the riffles. All the work was done by hand. The ore was put in small sacks, which were carried to the surface by the laborers and dumped in a convenient place for the crushers. A good hand could crush about 500 pounds in a day, and even with the small cost of labor ore carrying less than $20 per ton could not be worked.

Recent California Mining Incorporations.

La Suerte Gold Mining Co., San Francisco: M. A. de Laveaga, R. Herold Jr., F. Hess, L. S. Rose, A. T. Vogelsang; capital stock $10,000,000, $5000 subscribed.

Mount Diablo Gold Mining Co, San Francisco; P. Deidesheimer, W. J. Sutherland, P. A. Finnegan, J. P. O'Brien, H. Zadig; capital stock $1,000,000, all of which has been subscribed by the above.

Coast Industrial Notes.

—San Diego city has decided to issue $1,500,000 bonds and own its own water works.

—The new cannery at Fresno is offering $12 per ton for apricots; the growers ask $18.

The McCloud River & Siskiyou Lumber and Railroad Co. have men at work grading.

—The *Daily Commercial News* celebrates its 21st birthday by a superbly illustrated annual review.

—The Southern Pacific Co. has cut freights to and from all points reached by the S. F. & S. J. V. Railway.

—It is confidently expected that one of the big battleships, for which bids are now asked, will be built on this coast.

—The Southern Pacific has made a rate of $15 per ton on ore from the White Cloud district, White Pine county, Nev., to Salt Lake.

—About $300,000 is now available for Government work at the Mare Island Navy Yard, and a large additional number of men will be employed.

—The first 150 tons of rock from the State crusher at Folsom, for macadamizing streets, was used in Stockton, where the rock is delivered at 45 cents per ton.

—A treasury warrant for $578,000 was drawn by the Government last Saturday in favor of the Union Iron Works of this city, the final payment on the battleship Oregon.

—D. M. Murphy of San Jose has acquired title to a vast tract of country at Durango, Mexico, and has a contract to deliver 200,000 railroad ties yearly at the city of Durango at 70 cents apiece.

—Last Tuesday in this city the Circuit Court of Appeals defined the boundaries of Bering sea, and decided that any vessel could hunt seals in Alaskan waters outside of the three-mile limit.

—The rapid increase in the amount of flour exported from Oregon and Washington has an important bearing upon the development of the dairy industry, from the fact that it largely increases the supply of bran and shorts.

—Cattle are reported dying of starvation on the ranges of Arizona. The greatest loss is in Verde county, eastward from Flagstaff, and in the Skull Valley ranges, where the animals are perishing by thousands, the mesa being entirely bare.

—The San Diego & Yuma Railroad Co. has incorporated at San Diego, Cal.; capital stock $4,000,000. The company will ask the citizens to subscribe to a guarantee fund of $480,000 to secure 4 per cent interest on $4,000,000, the estimated cost of the road from there to Yuma.

—The Marysville and Nevada Power and Water Company has incorporated in Yuba Co.; capital stock $2,000,000; subscribed $1,040,000; directors, J. Spaulding, Auburn; J. O'Brien, L. Conrath, Smartsville; D. P. Donohoe, Marysville; R. C. Walrath, W. E. Englebright, Geo. L. Hughes, Nevada City; furnish electricity for power and light.

—The recently appointed forestry commission will soon begin its work of investigating forestry problems and outlining an administrative policy on the subject. The investigation will begin in Montana and extend into Idaho, Oregon, Washington, California, Colorado, Arizona and New Mexico. The work is expected to take up the time of the commission during the summer and autumn, at the end of which latter season the work of preparing a report for submission will be undertaken by the commission. There will be a preliminary meeting at Chicago next week.

—The possibilities of the fishing banks of the Pacific ocean are shown in the catch of the fishing schooner Annie, says the *Astorian*, which arrived on the sound lately with 18,000 pounds of fresh halibut, captured in a twelve days' cruise off the Cape Flattery banks. In that section the fish are sold at 2 cents a pound for home consumption and shipment in small lots. Halibut banks are found all along the coast, one ground being off Point St. George, in this county, where any quantity of these fine food fish can be caught, besides many other kinds of fish which command a good price in the markets. Other grounds in the near vicinity are those off Chetco, to the north, and off Trinidad, to the south.

Recently Declared Mining Dividends.

On the 1st inst. the Morning Star mine, Iowa Hill, Placer Co. declared a $7 dividend—its 63rd.

The Mammoth mines, Tintic district, Utah, paid a dividend of $20,000 on the 1st inst. This is the first dividend since 1891.

Calumet and Hecla Copper Company, Michigan, $5 per share, payable July 13, aggregating $500,000, making $45,850,000 in cash dividends to stockholders.

HOITT'S SCHOOL FOR BOYS

At Burlingame, San Mateo County, Cal., is one of the most thorough, careful and practical "Home Schools" to be found on the Pacific coast. It prepares boys for any university, technical school, or for active business; is accredited at the State and Stanford Universities, and under the able management of Ex-State Superintendent Ira G. Hoitt, Ph. D., ranks among the first schools in the United States.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention The Press and address, *Illustrated Weekly*, Denver, Colo.

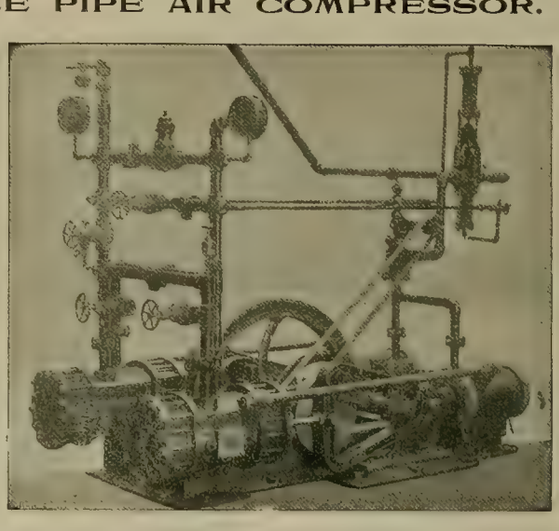
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

A Large, Valuable Mining Property For Sale CHEAP.

Situated within the Rich Mineral Belt

OF NEVADA COUNTY, CALIFORNIA.

From Emigrant Gap, C. P. R. R., distant in a northerly direction by wagon road eight miles, and consisting of nine full claims of 1500x600 feet each; all heavy veins from 2 to 10 feet wide, one 20 feet. One of which is patented; balance possessory title perfect, with sufficient development done upon six of the unpatented claims to entitle owners to patent. But one of the group has been operated by the present owners; this one (the Last Chance) is now being developed and the ore mills from $2.50 to $102.50 per ton, free gold, and has from the start to present time yielded a net profit of 30 per cent over total running expense. CAUSE FOR SELLING—The company has no capital, therefore the property is too large for us to handle satisfactorily. Would sell a part or all; would prefer to sell an undivided one-half. Price $18,000 cash; or for the whole, price $40,000 cash; or would give a working bond, price $60,000, 20 per cent cash. This is an unprecedented opportunity for mining men of capital to secure a large property at a reasonably small figure. Come and look at it. No middle men need apply. For further particulars, please address S. B. FOWLER, Maybert, Nevada County, California.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.

LIMITED.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

The Kendall system is covered by patents which this company will defend.

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

Owners of mines and reduction works can obtain full information on application to

KENDALL GOLD AND SILVER Extraction Company,

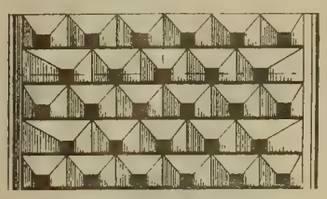
PAYNE'S
PATENTED
GOLD SAVING RIFFLE.

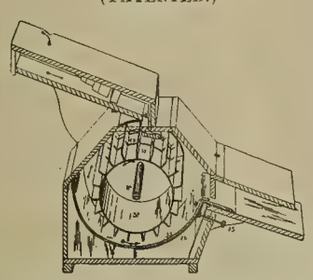


This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,
1710 Champa Street, DENVER, COLORADO.
☞Would sell an interest to right party.

VICTOR AMALGAMATOR
(PATENTED.)

FOR MILL OR



PLACER USE.

Greatest GOLD-SAVING MACHINE Ever Invented.

It will come nearer saving every color of free gold than any gold-saving device made up to the present time. Whether the gold is fine, flake or flour, its work is perfect. The only machine that works the black sands of the ocean perfectly, saving the fine flake gold contained therein. Our machines are now running on beach sand and on tailings from some of the best mills in California, and they are working successfully. We give guarantee with each machine. In working over old tailings from a stamp mill that contains free gold, amalgam and quicksilver, this machine has no equal. Send for catalogue and particulars. Manufactured only by the **VICTOR AMALGAMATOR CO., 703 S. Main St., Los Angeles, Cal.**

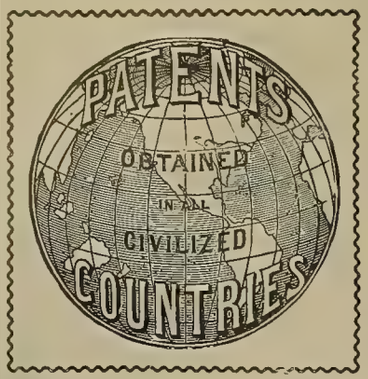
For the half year ending June 30, 1896, a dividend has been declared at the rate of four and twenty-six hundredths (4.26) per cent per annum on Term deposits, and three and fifty-five hundredths (3.55) per cent per annum on Ordinary deposits, free of taxes, payable on and after Wednesday, July 1 1896. GEO. TOURNY, Secretary.

DEWEY & CO'S
Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.
Advice and Circulars free.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

PACIFIC COAST AGENTS

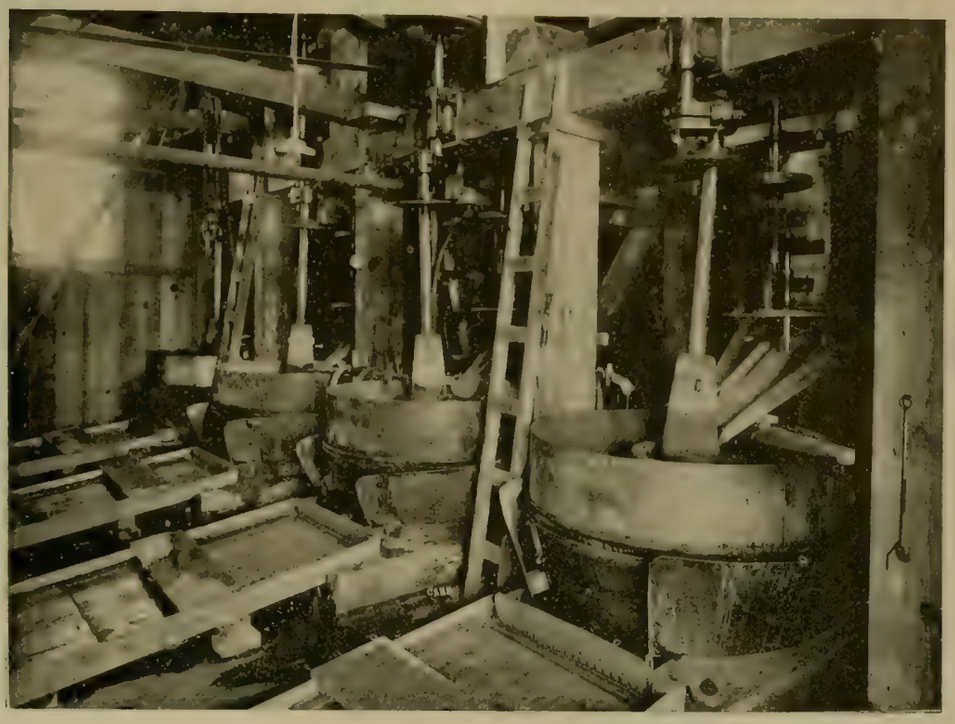
THE POOR MAN'S MILL AND ENGINE:

THE ..... DANIEL BEST CRUDE OIL .. ENGINE.....

CAPACITY,
2 to 200
HORSE POWER.

The Cheapest Power Known;
Invaluable Where Fuel is Scarce.

The most economical motive power ever invented, costing but 10 cents per H P. per ten hours run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.



THE KINKEAD QUARTZ MILL.

The Kinkead Quartz Mill will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine, to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

Price of Mill $1,000, f. o. b. San Francisco, including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole Mill. This Mill can be made in 300 lb. sections, if desired, at extra cost. Send for Catalogue.

Interior of Four Kinkead Quartz Mill Plant at Virginia City, Nevada, Equal to Twenty Stamps, Crushing Fifty Tons Quartz Daily Average.

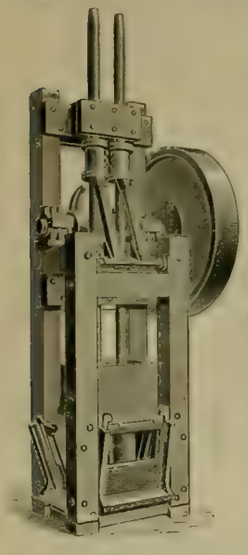
MINING AND MILLING MACHINERY.



"HENDY" IMPROVED
TRIPLE-DISCHARGE
Two Stamp Mills.

Superior to all other Mills of the same form for the following reasons:

First. Because **Two Stamps** will do **More and Better Work** in a mortar than any other number, as the motion of the stamps causes a discharge at the ends of the mortar, in addition to the front discharge, thereby increasing the stamping capacity, and leaving the pulp of uniform fineness.
Second. They are the cheapest mills to the stamp that were ever offered to miners.
Third. They do not slime the ores or flour the quicksilver, as the lateral motion of the pulp prevents such effect.
Fourth. They crush all kinds of ore, rock, cement or conglomerate perfectly.
Fifth. They are more durable, as the framework is secured to the mortar and thoroughly bolted together.
Sixth. The several parts are interchangeable and can be readily set up or taken down and duplicated.
Seventh. No skilled labor is required to assemble the parts.
Eighth. The discharge is larger in quantity to the stamp, and the number of drops per minute, (110) of the stamp is greater than any other mill.

Weight of Stamps (each) . . . . . 850 pounds.
Weight of Mill complete . . . . . 7500 "

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

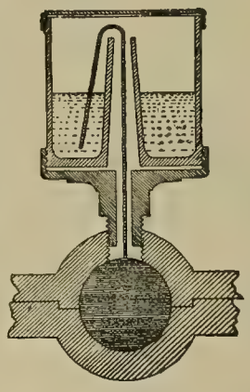
MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Positively Reduces Oil Bills 75 Per Cent.



THE FINCH OIL CUP.

Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.

During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

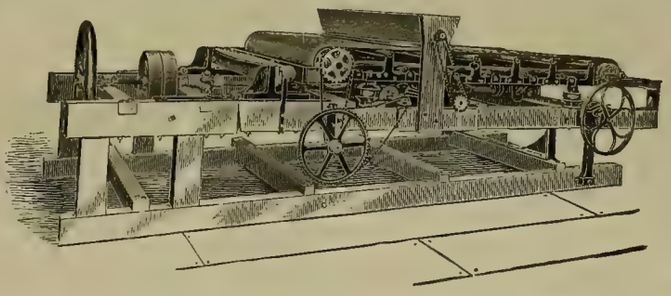
— SAVED —
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



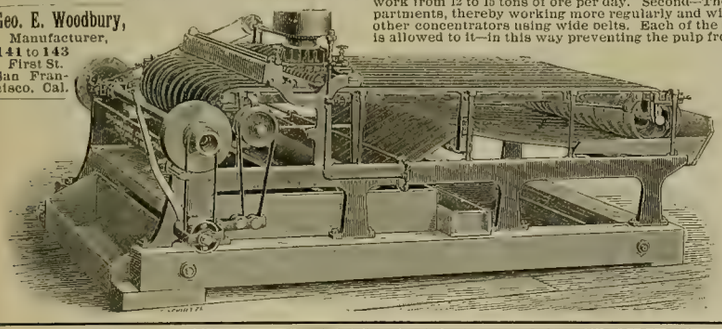
FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

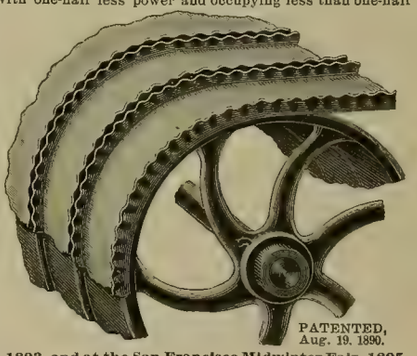
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

Market Reports.

The Markets.

SAN FRANCISCO, July 2, 1896.

Jobbers report a light call, but not more so than obtains at this season of the year. Two legal holidays in July, and so near together, are against much buying. It is the prevailing opinion that after next week there will set in a steady improvement and a gradual enlarging of orders. With manufacturers there is a continued good feeling, with confidence expressed that this fall will witness more activity than for years, and this, too, in the face of its being a presidential election year. These remarks have more particular reference to foundrymen and iron workers in general. There is a continued good demand for mining machinery and structural material. There is said to be more activity in the manufacture and also remodeling of railroad rolling stock.

The money market is reported easy, with the available surplus fund quite large. The demand is even light for this season of the year. The call for crop-moving purposes is not up to what was expected. The large shipments of fruits to the East will cause considerable money to be disbursed, as will the heavy payments due for interest and dividend. The disbursements on account of the two latter will aggregate large and add still further to surplus funds available for loaning. Considerable money continues to come in for mine purchases. It now looks as if there will be quite an increase in the boom in gold mining this fall and throughout next year. The Eastern money markets are reported quite easy, with a liberal surplus of funds on hand. This will be added to still further by the heavy disbursements, which are always a characterizing feature of the month of July.

New York Silver Prices.

NEW YORK, July 2.—Following are the closing prices for the week:

	London.	N. Y.
Friday	31 9-16	60⅛
Saturday	31 9-16	69
Monday	31½	68⅞
Tuesday	31½	68⅞
Wednesday	31 7-16	68¾
Thursday	31 7-16	68¾

	Copper.	Lead.	Iron.	Tin.
Friday	11 87½	3 00	11 50@12 50	13 50
Saturday	11 93½	3 00	11 50@12 50	13 50
Monday	11 50	3 00	10 50@13 00	13 40
Tuesday	11 25	3 02½	10 50@13 00	13 40
Wednesday	11 25	3 00	10 50@13 00	13 45

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½
New York Telegraphic Transfer	15
London Bankers' 60 days	$4.88¼
London Merchants	$4.88¾
London Sight Bankers	$4.89¼
Refined Silver, per oz., 1000 fine	62⅝
Mexican Dollars	54@55c

SILVER.—The Eastern and European markets have sold slightly lower, but this was to have been expected after the most urgent wants had been met. There seems to be a growing impression that market values will rule much higher before the fall months pass. What this opinion is based on it is difficult to say, unless there is to be a silver election campaign, which might stimulate speculative buying. There is another fact, viz: the increasing production of gold throughout the world will stimulate business, particularly if it should increase to over $200,000,000 this year. Among the first commodities to rise in price as the effect of this will be silver, because of the increased use of it for subsidiary purposes with the increase in business prosperity and confidence. In our market the inquiry is light for the time being. The last steamer for Hongkong took out $27,000 in bullion.

MEXICAN DOLLARS.—The demand is light. The last steamer for Hongkong took out 11,834 dollars. The market closed easier.

COPPER.—The market is quiet, but firm. The New York market has shaded off slightly. According to James Lewis & Sons of Liverpool, for the first five months of the calendar year the increased consumption of England, Germany and France is at the rate of 62,157 tons per annum. Last year the production of the world was about 8,000 tons less than the consumption. This year the production of the world (allowing for an increase of 35,000 tons), promises to be fully 35,000 tons less than the consumption, leaving a stock of about 8,000 tons at the end of the year. So many orders have already been booked by consumers for delivery over the next six months, that a much higher range in prices, which seems inevitable, will have little effect on consumption, while production cannot be materially increased for some time, as that of the American mines is dependent on the extent of their concentrating and smelting plant, which it would take many months to enlarge. The paper read by the Constructor-in-Chief of the Imperial German navy at the meeting of the Institution of Naval Architects will probably lead to the general substitution of electricity for steam as the chief motive power on board war and other ships.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is steady with a fair export demand.

The market is quoted as follows:

Home trade, per flask	37 00
Distant points up north	36 25@37 00
West coast of Mexico, for export	32 50

ANTIMONY.—The demand is slow, with the market easy at 8@9c in a jobbing way. New York mail advices quote 7½@7¾c for Cookson's, 6½c for Hallett's and 6½c for Japanese, from store.

LEAD.—The market is essentially unchanged. The New York market is reported quiet with consumers and dealers indifferent, while speculators manifest only a curious interest.

Pig	3 75	@	4 00
Bar	—	@	4 15
Sheet	—	@	5 50
Pipe	—	@	4 75

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The market is dull and in buyers' favor for both pig and plate. The East reports a quiet market with consumers not anticipating their wants.

The market is quoted as follows:

Pig, per lb	14½c
Plate, I C coke, heavy, per box	$4 25
" " " light, "	4 10

BORAX.—The market is quoted as follows

Refined, in car lots	6½
Refined, in sacks	5⅞
Powdered, in car lots	6⅛
Concentrated, "	5⅝

POWDER.—While the East reports a firm market at recent advances, our market is unchanged. The demand here is unusually large, mostly for mining purposes.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, "	8½c

COAL.—There is absolutely nothing new to report in our market since our last review.

SPOT FROM YARD—PER TON.

Wellington	$7 50@ 8 00

LUMBER.—There is a fair home and export demand.

The market is quoted in this city from dock or yards as follows:

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—Jobbers report a fair demand at quotations.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 22½
" jobbing, " "	3 35
Cut, carloads, " "	2 97½
" jobbing, " "	3 10

Mining Share Market.

SAN FRANCISCO, July 2, 1896.

The market has been quieter, with prices generally lower, particularly for shares in the middle and north-end group. The decline was fully 25 per cent in all except Con. Virginia and the Gold Hill shares. These only went off from the best figure of the week about 15 per cent. At the lower prices the Gold Hills rallied from 10 to 25 per cent. At the lower figures there was a general unloading of margins. Under these sales the market was made to look so disgustingly broken up that few outsiders had the temerity to buy, consequently the inside pool secured a large line. A singular feature of the down market has been the way in which it was made to appear as if it was going to pieces on each decline. This demoralized appearance enabled the pool to get about all the shares sold by outsiders, and yet they are, seemingly, not satisfied, for points are out that there will be still lower figures after the holidays, after which there will be another deal. In the buying the pool has been aided by bear write-ups and well distributed bear points by cappers and others. While the writer does not claim to know how the market will be worked yet, judging from the work done and that is being done in the mines, the shares of the north-end and Gold Hill mines are selling below what they should from a speculative standpoint. They have never failed in rallying and bringing a good profit to those who bought at around present figures and did not hold in expectation of bonanza prices. There is a belief in well-informed circles that we will soon see another four or five dollar deal and that Chollar will not be the leader. They look for several of these little deals. If this proves correct, and the work going on in the mines looks like it, then there will be more or less activity throughout the year, and those who take their turns will more than likely come out ahead.

No assessment was levied this week, but, if reports are correct, there are from six to ten to come on during the current month. The mines cannot be worked on gas (this has no reference to Con. Virginia), for it takes money to pay miners, officers and others.

The news from the Comstock mines points to more activity than for several years. More men are being added, with larger additions to the working forces expected in this and the coming month. Of necessity this will depend largely on how the pool has the shares, for it is not at all likely that it will be done if the public has the bulk, unless there has been a radical change in working the mines, according to how the shares are held. In Alta they will soon be in position for better exploiting, and as the company has money on hand better things ought to come from it. So far as the public are advised no work is being done in Confidence, but in Overman more men have been put on to follow up the seams of ore on the 900-foot level. The official letter from Seg. Belcher reports the raising of fair grade ore—assaying around $20 a ton. Belcher has milled 425 tons of ore and is raising about 50 tons each week. No particulars are made public as to work going on in these two mines. At date of last weekly letter there was still 15 feet in the upraise from the 700-foot level so as to connect with the 600-foot level. When this is done good ventilation will have been secured, which will enable the company to extract, raise and mill the gold ore between these two levels. It will more than pay expenses. It is stated that quite an increase will be made on or about the 20th of this month in the number of miners at work in Crown Point and two or three other Gold Hill mines. In Confidence they are still raising for surface connection for better ventilation so as to work Challenge and Confidence to better advantage. In Con. Imperial they are still pushing ahead to joint Confidence, Challenge and Con. Imperial west crossdrift. Work is also being done in another west crossdrift. In Alpha they are still at work on the 500-foot level. In Bullion work is continued in the long west crossdrift. Gould & Curry and Best & Belcher are running a joint east crossdrift from the Bonner shaft. Advices from Con. Virginia report an improvement in the south drift towards the Best & Belcher, on the 1650-foot level. They are about 175 feet from the south boundary line of Con. Virginia. They are again extracting ore. The bullion return from the ore milled was $34,756. In Ophir the ore found on the central tunnel has improved in value, but it is too low grade yet. Work is still being pushed to the west on the 1000-foot level, as it is in Mexican. In the latter mine the formation is said to have improved. The work under way in Union, Sierra Nevada, Utah and Andes is about the same as heretofore reported. In the middle mines the work in Potosi and Chollar is on same levels heretofore reported, with no particular change noted. They are raising fair grade ore each week from the latter mine. In Hale & Norcross they have made connection between two levels for better working. They are still running for ore found in Savage. A few tons of ore are raised each week. The official letter from Savage reports that 182 cars of ore were raised, assaying over $28, and 150 tons had been milled which gave over $29, battery assay. They have a large quantity of this ore still in sight.

From the Brunswick our advices are to the effect that more active work is being done than at any time since the lode came to the front. The official letter from Occidental reports that on the 750-foot level $14 gold ore was found in the south drift and $20 gold ore in the north drift. This shows that the ore continues downward. Its width was not stated. In Hale & Norcross they broke the record in drift mining, 48 feet being made in a week. The south drift got up to the Chollar line on the 300-foot level yesterday when the latter company took up the work with the same number of men. It is reported that 100 feet will be run before a cross drift is started, but of its correctness we are not advised. The north drift on the same level in Hale & Norcross is being extended toward the Savage line. The work in the latter mine is on the same level and same direction reported last week. In Gould & Curry the most important work is being done. It is closely watched by mining men and good results are predicted with confidence by those in position to know. The joint shaft in Best & Belcher is still being sunk. In Chollar they are running an east cross drift from the 200-foot level drift.

From the Bodie mines the news is unimportant. Work is being carried on at several points in Bodie, but the ore encountered is reported low grade. More or less exploiting work is being done in Mono and Bulwer.

The following illustrates the changes of the week:

THE CALIFORNIA DEBRIS COMMISSION having received applications from the following persons to mine by the hydraulic process, viz.: In El Dorado County: John J. Flora, in the Buckeye Hill Mine, near Volcanoville, to deposit tailings in Buckeye Canyon; Giacomo Varozza, in the Try Again Mine, near Placerville, to deposit tailings in a ravine below the mine; Giovanni Raffetto, in the Raffetto Mine, near Placerville, to deposit tailings in South Weber Creek; J. R. Vandergrift, in the Maylone Mine, near Indian Diggings, to deposit tailings in Indian Diggings Creek. In Tuolumne County: F. W. Eaton, in the Cook Gravel Mine, near Montezuma, to deposit tailings in State Gulch, A. P. Scheld, in the Marlow Mine, near Sonora, to deposit tailings in Turn Back Creek. In Nevada County: Eber A. Sanford, in the Deer Creek Mine, near Mooney's Flat, to deposit tailings in an old pit. In Plumas County: California Gold Mining and Investment Co., in their claim, near Taylorville, to deposit tailings in Foreman Canyon; Henry W. Orr, in the Slate Creek Mine, near Spanish Ranch, to deposit tailings in the Hartley Fork of Slate Creek. In Placer County: Barney Cavanaugh, in the Parke and Brown Mine near Ball Mountain, to deposit tailings in a ravine; Shirley Mining Co., in the Shirley Gravel Mine, near Michigan Bluff, to deposit tailings in Dutch Gulch and Poor Man's Creek; and William Phillips, in the Phillips Claim, near Colfax, to deposit tailings in Dry Creek—gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on July 20th, 1896, at 1:30 P. M.

Sale of the De Lamar Mine.

A Salt Lake, Utah, dispatch says an English syndicate, represented by Charles M. Rolker, has bought the De Lamar gold mine at De Lamar, Nev., and Mr. Rolker is now in Salt Lake waiting for the legal transfer before assuming control of the property.

Mr. Rolker made an exhaustive examination of the mine for the new owners and the purchase followed. In his report Mr. Rolker shows that $200,000 had been spent on the property in equipment, water supply and electric plant. Ten thousand tons of ore have been milled from the mine, producing $650,000 in less than five years. Captain De Lamar paid $200,000 originally for the property.

It now has 20,000 feet of development nearly all in ore and is producing about $200,000 a year in gold bullion. The ore is handled by an electric tramway and the bullion is hauled to Milford, Utah, the terminus of the Union Pacific, 170 miles by stage with armed guards. The price of the property is not definitely known, but it is believed to be about $3,000,000.

THE action of the Rothschilds in picking up copper holdings is explained by the statement that a recent discovery made in Europe shows that copper is superior to steel for making armor plates for war vessels, having greater powers of resistance. As the Rothschilds will furnish the money wherewith to build the ships, but it is natural that they should furnish the copper, and their efforts in that direction show that they are prepared to pay something handsome for the control of the copper output of the world. The explanation, though plausible, is very unlikely.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JUNE 23, 1896.

562,688.—FRUIT PICKER, ETC.—Baisley & Decker, Los Angeles, Cal.
562,510.—OAR—E. B. Cleaveland, Snohomish, Wash.
562,451.—WASHING UTENSIL—Mary M. Davis, South Pasadena, Cal.
562,716.—STEP LADDER—C. H. Dyar, Ontario, Cal.
562,784.—LEGGING—C. Fisher, S. F.
562,742.—DENTAL ENGINE—O. H. & A. F. Pieper, San Jose, Cal.
562,418.—JAR SEALER—S. B. Ragatz, Los Angeles, Cal.
562,680.—WRENCH—A. Willons, Redlands, Cal.
25,665.—DESIGN FOR CAN—E. H. James, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Out This Week.

AARON'S ASSAYING: PART FIRST, THIRD EDITION. Rewritten by the Author.

PRACTICALLY A NEW BOOK.

This standard work on Assaying has received high praise from leading assayers and metallurgists throughout the world.

This Third Edition is believed to be all that is required, and assayers and mill men everywhere will find it of practical value. Price One Dollar, postpaid. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco, Cal.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of boading or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Stores county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 20 day of June, 1896, an assessment (No 23 of fifteen cents (15c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No 69 Nevada block, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of July, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY the 28th day of July, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office, Room No 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

NIMSHEW GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Nimshew, Butte county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1896, an assessment (No 1) of Three cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Mission Pier, No. 1, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of July, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 3d day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. D. COOK, Secretary.

Office, Mission St. Pier, No. 1, San Francisco, California.

MARGUERITE GOLD MINING AND MILL CO. Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 18th day of June, 1896, an assessment (No. 3) of Ten Cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of July, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on FRIDAY, the 28th day of August, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office—237 12th St., San Francisco, California. Office hours from 4 to 6 P. M.

MINERS' OUTFITS.

IRON MORTARS, AMALGAM MORTARS, GOLD WASH PANS, MINERS' HORNS, BATEAS, CRUCIBLES, HORSE-SHOE MAGNETS, MAGNIFYING GLASSES, IRON RETORTS, CHEMICALS, SCALES, WEIGHTS, ETC.

Including a full assortment of Mine and Mill Supplies, Assayers' Materials, Etc.

Agents for Baker & Adamson's Chemically Pure Acids. A full stock always on hand.
Nitric Acid, sp. gr. 1.42; Muriatic Acid, sp. gr. 1.20; Sulphuric Acid, sp. gr. 1.845.

JOHN TAYLOR & CO.,
63 First St., San Francisco, Cal.

New Illustrated Catalogue and Assay Tables on application.

You Can Get $s for Cents!

CRIPPLE CREEK

Is producing $1,000,000 per month, and the output is steadily increasing and making fortunes for investors in mines and stocks. The CRIPPLE CREEK AND CALIFORNIA GOLD MINING & MILLING COMPANY OF SAN FRANCISCO are rapidly developing their group of mines, located on Little Bull mountain near the city of Victor, in the gold-bearing belt of the greatest gold camp in the world.

A LIMITED NUMBER of the shares of the treasury stock will be sold for the purpose of development at the price of Ten Cents per share. The par value is One Dollar, and under the laws of Colorado are absolutely non-assessable.

For prospectus and full particulars call or address E. B. MYERS, Secretary, Room 30, 139 Post Street, San Francisco.

THE BEST BOOKS

Are always the CHEAPEST. All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
220 Market Street . . . . . San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition. Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations well bound in cloth, 1896. Price, postpaid $1 00

Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid $1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth $3 00

Prospector's Field Book and Guide.

By H. S. Osborn $1 50

A Practical Guide for Prospectors and Miners

By C. W. Moore. With numerous illustrations $4 75

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid $6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid $3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid $3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth $5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated $5 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated $5 00

Losses in Gold Amalgamation.

By W. McDermott and P. W. Duffield $2 00

Electricity in Mining.

By Sylvanus P. Thompson . . . . . 80 cts.

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid $5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated $4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.

By T. E. Van Wagenan $1 00

The Sampling and Measurement of Ore Bodies in Mine Examinations.

Well printed on fine paper, with plates; complete. Price, postpaid . . . . . 25 cts.

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth $4 00

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth $3 50

Manual of Determinative Mineralogy.

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth . . . $3 50

Metallurgy of Silver, Gold and Mercury in the United States.

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo $7

Metallurgy of Silver, Gold and Mercury—Continued.

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth $7 50

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth $2 00

A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn $4 50

Matte Smelting—Its Principles and Later Developments with an Account of the Pyritic Processes.

By Herbert Lang $2 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth $1 50

Practical Metallurgy and Assaying.

By A. H. Hiorns $1 50

The Practical Metal Worker's Assistant.

By Oliver Byrne. Illustrated $5 00

Quartz Operator's Handbook.

By P. M. Randall $2 00

Assayer's Guide.

By Oscar M. Lieber $1 50

Assayer's Manual.

By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated $3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.

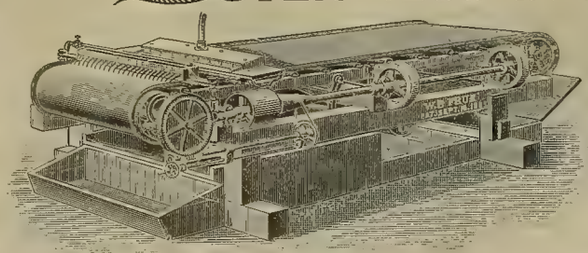
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 535 pp. Price, postpaid $2 50

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Knots and Splices in Manila Rope, 25. Part of the Young Sequoia Gigantea Grove at the Chico Forestry Station, 28.

EDITORIAL.—Majorities in the Coming Presidential Election; Gold Discoveries on the Desert; Mining the Backbone of the Country's Prosperity; Decision by the U. S. Supreme Court; Individual Owners of Gold Mines; Mining in Butte County; Other Mercur Districts; Improvements in Gold Milling, 26.

ELECTRICAL PROGRESS.—Electricity Direct from Coal; Uses of Electricity in Metallurgy, 29.

SCIENTIFIC PROGRESS.—Mysteries of Science; Mountain Ranges; A New Respirator; Electricity for Whaling; The New Highway, 30.

MECHANICAL PROGRESS.—Air Hoist Table: A Large Pair of Turbines; Fly Wheel Calculations; Blasting Under Water; Torpedo Destroyer Desperate; New Method of Preparing Alloys; Sonorousness of Aluminum; Iron and Steel Tools; Metals Capable of Combining with Argon, 30.

PRACTICAL INFORMATION.—Nervous Strain of Railway Work; Why Stone Walls are Damp; Celery a Cure for Rheumatism; Definite Understanding Between Parties in Commercial Transactions; Chilly Feeling; Cracking of Rubber; The Influence of Fatigue Upon the Nervous System, 31.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 34-35.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 42.

MISCELLANEOUS.—Concentrates; Status of the Miner—Past and Present, 27. The Old Prospector; Young Sequoias; Keeping Copper Plates Bright, 28. Knots and Splices in Manila Rope, 29. California Mines and Miners, 31. Personal; Recent California Mining Incorporations; Recently Declared Mining Dividends, 35. Coast Industrial Notes; Commercial Paragraphs, 36. Notices of Recent Patents, 38.

IN the coming presidential election if all the men who believe in protection will vote for the protection candidate he will have a tremendous majority. If all who believe in free silver vote for one and the same free silver candidate he will have a majority.

RECENT reports of gold discoveries "on the desert" and elsewhere in arid sections of southern California direct renewed attention to the profitable work of bringing water on gold placer ground. The "dry-washer," while an ingenious device practicable on a small scale, cannot handle pay dirt in large quantities as profitably as hydraulicking can. The counties of San Diego, San Bernardino, Riverside, Kern and Ventura have given abundant evidence of the profit possible by the bringing of water on dry gold placer ground, a project that promises return second only to the product itself.

IN these days of shrinkage in real estate values, stagnation in the price and sale of all agricultural products, loss in railroading and general lack of profit in the business world it is noticeable that the one business that men have declared less creditable and more of a gamble than anything else is the one business that gives the greatest promise of profit. Miners are to-day men who keep going, pay their bills and are living through the hard times in a way to compare favorably with those who have constantly decried and derided them, thus showing what has often been said that the backbone of the country's prosperity is the mining of the precious metals.

THE United States Supreme Court has made a decision in the case of Haws vs. Victoria Copper Mining Co., reversing all the precedents of older decisions and the customary practice of miners in locating mining claims. It has held that a valid mining location may be made without marking the boundaries on the ground or even of posting a notice on the ground located. The practical effect of this adds additional uncertainty to the mining titles based on location only. Under it old locations supposed to be invalid by reason of not being marked on the ground can be revived, to the injury of locators who have in good faith definitely marked their claims. Despite the decision, it is preferable that locators should carefully mark their claims out on the ground so that they can be readily traced and identified as the boundaries of a mining location. Also, the notice should preferably be posted on the ground and maintained there. This course will certainly be a protection against any subsequent locator, though, under the decision referred to, it would not avail against a prior locator who did not mark his claim boundaries or post any notice on the claim. Another point on which the decision bears is the location of two or more claims on the same lode by the same locator. This is inferentially validated. Also, two or more adjoining placer locations may be made by the same locator—in fact, there is no limit to the amount of territory one locator can tie up without incurring any expense except the minor one of recording, from January 1st of one year to the 31st of December of the following year. Is Senator Stewart going to live forever?

Improvement in Gold Milling.

In a late number of this paper we quoted from an article by H. M. Chance in the *Engineering Magazine*. For the most part Mr. Chance's paper is devoted to a review of what has been accomplished by new methods of treatment substituted for or applied after the ore has passed through a stamp mill, but he very properly indicates the first step to be the determination of what can be done in the stamp mill itself, and by tests and trial crushing through different screen meshes. Mr. Chance's paper, while it states conclusions, does not give the details of methods, and it is believed that the following, in view of the importance of the subject, will be found practically useful to gold miners.

In the stamp mill additional, besides the improvement made by narrowing the battery, lowering the discharge, increasing the rapidity and diminishing the height of the drop, and in preliminary fine crushing in a rock breaker, the weight of the stamp itself is an important factor. The stamp head duty has something more than a direct ratio of increase with increase of weight, and the amount of mill labor required is measured by the number of stamps, not by the weight. In other words, no more labor is required for, say, twenty stamps weighing 1000 lbs. each than is required for the same number of stamps weighing 700 lbs., yet the former crush half again as much ore as the latter, correspondingly reducing the labor item of cost of crushing per ton. It is therefore preferable in mill construction to concentrate the required total stamp head weight into the smallest possible number of heads. It effects a direct economy of operation very considerable in amount, and is, if anything, measurably less costly in initial installation. It is hardly possible to make a mistake in the effort to secure this economy.

Any millman can make the simple tests and estimate the data for fixing the economic maximum of screen mesh and rate of stamp head crushing for the particular ore he is treating. With two or more batteries in the mill the trial runs can be made by using the compared screens along side of each other thus insuring uniformity in the conditions of the trial, which should extend over sufficient time to further eliminate the effect of incidental inequalities. For each trial run and different screen mesh the millman should keep data as follows: 1.—The exact time of drop of the stamps of each battery and of the unavoidably lost time.—2. The amount of ore crushed by each battery during the run. 3.—The value of the retorted bullion obtained from each battery and plates during the run. 4.—The value of the concentrates saved for each battery. 5.—Taking as a unit, the finest screen mesh of the test, tailing samples from the batteries using the other screens should be screened on the finest screen and the percentages of coarse and fine tailings noted. Each should be assayed separately and the assays noted in connection with the percentages. Examination should be made of the tailings to determine whether or not concentratable material is being lost. The assays of the fine tailings should be the same, independent of the rate of stamping and the only additional loss mechanical, in the coarse particles. It should be noted that it may be necessary to increase the plate areas with increased discharge. 6.—The cost of screens used for each battery should be noted. From the preceding data the following ton figures would then be calculated. 1.—Number of tons of ore crushed per 24 hours (actual time of stamp drop and unavoidable lost time per stamp head). 2.—The yield per ton of ore of gold from battery and plates. 3.—The yield per ton of ore of gold from concentrates. 4.—The loss per ton of ore in tailings passing through the finest mesh screen. 5.—The loss per ton of ore in the coarse tailings in excess of what it would be if fine crushed. 6.—Cost of screens per ton of ore. 7.—The total labor, power and supply cost of milling (exclusive of screens) divided by the total number of stamps dropped for units of 24 hours determined as above gives the cost of operation per stamp head, which in turn divided by the stamp duty with each screen mesh gives the cost of treatment per ton. 8.—From the preceding the net profit margin per ton of the milling. The point of highest economic efficency is then readily determinable from comparison. In making these comparative tests the precaution should be taken not to overload the concentrating plants with pulp from the coarser crushing batteries. As a general proposition increasing the battery discharge requires corresponding increase in the concentrating plant.

Where auriferous gravel is stamped the tests to determine the point of highest economic efficiency or largest profit margin are simpler, no account having to be taken of concentrates. It is suggested that more often than otherwise auriferous gravel is crushed too coarse and that in nearly all such mills the profit margin is possible of increase.

THE possibilities of there being other Mercur districts awaiting discovery and development is worth consideration. Nevada, California and Oregon all have localities in which there is a general identity of geological conditions and similarity of mineral deposits. Steamboat Springs, in Washoe county, Nevada, are the dying out activities of the solfataric action to which may be referred the formation of adjacent cinnabar, sulphur and alumina deposits. There is nothing unreasonable in the supposition that a deposit of gold has accompanied the cinnabar and that somewhere in the deposits made or forming the former will be found. There is a similarity of geological conditions to the Mercur deposits, also to the deposits bearing gold and cinnabar in Colusa County, Cal., at the Manzanita and adjacent mines, and also to the conglomerate carrying gold and cinnabar found in the Golden Fleece mine, near Ashland, in Jackson county, Oregon. In this latter deposit granite is the underlying country rock on which rests conglomerate and sandstone strata. The conglomerate being comparatively permeable mineralized waters have deposited cinnabar and gold all through it instead of in distinct veins or seams. There is an opportunity for some prospecting in this last deposit. Except in the Golden Fleece, only placers from its erosion have been worked.

FROM the local papers Butte county is evidently receiving its share of the impetus gold mining is experiencing in California. Quartz, drift and river mining are looking remarkably well, increasing in number of separate operations, in the number of men employed and the gold output. The latter has doubled in the last six years. Not the least promising feature of the advance is the permanence and prosperity of the quartz mines carrying their gold in sulphurets. This is the industry of Forbestown district, where the success of the Gold Bank mine has demonstrated the values that await capital and intelligence in the sulphuret gold ores. In drift mining, also, Butte county has vast dormant possibilities. On the Magalia ridge there are miles of buried channels untouched and unprospected. This county is certainly promising enough to justify the expense of the comprehensive surveys and maps which in Placer and Nevada counties have so materially aided the mine owners in locating the buried wealth of the ancient rivers.

THE individual owners of big paying gold mines can be counted on the fingers. As a rule a large paying concern is owned and operated by a company. The plain reason is that, no matter how rich the property may be, rarely can the discoverer or any one man put up the necessary money to develop and operate the mine till its richness is established and it is a steady dividend producer. The mine may be a good one, the property well worth developing, but no matter how thoroughly this may be understood by its discoverer or individual owner, he can do, ordinarily, nothing without the aid of outside capital. And even in the rare cases where the owner of a mine has the money to develop it it takes more than he can afford to put into any one project. Because of this nearly every mine of any consequence is owned and operated by a company, a co-operative concern that jointly puts up enough to develop the property, doing what few men singly could or would do.

Concentrates.

THE Tamarack, Mich., copper mine has two vertical shafts each 4450 feet deep.

SPAIN has pawned her quicksilver mines for 100,000,000 pesetas to the Rothschilds and proposes to be ready for war.

ABOUT 200 men are employed by the Mountain Mines Co. at Keswick, Shasta Co., on railroad work. The smelter is still idle.

THE comparatively rare mineral, Maraposite, is found in large quantities in the Marguerite quartz mine at Auburn, Placer Co.

"A LONG STRIKE" is the present one at Leadville, Colorado, the demand for $3 per day being but one of the local complications still unsettled.

AN incendiary fire destroyed the chlorine works of the Consolidated Mining and Milling Company at Deadwood, S. D., last Monday; loss, $100,000.

INQUIRY is being made for large quantities of quartz-mill tailings. Miners having such tailings might derive substantial advantage by letting the fact become known.

AT Lead, South Dakota, in June there were 48,214 tons ore milled; Homestake, 100 stamps, 10,500 tons; Highland, 160 stamps, 14,054 tons; Star, 200 stamps, 22,660 tons.

THE third edition of that popular work Aaron's assaying, Part I, appeared last week. About the last life work of its late distinguished author was the revision and rewriting of this edition.

THE copper product of the Kearsarge, Mich., Copper Mining Co. is stated to cost 9.22 cents per pound. Working under more favorable conditions, the Tamarack Mining Co. of that State produces refined copper at a total cost of 5.18 cents per pound at the mine.

A RATHER exceptional accident occurred in the Independence mine at Grass Valley this week, fortunately injuring no one. While lowering the cage with a car on it the water wheel broke, followed by the breaking of the cable as soon as the brake was applied.

THE Gold Bank mill, at Forbestown, Butte Co., with 40 stamps, crushes 143 tons every 24 hours, an average per head of 3.575 tons. This is a close approximation to the average practice in South Africa, and is considerably in excess of the average in this State.

THE Oregon Railway & Navigation Company was sold at Fairview, Or., last Thursday, to Marcus, Beeman and Fairchild, purchasing committee appointed to buy the road for the reorganization committee, for $9,437,250, in pursuance of a plan of reorganization considered by bondholders.

THE total dividends paid in the first half of 1896 by the stock companies of Cripple Creek are: Portland, $120,000; Moose, $22,000; Victor, $120,000; Union, $48,000; Isabella, $112,500; Gold and Globe, $23,250; Elkton, $20,000; C. O. D., $5,000; Princess, $20,000; Moon-Anchor, $18,000; total, $508,750.

CALIFORNIANS should not stampede at every newspaper mention of distant mining districts as a poor man's camp, with prospects paying from the surface down. Such mines and localities are as common in California as anywhere else, as the large annual gold production by small mines proves.

"THE Silver King," "The Silver Queen," etc., of the halcyon days of silver mining are no longer so numerous. They have given place to "The Golden King" and Queen, and sometimes the Jack. The names are, however, a little overused. In Butte Co., this State, there are two "Golden King" mines and three "Golden Queens."

A COMPENDIUM of the mining decisions of the California courts in mining cases would be a valuable book for our miners. The State mining statutes are not so extended as to require compilation as has been done in Montana and Arizona, and all our local laws are practically made by the decisions made on the U. S. Statutes.

THE high flume carrying the Miocene ditch between the two Table mountains, near Oroville, fell last week. It will not likely be rebuilt, as the water supply of the ditch now used for irrigation can be utilized equally well below the break through the Hendricks ditch and the Magalia ditch. The high flume was only necessary when the water was used for hydraulic mining at Oroville.

ACTING Secretary of the Interior Reynolds has apportioned the $325,000 appropriated at the last session of Congress for surveys. Under this division California's Surveyor-General is allowed $15,000, Nevada $2,500, Oregon $15,000, Washington $40,000, and Arizona $6000. Fifteen thousand dollars will be spent for surveys, $40,000 for the examination of surveys, and $10,000 held in reserve for emergency use.

IN the State Mining Bureau's large collection of minerals from all parts of the world are several specimens of gold quartz from Luzon, one of the Phillipine islands, which are declared to be from the extinct volcanic mountain of La Trinidad, where native miners work the ore by the most primitive method. They pulverize the quartz by hand in stone mortars at the mine and carry it in baskets down the mountain to a stream, where in the rudest way it is washed.

THE first of a series of bulletins to be issued by the School of Mines of the University of Wyoming on the petroleum industry of that State has been published. It gives a history of the Salt creek field and the results of field geological investigation and analysis of the oil. It is a creditable production and in line with practical work that the School of Mines of our State University might carry on without entering on the special field of operation of the State Mining Bureau.

COPPER consumption on this coast is on the increase. At present it approximates 400 tons ingot copper annually. The building of war ships and renewed activity at Mare Island has created better demand. The annual consumption of lead on this coast is probably 7000 tons. Beyond speculative probabilities the outlook for increased price in silver is not considered brilliant. Gold is in ever present demand at $20.67 per ounce 1000 fine. In the latter metal there is no competition, the supply does not exceed the demand and freight charges are at their minimum.

SYENITE differs from granite in having little or no quartz, and hence a lower percentage of silica, which varies from 45 to 65 per cent. It consists essentially of orthoclase feldspar and hornblende, pyroxene or mica, hornblende being the most common, and while dark mica (biotite) is not uncommon, the light mica (muscovite) is exceedingly rare. There is generally a greater proportion of the basic feldspars than in the granite. The term syenite was formerly used for what is now called hornblende granite. True syenite is not as abundant and as widely distributed as is granite.

PLATINUM, found in connection with gold ores in this State is not a very prominent part of California's mineral products, the yield in '95 being but 150 ounces, valued at $800. A curious method of producing platinum is reported from the Tura river in the Russian government district of Tomsk, Siberia, called "plowing the water." A raft is constructed and an inclining gutter of boards fastened to it, which at its lower end is provided with an iron plow. While floating down the river they scrape or plough its bottom. The sand scraped out falls into the gutter and passes into a tub filled with pine boughs, upon which platinum is deposited. The sand of the Tura river and its tributaries is so rich in platinum and its primitive production so profitable that the peasants are abandoning agriculture and devoting themselves to "plowing the water."

THE State Mining Bureau has just completed the field work of an investigation into the oil-producing possibilities of the State. W. L. Watts, Field Assistant to the State Mineralogist, has been engaged for a year and a half on this work. The oil districts of Santa Barbara, Ventura and Los Angeles have been surveyed and mapped by him to determine the position of the geological formations yielding the oil and to serve as a guide in further prospecting. Mr. Watts expresses the opinion as a deduction from his work that the oil-bearing formations extend from Humboldt to San Diego county following the coast range. It is anticipated that the determination of the stratigraphical position of the oil-bearing rocks made by him will assist the prospecting and development of many new districts in this extended region. The maps and data prepared by Mr. Watts will be published by the Mining Bureau in pamphlet form.

IN the last volume of this journal—the 26 numbers from January to June of this year inclusive, the mines of Amador county received thirty-eight notices varying in length from six lines to a column. Similar prominent mention was made of the mines of Butte county 27 times, Calaveras 43, Colusa, 3, Del Norte 6, El Dorado 29, Fresno 4, Humboldt 3, Inyo 12, Kern 15, Lassen 8, Los Angeles 8, Mariposa 27, Marin 3, Merced 4, Modoc 4, Mono 18, Orange 3, Nevada 38, Placer 29, Plumas 21, Riverside 16, Sacramento 8, Sonoma 4, San Bernardino 18, San Benito 4, San Diego 24, Santa Barbara 4, Shasta 31, Sierra 24, Siskiyou 32, Trinity 28, Tuolumne 28, Tulare 3, Yuba 10. Alaska mines have mention in 21 different places, Arizona 26, British Columbia 29, Colorado 39, Idaho 28, Lower California 18, Mexico 13, Montana 31, Nevada 28, New Mexico 21, Oregon 32, South Dakota 18, Washington 9, Wyoming 15, Utah 27, Australia 18, South Africa 29.

A VANCOUVER, B. C., dispatch published in the Eastern papers says: "A mining boom has fairly struck this province, fully two weeks before the time prophesied. There are scores of English and American millionaires in Kootenay and other parts of the province, while all the best mines in some districts have within the past week been bonded by English capital sent to agents here. New York and San Francisco capital is also largely represented. Hundreds of thousands of pounds of English money, drawn from South Africa and Australia, are being placed in British Columbia. The latest discovery is a 10-foot vein of gold-bearing ore near Vancouver, in the Lillooet district on the Frazer. It is free-milling ore and runs $1000 to the ton on an average, and is said to be the richest vein yet discovered in the province. A ledge has been discovered on Barclay sound, near Victoria, which is 30 feet wide. There is over a million dollars in sight." Such lies deceive nobody. Better a thousand times the conservatism of this State, that says little of its great mining wealth, than such barefaced mendacity that hurts everything and helps nothing.

THE prehistoric mine of Aramo, near Pola de Lena, in the Austrias, remains the same as in the Bronze Age, 30 centuries ago, having been surprised either by a cataclysm or by a hostile invasion. The entries consist of small vertical shafts of a mean depth of 18 feet, at the mouth of which soldiers probably kept watch to prevent the slave miners from escaping. In one place a skeleton was found bent double in the position of working, and in a fall, a little distance off, another skeleton with tools of horn and polished stone, matches, allumettes, of resinous wood the size of a pencil, and torches smeared with fat. Small tubs of wood, with the bottom consisting of a separate piece, sewn together with thongs, served to take up the ore. Throughout the whole mine no trace was found of an iron tool or of timbers; but the miners must have driven their headings with great patience and considerable muscular force. At the present time a drift is being pushed forward into the same rocks with the best drills and dynamite; but the advance is only 16 feet per month. Everywhere finger marks are found on the clay, in the cracks, which was taken out by the hand. The mine has been worked for a vertical height of 492 feet and 14,350 square yards have been worked in a large number of veins from 8 inches to 7 feet 7 inches thick, consisting of oxide of copper and cobalt. Hollow stones show that the copper was taken out in a nearly pure state; and the refuse constitutes an ore very rich in copper. A ton of refuse taken from various points in the mine yields 80 per cent of large lumps, 13.5 per cent of grains and 6.5 per cent of powder, producing on an average 15.5 per cent of copper and 1.5 per cent of cobalt, while numerous samples of the cobalt ore left in the mine show 32 per cent of cobalt.

THE financial plank adopted by the Democratic National Convention at Chicago last Thursday is as follows: "Recognizing that the money question is paramount to all others at this time, we invite attention to the fact that the Federal Constitution named silver and gold together as the money metals of the United States, and that the first coinage law passed by Congress under the Constitution made the silver dollar the monetary unit and admitted gold to free coinage at a ratio based upon the silver dollar unit. We declare that the act of 1873 demonetizing silver without the knowledge or approval of the American people has resulted in the appreciation of gold and a corresponding fall in the price of commodities produced by the people, a heavy increase in the burden of taxation and of all debts, public and private, the enrichment of the money lending class at home and abroad, the prostration of industry and impoverishing of the people. We are unalterably opposed to monometallism, which has locked fast the prosperity of an industrial people in the paralysis of hard times. Gold monometallism is a British policy, and its adoption has brought other nations into financial servitude to London. It is not only un-American, but anti-American, and it can be fastened on the United States only by the sinking of that spirit and love of liberty which proclaimed our political independence in 1776, and won it in the war of the Revolution. We demand the free and unlimited coinage of both gold and silver at the present legal ratio of 16 to 1 without waiting for the aid or consent of any other nation. We demand that the standard silver dollar shall be full legal tender equally with gold for all debts, public and private, and we favor such legislation as will prevent for the future the demonetization of any kind of legal tender money by private contract."

Status of the Miner, Past and Present.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

Germany was the first country in the Old World to give mining its proper place. The Germans looked upon and treated mining as a science and the miners were given a high and honorable position among the workers in the industries of the nation. The silver mines of Germany were discovered in the tenth century and have been worked ever since. Not only has the science of mining been brought to greater perfection in Germany than in any other country in Europe, but the miner there stands highe than in any other place in the Old World.

The British in the South African mines have about as good a thing in the way of cheap labor in the Kaffir as the Spaniard in America has always had in the Indian. The black man, however, is as yet rather more independent than the red one, laws not yet having been framed to place his neck in the yoke and make him work. Although he cannot be held at the mines by law, much to the regret of the big mine owners, the Kaffir is treated much the same as he would be were he a slave. He is fed on corn meal mush, like a beast of burden, and is herded and guarded in a "compound," which is a sort of modified slave-pen. The wages given him are a mere trifle, considering the hard work he is obliged to do in the deep levels of the big mines. The black men, however, with not be "expended" by the British in their mines, as the red men were by the Spaniards, unless a law can be passed which will hold him to his work as a serf if he gets in debt. The Kaffir works a certain length of time in the mines, when he quits and goes home to his corn and melon patch in spite of all that can be done at the mine to hold him. He still has notions of his own, though he will probably at no very distant day fall into the hands of the British and be worked by them as a machine for cheap production.

In India the British work the natives in the gold mines, paying them a few cents a day as wages. Both men and women are worked underground. The work of the women is harder than that done by the men. In regard to their work, John Williamson, of Deadwood, S. D., who spent six years in India as superintendent for an English company, says women are mostly worked in the shafts, where they take the place of hoisting apparatus, being cheaper than steam power. At one shaft Mr. Williamson had no fewer than 190 female workers, this force constituting two shifts. These women were stationed at a certain distance apart on a ladder in the shaft and passed the buckets containing the ore and waste from one to the other till it reached the surface. They pass the buckets very rapidly, though they are large and heavy.

The work of these women, who are obliged to stand all day on a ladder, is about as toilsome as that of the "apire" of Spanish America, who climbs the notched poles with a burro load of ore on his back. At all the mines in India this native labor, male and female, is employed when a mine is being prospected. Once a paying mine is found machinery is erected. The country, like Matabelaland, South Africa, is full of ancient mining work. Some of the old workings are many hundred feet in depth and extent. Often when cleaned out at the cost of much labor nothing of value is found in these old shafts.

In the United States, in the gold and silver mines of the Pacific Coast States, the miner stands on an equality in every respect with citizens engaged in other industrial pursuits. In no other country in the world is the working miner better situated and more independent than here and in no other country does he obtain as high wages. His home is as well and comfortably furnished as are those of other citizens of the same means; he has an abundance of good wholesome food; his family is as well dressed as those of his neighbors engaged in other industries, and his children are educated in the public schools along with the other children of the community. Indeed, instead of being looked upon as an occupation fit only for slaves and criminals, as of old, mining is being rapidly advanced to a high place among the sciences. It is to-day engaging the attention of many of the brightest minds in the country. In its various departments—mechanical, chemical, geological, metallurgical, etc.—there is room and a demand for the services of experts in at least half a dozen branches of scientific knowledge.

The industry of the miner of the precious metals is really the "father and mother" of all the other industries. It furnishes the motive power that sets in motion the wheels of all the other industries. In this country there is given the miner abundant opportunity to rise from the ranks. Men trained in our mines have been given high positions in every mining country in the world, and at princely salaries. The names of scores of Pacific coast experts in mining are famous the world over. Here mining has taken a new departure; it has been lifted out of the ruts of ignorance and slums of old superstitions and advanced to the position of a leading science. In all regions which produce the precious metals the American method of mining is being introduced and practiced. We send missionaries in the new school of mining to Mexico, South America, Australia, South Africa, India, China, Russia, Japan and many other countries where there are mines of gold and silver.

Our miners all have opportunities for acquiring handsome fortunes. Scores of our millionaires owe their wealth to mining, and many among them began as common working miners. This country is indeed the "happy hunting ground" of the miner and prospector. Among our miners of gold and silver the possibilities are great. A man who to-day cannot buy a sack of flour may be worth a million a month hence.

Our people have made the occupation of mining one that no man need be ashamed of; they have removed the stigma which attached to the industry in the Old World and raised it to a high and honorable position among the pursuits that engage the attention of civilized man.

The Old Prospector.

Written by DAN DE QUILLE.

Although many a good and kind word has been spoken of the prospector, yet full credit has seldom been given him for the important work he has performed in the way of advancing the development of the industry of mining the precious metals on the Pacific coast. Not a few look upon the prospector as a sort of shiftless, roving creature who wanders about the wilds of the mountains in a profitless way. But the fact is that the prospector occupies a very important place among the members of the mining industry. He is the pioneer and leads the way in the exploration of new mining fields, scouting out into the wilds far in advance of towns and settlements. Before mines can be opened and worked by capital they must be discovered, and it is the prospector who sallies forth and does the necessary work.

The prospector may be said to have been born in the days of "forty-nine" when the harvest of the gold of the California placers began. As soon as "born" the prospector began scouting out into the wilderness, and he has been at it ever since. "Once a prospector always a prospector." A working miner may at times do something in the way of prospecting, but the real prospector is one who is always dreaming of undiscovered veins of the precious metals in far away mountain regions and whose greatest delight is to roam and camp in new and unexplored fields. The prospector has in his composition something of the nature and disposition of the old hunter and trapper, and braves all manner of perils and endures a thousand hardships in pursuit of his favorite occupation.

In the opening up of the mining regions of the Pacific coast the prospector has everywhere been in the advance—led the way. He it was at the front who first met the arrows of the red men, battled with the wild beasts of the mountains, and encountered the dangers of waterless wastes. First the mining field is discovered, then the miners push forward and a camp is established which presently grows to be a town or city.

In Nevada, Idaho, Montana, Arizona, and almost everywhere else the prospector has been obliged to fight his way among savages, and in several sections of the Pacific coast mining regions he is still on the warpath in rugged mountain wilds. Although the prospector is always, by day and by night, dreaming of great wealth, he is seldom wealthy. He is a man of little means and when he finds a good mine he generally sells it at a price far below its real value.

The genuine prospector is not at all inclined to settle down to the hard every day toil required in the development of a mine. There is too much of the gypsy, or trapper and hunter, in his nature to permit of his permanently establishing himself in any particular spot. He has in his composition a romantic love of adventure and delights in the wild beauties of nature as he finds them in the far away fastnesses of the mountains. Besides he has dreams of wealth in many places. No sooner has he made a find and a little "raise" than he is off to explore some region of which he has long had golden visions.

Hundreds of these pioneers of mining, the prospectors, have left their bones on the deserts and in the mountains, and not a few have lost their scalps in battles with the savages. Still men are found on the trails of the mountains who are ready to brave the dangers of any region in which gold may be found from the burning sands of New Mexico to the ice-bound regions of Alaska. The true prospector always sees somewhere ahead a sort of paradise. There is a fine camping place, with plenty of wood and water, with grass for his burro in a natural meadow, and all else convenient. There, in this little miner's heaven, he places a wonderfully rich mine—a mine in which all is glittering with gold and silver. There are men who began prospecting forty years ago who are still meandering the mountain trails, though now old, wrinkled and white-haired. They are still after the big thing that is always a little way ahead.

If all do not find gold, every prospector finds more or less pleasure in his chosen pursuit, notwithstanding the hardships of the life. The prospector is generally a lover of nature and he enjoys the wilds. Reposing upon the bosom of mother earth at his campfire, he gazes into the starry heavens and takes pleasure in speculating in regard to what is in and upon the far-away twinkling and whirling worlds. He finds music in the voice of the winds in the pines and has an ear for all the night sounds of nature, the chirp of insects and the twitter of night-singing birds. Often, too, when the camp-fire has burned low, his quick ear detects the footfalls of some prowling wolf, fox, bear or other wild animal; but, with his trusty revolver under his pillow, he has no fear.

When parties of prospectors meet and camp together in the mountains, there is always a feast of golden legends. There are stories of lost leads, of rich leads that no one has ever been able to find, of float-rock filled with veins of gold and of immense nuggets picked up in various places. Every man has a story, and it is seldom a dull one. The old prospector is a man of a thousand adventures. He has had his Indian fights, his encounters with wild animals and his escapes from death by starvation and thirst; but all is at once forgotten when the word is that there is gold ahead. Then it is: "Pack the burros and away!"

The real old prospector—the man of the mountains—is a man worth knowing, and commands the respect of mining men in all the camps of the coast. As the old hunters and trappers were the avant-couriers of the westward advance of the industry of agriculture from the Atlantic seaboard to the Rocky mountains, so the prospector was the pioneer of civilization in the industry of mining. He blazed the trail to the mines; miners, machinists, merchants and men of capital then followed, and soon the wilderness was conquered.

The old prospector now sees busy towns, street cars and electric lights in a hundred places where in times past he camped and grazed his burro, and finds railroad trains rushing and roaring around mountains and through canyons, where once he painfully toiled in trackless wilds. Where he battled with the hostile savage, he now sees peaceful settlements and flourishing farms, and the laughing voices of children are heard where once the wild Indian raised his war whoop. The old prospector may have no great store of gold, but he has the satisfaction of seeing on all sides the spreading and firm rooting of the civilization for which he blazed the way.

No monument is likely to be raised to the memory of the old prospector when he crosses the dark river to the big camp on the golden shore; but in every Pacific coast State will stand to his credit the posts he planted at the front. His old camps will stand as monuments to mark his line of march and the scenes of his exploits and struggles in the wilds.

DAN DE QUILLE.

Virginia City, Nevada, July 1st, '96.

Young Sequoias.

Considering the fame of the big trees of California, it is a little surprising that ordinary tree planters in this State have not done more to distribute it more widely. Possibly they have been appalled at the ages required to make a tree like the best in our native groves in the Sierra Nevada, but probably they have passed by the plant because it is native and have given attention to foreign evergreens instead. Still there are very good sequoias here and there, but hardly more abundant here than they are in coniferous collections in the East and in Europe.

The engraving on this page shows what a group of young *sequoia gigantea* looks like, the view having been taken at the University Forestry Station near Chico. The trees at the time of photographing were about seven years old and were upwards of 17 feet high. The trees respond readily to good cultivation, for the report of the University Experiment Station, just issued, says that during the first few years after planting, the growth was slow because the ground was filled with Johnson grass roots which was cleared out when the land came under University control.

During the first summer after the cultivation began the trees grew seven feet in height, which must be considered very satisfactory and class the tree as a rapid grower. There are at the Chico station about 125 trees, of which the photograph shows but a few. The grove promises to be of great interest in the future, and records of its progress will be kept. At the Chico station there are many other interesting native and introduced trees, and the plantation will be extended and enriched as opportunity offers. Under Professor Hilgard, Mr. Charles H. Shinn has supervision of the forestry stations at Chico and Santa Monica, and he takes the keenest interest in their development.

PART OF THE YOUNG SEQUOIA GIGANTEA GROVE AT THE CHICO FORESTRY STATION.

Keeping Copper Plates Bright.

A correspondent of the *Review* writes as follows about trouble he is having with amalgamating plates in a stamp mill: "Our plates are covered with a green film, which does not apparently interfere with saving the gold. Some say it causes a loss of gold. Is it true? What is the cause of the green film and how can it be prevented?"

The greenish, or greenish gray, film forming on copper plates, often showing various colors, is due to the oxidation of copper in the amalgam; or it may be due partly to the effect of sulphates in the ore, in which case it would be at least partly a basic sulphate of copper. On good electro-silver plated copper plates we have never seen it. It certainly does cause a loss of gold in amalgamation. When it appears the stamps should be hung up and the coppers cleaned. This may be done with ammonia, a solution of caustic soda or potash, or a dilute solution of cyanide of potassium. After removal a little more quicksilver should be rubbed in. If it then appears it should be removed as before, all the amalgam scraped off and a good coating of silver amalgam rubbed in. Silver amalgam will prevent its reappearance.

If pure silver can be obtained it can be easily made by using about three parts of quicksilver to one of silver. It requires about one-fourth ounce of amalgam to each square foot of surface to be amalgamated. If pure silver cannot be obtained, a good way to make it is to use silver dollars. Dissolve them in a porcelain evaporating dish, or any chinaware dish if such be not at hand, in dilute nitric acid, and evaporate it to dryness, over hot water, or a water bath. Heat the dry mass gently till it fuses, and all the bluish tinge is changed to grayish black. When this point is reached the copper alloy in the silver coin will be changed to an insoluble oxide. Then dissolve all that will dissolve in a very little water, and filter into a glass jar. To this add the quicksilver required, and drop in a few bright nails or other iron. The

silver will be deposited as metallic silver and form amalgam with the quick, and in two or three days it will be complete and ready to use without other care.

It is a good idea to always use silver amalgam on the plates, rather than pure quicksilver, because it keeps the surface cleaner, and we believe, causes a better saving of the gold.

Knots and Splices in Manila Rope.

Some recent inquiries about the details of knots and splicing in ropes led to the belief that an illustrated article on that subject would be of practical interest. The best information on the subject that has recently come under our observation is contained in a pamphlet issued by the C. W. Hunt Co., 45 Broadway, N. Y., to whose courtesy we are indebted for the illustrations on the front page of this issue and much of the description.

To properly splice a rope or to tie a knot that will not slip, is quite an acquisition. The splice in a transmission rope is not only the weakest part of the rope but is the first to fail when the rope is worn out. If the splice is not strong the rope will fail by breakage or pulling out of the splice. If the rope is larger at the splice, the projecting parts will wear on the pulleys and the rope fail from the cutting off of the strands.

To profit by the experience of others, do not put in a "short splice" or an ordinary "long splice," or get an "old sailor" to do the work, but have some handy man follow the directions given herewith for a splice in a 4-strand rope.

Figures 1327, 1328, 1341 and 1342, on the front page of this issue, show each successive operation in splicing a 1¾ inch manila rope. Each engraving was made from a full size specimen and accurately shows the position of the parts. Tie a piece of twine 9 and 10, around the rope to be spliced about six feet from each end. Then unlay the strands of each end back to the twine. Butt the ropes together and twist each corresponding pair of strands loosely, to keep them from being tangled, as shown in engraving No. 1327.

The twine 10 is now cut, and the strand 8 unlaid and strand 7 carefully laid in its place for a distance of 4½ feet from the junction. The strand 6 is next unlaid about 1½ feet and strand 5 laid in its place. The ends of the cores are now cut off so they just meet. Unlay strand 1 four and a half feet, laying strand 2 in its place. Unlay strand 3 one and a half feet, laying in strand 4. Cut all the strands off to a length of about 20 inches, for convenience in manipulation.

The rope now assumes the form shown in Fig. 1328, with the meeting points of the strands 3 feet apart. Each pair of strands is successively subjected to the following operation: From the point of meeting of the strands 8 and 7, unlay each one three turns; split both the strand 8 and the strand 7 in halves as far back as they are now unlaid and the end of each half-strand "whipped" with a small piece of twine.

The half of the strand 7 is now laid in three turns and the half of 8 also laid in three turns. The half strands now meet and are tied in a simple knot, 11 (engraving No. 1341) making the rope at this point its original size. The rope is now opened with a marlin spike and the half-strand of 7 worked around the half-strand of 8 by passing the end of the half-strand 7 through the rope, as shown in the engraving, drawn taut and again worked around this half-strand until it reaches the half-strand 13 that was not laid in. This half-strand 13 is now split, and the half-strand 7 drawn through the opening thus made and then tucked under the two adjacent strands, as shown in cut No. 1342. The other half of the strand 8 is now wound around the other half-strand 7 in the same manner. After each pair of strands has been treated in this manner, the ends are cut off at 12, leaving them about 4 inches long. After a few days' wear, they will draw into the body of the rope or wear off, so that the locality of the splice can scarcely be detected.

The stretch of a transmission rope during its life is no greater in amount than that of a leather belt, yet it is a material amount, and when several ropes run side by side on a pair of pulleys, the different ropes are likely to wear unevenly, and some sag more than others—so much so, in some cases, as to materially increase, not only the wear of the ropes themselves, but to increase the friction loss in the transmission. The gradual lengthening of the rope in service may decrease the tension until the rope slips on the pulley, making it necessary either to resplice the rope or to use a take-up sheave with a long range of motion.

This difficulty, however, can be completely obviated by the use of the rope coupling shown in cut No. 95,130. This coupling is smaller than the rope, so that it does not touch the pulleys. It is made in two parts, which are secured together when the rope is put on the pulleys, containing an inside ratchet, by which the two parts can be rotated and locked in any desired position. When the rope has stretched any perceptible amount, the two parts of the coupling are turned in opposite directions, putting more "turns" in the rope, thus shortening it any desired amount. In this manner all the ropes of a multiple drive can be kept at the same tension with the greatest exactness.

A great number of knots have been devised of which a few only are illustrated, but those selected are the most frequently used. In the engravings they are shown open, or before being drawn taut, in order to show the position of the parts. The names usually given to them are: A, Bight of a rope; B, Simple or overhand knot; C, Figure 8 knot; D, Double knot; E, Boat knot; F, Bowline, first step; G, Bowline, second step; H, Bowline completed; I, Square of reef knot; J, Sheet bend or weaver's knot; K, Sheet bend with a toggle; L, Carrick bend; M, Stevedore knot completed; N, Stevedore knot commenced; O, Half-hitch; P, Timber-hitch; Q, Clove-hitch; R, Rolling-hitch; S, Timber-hitch and half-hitch; T, Slip knot; U, Flemish loop; V, Chain knot with toggle; W, Blackwall-hitch; X, Fishermen's bend; Y, Round turn and half-hitch; Z, Wall knot commenced; AA, Wall knot completed; BB, Wall knot crown commenced; CC, Wall knot crown completed.

The principle of a knot is that no two parts, which would move in the same direction if the rope were to slip, should lay alongside of and touching each other.

The bowline is one of the most useful knots; it will not slip, and after being strained is easily untied. It should be tied with facility by everyone who handles rope. Commence by making a bight in the rope, then put the end through the bight and under the standing part as shown in G, then pass the end again through the bight, and haul tight.

The square or reef knot must not be mistaken for a "granny" knot that slips under a strain. Knots H, K and M are easily untied after being under strain. The knot M is useful when the rope passes through an eye and is held by the knot, as it will not slip and is easily untied after being strained.

The timber-hitch, S, looks as though it would give way, but it will not; the greater the strain the tighter it will hold. The wall knot looks complicated, but is easily made by proceeding as follows: Form a bight with strand 1 and pass the strand 2 around the end of it, and the strand 3 around the end of 2 and then through the bight of 1 as shown in the engraving Z. Haul the ends taut when the appearance is as shown in the engraving AA. The end of the strand 1 is now laid over the center of the knot, strand 2 laid over 1 and 3 over 2, when the end of 3 is passed through the bight of 1 as shown in the engraving BB. Haul all the strands taut as shown in the engraving CC.

The treatise referred to on ropes used for the transmission of power contains formulæ, tables and data useful in engineering, and is of practical value. Those interested in the matter would do well to send for the pamphlet to the above address.

Electrical Progress.

Electricity Direct From Coal.

In the July number of the *Engineering Magazine*, discussing the direct production of electricity from coal, and Dr. Jacques' promise of a revolution in power production, G. H. Stockbridge says Dr. Jacques began his investigations some five or six years ago, and in 1891 he prosecuted a series of experiments which demonstrated the practicability of his electric furnace. By Dr. Jacques' own account, his invention is based on the discovery "that, if oxygen, whether pure or diluted, as in air, be caused to combine with carbon or carbonaceous materials, not directly, as in the case of combustion, but through an intervening electrolyte, the potential energy of the carbon may be converted directly into electrical energy, instead of into heat." Practically, Dr. Jacques supplies the active or oxidizing element of his generating cell with an excess of oxygen by means of an artificial air-blast. The electrolyte, whose first action after the cell is set up is to release its oxygen and so permit it to attack the carbon, is thus continuously renewed by fresh charges of oxygen, which are at once carried to the carbon for a continued attack. The carbon is consumed, and electrical energy is developed in a corresponding degree, the rate of consumption and the strength of the electric current being gauged by the rapidity with which air is supplied to the electrolytic compound.

The generating apparatus consists of a pot of pure iron surrounded by a suitable furnace containing caustic soda (sodium hydrate), into which extends a rod or cylinder of carbon. Naturally the carbon must be in such a state that it may serve as a good electrical conductor. Gas carbon and charcoal are available without special treatment, but anthracite coal has to be baked to give it the requisite conductivity, and bituminous coal needs, for the same purpose, to have some of its hydrocarbons driven off. Commercial caustic soda can be used without expelling the usual impurities.

In addition to the foregoing elements of the generator, Jacques provides an air-pump for forcing into the sodium hydrate an excess of oxygen, the air containing the oxygen being carried to a "rose" for distributing the air currents through the electrolyte in fine sprays. The rose is made of a metal not acted upon by the hydrate. The whole being supplied with a suitable insulating cover having a proper vent, the apparatus can be set in operation by bringing the furnace and its inclosed generator and electrolyte to a temperature of 400° to 500° Centrigrade, and operating the air pump. By virtue of the violent ebullition caused by the jets of air, every part of the electrolyte is brought into contact with the air, from which it takes up oxygen in excess; after which it is carried against the carbon and releases the oxygen collected in its travels. The carbon is attacked by the oxygen and suffers a gradual consumption as long as the operation continues.

It is found that the electrolyte needs renewing at intervals, by reason of its slow contamination by carbonate of soda, resulting from the union of some of the caustic soda with carbonic acid developed in the generating process or coming from the injected air. Moreover, the ash from the carbon tends to lessen the efficiency of the electrolyte. But, if a small percentage of oxide of magnesium be added to the electrolyte, its renewal may be sensibly postponed. According to Dr. Jacques, the oxide of magnesium serves as a carrier to convey the carbonic acid through the electrolyte. His conception of the action of the oxide of magnesium is that free carbonic acid combines with it in preference to the caustic soda, and that the carbonate of magnesium so formed is quickly decomposed into carbonic acid, which escapes, and oxide of magnesium, which is again ready to repeat its action. In any case, that part of the carbonic acid which causes contamination is very small, the most of it bubbling up through the caustic soda and escaping into air.

Respecting the oxidizing agent, Dr. Jacques says: "There are many electrolytes that may be used in practising my invention. Following are some of the desirable characteristics: They should become liquid at a convenient temperature. They should possess good electrolytic conductivity. They should be capable of readily taking up oxygen from the air or other source of supply, and also capable of readily giving up oxygen into combination with the carbon. They should not have a strong affinity for carbonic acid, and, in case air is used as a source of oxygen supply, should not have any considerable affinity for the nitrogen or other substances with which the oxygen of the air is diluted. The molten hydrates of potash and soda are especially suitable for practical use." The use of pure iron for the collecting electrode is recommended as generally applicable and inexpensive; but steel and iron containing a considerable amount of carbon are to be avoided. The sodium hydrate, when melted, has no sensible chemical action upon the iron, which, therefore, remains substantially unchanged.

Briefly, the process employed by Jacques consists in chemically combining oxygen with carbon by impregnating a molten basic electrolyte, which is in contact with the carbon, with oxygen or air, and collecting the electricity thereby developed by means of an electrode not acted on by the impregnated electrolyte when the circuit is completed. To render the process continuous, a sufficient heat is maintained by means of a suitable furnace, and the air-pump is kept in operation. Incidentally, the bubbling of the air through the heated electrolytic compound contributes to securing and preserving a uniformly distributed heat, which is, of course, to be desired.

Uses of Electricity in Metallurgy.

Before smelting, many ores have to be submitted to processes of preparation, and it is found that even in these preliminary operations electricity is of service. The magnetic and non-magnetic portions of a mixture can be separated by electro-magnetic contrivances, of which 270 have already been patented in the United States. Electro-magnetic preparation has been applied chiefly to ores of iron, lead and zinc. We first come to those under the head of reduction of oxides by heat; in these cases, however, electricity is only employed as a means of producing a high temperature. But it is important to notice that all oxides (naturally with the exception of carbon monoxide) can be reduced by this method in presence of carbon. The Cowles process of manufacturing aluminum bronze was the first important application of this principle. The *Iron World* shows that chromium, manganese and tungsten can be produced in the same way, although chromium and tungsten have a very high melting point. In the chemical decomposition of sulphides and salts, electrical methods have found no applications; but after this we come to processes which are entirely electrical. It will suffice to point out that the only metals not included in the columns for electrolysis of aqueous solutions and fused compounds are iron, mercury and tungsten. Even these can be prepared electrolytically, but as yet the electrical methods have not been able to compete with the others. Among present applications of electrolysis may be mentioned the refining of metals and the manufacture of metallic objects (Elmore, Klein), the reduction of aluminum, the separation of gold and silver, the extraction of gold by the cyanide process and electrolysis, electro-deposition of zinc, etc. Hitherto electricity has played but a small part in the great iron industry, but strenuous efforts are being made

to apply it both in the preparation of the raw material and in the subsequent processes of manufacture.

R. P. WILLIAMS describes a process originated by A. B. Brown for the electrolytic production of white lead. It consists in decomposing, by an electric current, a solution of sodium nitrate containing about one pound to the gallon, in wood cells provided with porous diaphragms; the nitric acid radical attacks the positive electrode, which is of metallic lead, and the lead nitrate solution thus formed is precipitated later by the sodium hydrate produced at the other electrode. The precipitated lead hydroxide is digested with bicarbonate of soda solution, whereby lead carbonate in a very fine state of division is obtained. The sodium nitrate is thereby regenerated. The sodium bicarbonate used is formed by passing carbon dioxide into the caustic soda solution. It is claimed that the process can be made a commercial success, the white lead being equal or superior to that made by the old "Dutch process." The plant required is small for a considerable output, and there is no loss of time, the reactions taking place rapidly. There is a great saving in labor and materials. The product of the electrolytic process is in a very fine state of division, and is claimed to be of a spongy character, non-crystalline, and having great covering power.

Scientific Progress.

Mysteries in Science.

What we do know is so little in comparison with that which baffles us, that the pride of man is humbled when he contemplates the fact. Here before us is a white pine tree in which the leading shoot that forms the trunk ultimately goes so straight upwardly that a plumb line can show no deviation from the perpendicular, while the lateral branches push out at a right angle with the stem. The power which directs these different directions is wholly unknown, and then note how this direction varies in different trees. While the leader in a Norway spruce is directed as truly perpendicular as the white pine, the lateral branches are at an acute angle—and the angle of nearly the same degree in all the individuals of the species. If we then compare the angular divergence with other species, we find that most have a plan of their own, which is followed through all the individuals of the species,—nearly all, for "never" is a word unknown to nature.

Of the atmosphere around us we know scarcely nothing. In other eyes than ours it would look like a huge aquarium in which myriads of forms of plants and animals are floating, while man would look like a little streak of black sand strewn along the bottom. Even the elements of which this atmospheric sea is composed are in a measure unknown, judging by discoveries continually made. We had thought we knew, and that oxygen, hydrogen, nitrogen and carbonic acid gases alone constructed it—but now we have found another, which has been named argon. Once we had concluded that hydrogen was the mother of all the other gases. It looks as if argon was, in the new light, but then even argon may have to go.—Thomas Meehan.

Mountain Ranges.

The origin of what is termed the "American theory" of the formation of mountain ranges is largely due to Prof. le Conte of Berkeley, at the State University. It is known as the contraction theory, which assumes that the earth was once an incandescent ball, now cooling, a coolness which compels yielding along its lines of weakness. An interesting investigation of the phenomenon of mountains has led to the opinion that they are born of sea margin deposits, observation showing that existing off-shore deposits are coarse at the top shading down to that which is fine by the same law as that marked in the structure of mountains, but the enormous mountainous deposits would, it is argued, have been possible only where there was a corresponding subsidence of sea bottom.

That the earth sinks by loading and rises by unloading is illustrated by the Colorado plateau. Originally 20,000 feet high, 12,000 feet have been removed by erosion, which has caused the remaining 8,000 feet to rise above the general level. It is claimed to be proved that the cosmic behavior of the earth is that of a rigid solid—that as a solid globe of glass 6 feet in diameter will change shape by the pressure of its own weight the earth does the same. The earth, however, not being homogeneous, accounts for its radical contraction being in ridges.

IN several industrial pursuits in which metal and glass are ground on a wheel, and the air about the workman is filled with dust, health is often impaired and life is shortened by inhaling these irritating particles. Among the various devices proposed and tried for meeting this evil is a mask, to be worn over the workman's face and provided with a sort of strainer, through which all air must pass on the way to his lungs. Recently a prize was awarded by the French "Society for the Prevention of Accidents in Industrial Pursuits" for the best form of respirator produced to Dr. Detourbe, whose design has now been adopted in a number of workshops in northern France. The mask is so shaped as to fit the lower half of the face closely, but not to interfere with the wearer's vision. A chamber in the middle, through which the air is filtered and which projects only a slight distance from the rest of the mask, contains a layer of asbestos and also one of cotton or wool, arranged between small plates of aluminum gauze. The mask is of copper, and a strip of elastic felt runs around its inner surface near the edge, thus insuring a good contact all around. The device is held on with light elastic bands encircling the head, one on a level with the forehead and the other about opposite the lower lip. The orifice is so large, and the lining of the chamber so loosely packed, that the wearer can breathe and can talk without difficulty.

C. W. HERSHEL, a Nova Scotia whaler, says he is going to place a dynamo on his ship. "On board I will have a big reel of heavily insulated wire. The reel will be placed in the smaller boat, in which we go out to meet the whale. We shall have several thousand feet of wire on the reel. One end will be connected with the dynamo. At the other end, which will be in the smaller boat, will be a hard rubber stick, about four feet in length. The wire will run through that stick so that it may be handled easily and safely. At the end of the stick will be attached a piece of metal 24 inches long and one inch in diameter. The point of the needle will be sharp, so as to penetrate the flesh of the whale easily. The hard rubber stick and the big needle will be used just as we use the harpoon to-day. When near the big fish, as near as we get in the old way, the harpooner will throw the electric barb. At the time there will be a current of 10,000 volts running through the wire. When the point of the needle strikes the whale a current connection will be formed with the dynamo, and the whale will get the full shock of the high voltage and be dead in the fraction of a second." It sounds all right, but he may have difficulty in the continuity of the current.

THE new highway is a gutter steel track one-fourth of an inch thick, five inches wide, flat on the bottom, with sides half an inch high, then extending outward 1½ inches, then down 1½ inches. It is spiked to a longitudinal timber laid on cross ties. No spike heads are on the surface, and the track is perfectly smooth. The track is laid 4 feet 8½ inches from center to center—the standard gauge of all wagons and railroad cars." The middle and sides are filled in with stone—in fact, is a macadamized road with steel tracks for the wagon wheels. On this steel track one horse will draw 20 times as much as on a dirt road. Freight can be hauled on a steel track road for less than half average charge on lateral roads. This means an economic revolution. The practice of all trunk lines, in the language of one of the highest railroad officials in the nation, is to charge "all that the traffic will bear," to meet the fierce competition of rival routes to the seaboard, and the freight along lateral roads is charged enough more to make on the whole a satisfactory profit. This robbery by the trunk lines, who control all lateral feeders, has been carried to such lengths that freight to and from distances of 1,000 miles is carried to and from market at less per ton than is charged on lateral roads for 100 miles.

Mechanical Progress.

Air Hoist Table.

Herewith is prepared a table of the lifting capacities of direct acting air hoists, with volume of free air per lift, and cost of air per single lift and 100 lifts, with a maximum lift of 4 feet, and a minimum pressure of 90 lbs air furnished at 5 cents per 1000 cubic feet of free air:

Diameter of cylinder.....	Effective area of piston.....	Maximum weight lifted.....	Cu. ft. free air for 4 ft. of lift.	Cost of air per lift.....	Cost of air per 100 lifts.....
2	3.05	274	.74	$0.000037	$0.0037
3	6.87	619	1.67	.000094	.0084
4	12.22	1,099	2.97	.000149	.0149
5	19.09	1,718	4.64	.000232	.0232
6	27.49	2,474	6.68	.000334	.0334
7	37.42	3,367	9.09	.000455	.0455
8	48.87	4,398	11.88	.000594	.0594
9	61.85	5,566	15.03	.000752	.0752
10	76.36	6,872	18.56	.000928	.0928
11	92.39	8,315	22.46	.001123	.1123
12	109.96	9,896	26.73	.001337	.1337

Air used in combination with a low pressure hydraulic system gives the best results for heavy loads. By interposing the water between the elastic medium air and the load we eliminate that element of danger which otherwise would be present in handling vessels of molten metal, as in foundry practice, and also obtain a sort of elastic positiveness which is so essential and desirable. In the actual work of molding, as in lifting copes and molds, drawing patterns and moving cores, the men are enabled to do about 50 per cent more work and do it easier and better when equipped with a hydro-pneumatic hoist. Included in this percentage is the saving in repairs and the danger of losing castings. These hoists more nearly approach the old-fashioned hemp rope cranes in their elasticity as the compressed air behind the water seems to impart this peculiar quality.

THE Boston & Montana Consolidated Copper and Silver Mining Company, Great Falls, Mont., is installing about as large and powerful a pair of horizontal turbines, under the head they will operate, as have ever been turned out in this country. The turbines are 57 inches diameter, and, under the average head they will work, will develop 3258 H. P. They are placed on a cast-iron draft chest and discharge centrally through a draft tube; are surrounded by an iron flume 14 feet 6 inches in diameter and 32 feet 6 inches long. The whole is mounted on double I-beams on each side 20 inches deep, 28 feet long, with four cross I-beams. The iron shaft is 10 inches in diameter, 42 feet 2 inches long, weighing five tons. There are stands outside of the flume at each end which support the shaft. Each of these stands weighs 8000 pounds, on which is placed babbitt-lined journal boxes, in which the shaft revolves. The two turbines and outfits complete weigh 250,000 pounds. These operate two electric generators, one coupled directly to each end of the shaft, which will run 144 to 160 revolutions per minute, and will be used for smelting. The varying revolutions are required in order to increase or diminish the blast as conditions may require.

Fly-Wheel Calculations.

It is frequently desirable to ascertain whether a certain fly-wheel is heavy enough for its work. A practicable off-hand method of ascertaining this point is to divide the constant 5,000,000 or 6,000,000, according to the speed of the wheel, by its diameter; that is, if a wheel is running very fast, use the constant 5,000,000; if it is running slow, use the constant 6,000,000. After dividing by diameter of the wheel, divide it again by the square of the number of revolutions per minute. The quotient will be the number of pounds weight of rim required in each horse-power, and from these data the size of the wheel necessary can be readily calculated.—Tradesman.

Blasting Under Water,

In some blasting operations for removing submarine rocks lately carried out at Emmerich, on the Rhine, black powder was employed in water-tight cases, fired by safety fuse. The great difficulty occurred in tamping the shots under water; but this was at length successfully accomplished by running into the hole over the charge, by means of a funnel, quick-setting cement in a liquid state. The tamping, from 1½ to 2 meters long, was effected by means of tubular drifts, like gas pipes, toothed on their lower edge.—American Manufacturer.

THE British torpedo destroyer, H. M. S. Desperate, on a recent trial trip with the standard load on board, showed a mean speed of 30.46 knots, or 35 miles an hour, with 5600 horse-power, 210 pounds pressure, 24 inches vacuum, 406 revolutions. The Lucania would make 50 of her, but she has one-sixth of the Lucania's power, although with 50 per cent more speed. She would cross the Atlantic in a little over four days. She is 210 feet over all, with a beam of 19 feet 6 inches, and a depth of 13 feet 6 inches. The government of Great Britian has ordered 42 vessels of the kind.

A new method of preparing alloys was recently described in an interesting paper, read at the Academie des Sciences by M. Moissan. M. Moissan obtains alloys of refractory metals by projecting a mixture of the oxide with powdered aluminum into a bath of liquid aluminum. It is found that the heat set free by the oxidation of the aluminum is sufficient to carry on the reaction. In this manner alloys of aluminum with nickel, molybdenum, tungsten, uranium, and tinanium have been obtained.—Industries and Iron.

AN excellent property of aluminum is its sonorousness. Accordingly to Faraday's experiments the sound of an aluminum bar is not limited to a single tone, with its corresponding upper tones, but there are two different tones audible, one in the longitudinal and one in the transverse direction. This may be easily observed by hanging a bar on a thread and holding it near the ear whilst striking it.—Electricity.

To distinguish between iron and steel tools, quickly place the tool upon a stone and drop upon it some diluted nitric acid (four parts of water to one of acid). If the tool remains clear, it is of iron; if of steel, it will show a black spot where touched with the acid. These spots can be easily rubbed off.

THE metals now known to be capable of combining with argon at a red heat include magnesium, lithium, barium, aluminum, zinc, iron and copper. Barium rapidly absorbs nitrogen, and its use has been suggested as a ready means of separating argon from air.

Practical Information.

Nervous Strain of Railway Work.

There is reason to believe, says the *Medical Journal*, that at all times there are men on the line who are working very near to their breaking strain. We may in regard to this mention three well-known instances which, at the least, show the tension under which work is often carried on. A station master, seeing a man run over on the line, himself fell down dead upon the platform. Here was a shock which permanently made his heart stand still; but how many times had not that man's heart stood still before? We may feel perfectly certain that if the major shock could kill, the minor daily recurring shocks of a railway life must have greatly damaged a heart so under the influence of the nervous system. Two trains collided at a junction. It was either the fault of the drivers or of the rails, certainly not of the signal man. The signals were not right; yet when the box was entered the signal man was found to have gone mad, and had to be taken to the asylum, where he remained for long. He was broken utterly by the horror of the dilemma; but what shall we say about the smaller dilemmas which every hour of his working life he had had to solve? Did they not also have an effect, although a lesser one, upon his brain? A few years ago it was found that the sickness rate among the signal men of certain lines was becoming excessive, and it was determined to do away with the system of leaving to one man the whole responsibility of taking charge of a signal box. At great expense every box along the line was supplied with two men. Great evils were prophesied; it was thought the men would talk and lark and neglect their duties. This did not happen, but the sickness stopped. Under the shared responsibility they no longer broke down. If, then, as seems to be indubitable, railway "strain" can have definitely injurious effects upon the nervous system, it becomes an important question for inquiry whether this nervous derangement at all frequently has the effect of impairing the nutrition of heart.

Why Stone Walls are Damp.

The walls of a stone house and sometimes of a brick house, are covered with dampness. This is due to the very same causes by which dew is deposited on grasses or moisture on the side of a glass or pitcher that is filled with ice water and brought into a warm room. The walls become cold, and as stone is a nonconductor of heat, they remain cold for a long time. When the weather changes suddenly from cold to warm, the air becomes filled with moisture, for the warmer the air is the more moisture it will absorb. When this warm air strikes the cold walls the moisture is deposited on it from the air, which is suddenly cooled by contact with them, and as the warm air is continually coming in contact with the cold walls, the dampness accumulates until it appears like dew upon them, and pours down in streams at times. It is easily prevented. No plaster should be put directly upon brick or stone but furring strips should be nailed to the wall and the laths put on these. Cellars are frequently made very damp in the same way by too much ventilation in warm weather.

A MEDICAL AUTHORITY says celery is a cure for rheumatism, and asserts that the disease is impossible if the vegetable be cooked and freely eaten. The fact that it is almost always put on the table raw prevents its therapeutic powers from becoming known. The celery should be cut into bits, boiled in water until soft, and the water drunk by the patient. Put new milk, with a little flour and nutmeg, into a saucepan with the boiled celery, serve it warm with pieces of toast, eat it with potatoes, and the painful ailment will soon yield. Such is the declaration of a physician who claims to have tried the experiment with uniform success. He adds that cold or damp never produces, but simply develops, the disease, of which acid blood is the primary and sustaining cause, and that while the blood is alkaline there can be neither rheumatism or gout. English statistics show that in one year (1876) 3640 persons died of rheumatism, and every case, it is claimed, might have been cured or prevented by the adoption of the remedy mentioned. At least two-thirds of the cases named heart disease are ascribed to rheumatism and its agonizing ally, gout.

IN every commercial transaction involving any semblance to a contract, it is always best to have a definite understanding between the parties, and, if possible, that understanding should be in black and white. He who borrows even $5 should insist on giving a note therefor, and the lender ought not to refuse it. As far as possible, payments should be made in bank checks, and receipts invariably given and required. In extending credit it is especially necessary that a day of settlement should be fixed, and that the debtor, as well as his creditor, should understand that the designated day is to be a day of settlement. No one should enter the employ of another, nor should anyone receive service, until the question of remuneration has been definitely decided. In business it does not do to take things for granted. People are very likely to form different ideas of the meaning of a verbal agreement, and any man's memory is treacherous at times. If men would only insist upon understanding the contracts between them as they were made, there would be no necessity of appealing to the law for an interpretation. No one knows how much litigation, and loss, and disbonesty, and trouble, would be obviated if business people strictly adhered to the rule of undertaking no obligation without first arriving at a mutual conclusion as to the exact limits of that obligation.

ONE feels chilly when lying down because nature takes that time to give the heart rest, and that organ consequently makes ten strokes less a minute than when one is in an upright posture. Multiply that by sixty minutes, and it is six hundred strokes. Therefore in eight hours spent in lying down the heart is saved nearly five thousand strokes, and as the heart pumps six ounces of blood with each stroke it lifts thirty thousand ounces less of blood in a night of eight hours spent in bed than when one is in an upright position. As the blood flows so much more slowly through the veins when one is lying down, one must supply then with extra coverings the warmth usually furnished by circulation.—Harper's Bazar.

THE cracking of rubber goods is believed to be caused by the oxidation of the caoutchin, the essential oil of caoutchouc. Vulcanization does not lessen the affinity of this substance for oxygen. The compounds used tend to fill the pores of the rubber and thus somewhat reduce the opportunity for oxidation, but the metallic oxide and other substances introduced in vulcanization and dyeing—including sulphuric acid from antimony sulphide—are often injurious and boiling in caustic soda to remove the "bloom" left on goods by an excess of sulphur may cause injury. A comparison of analyses of the damaged rubber with those of the sound shows very large increase in the percentage of oxygen and some loss of carbon and sulphur.

"A STRIKING ILLUSTRATION of the influence of fatigue upon the nervous system," says *Modern Medicine*, "is afforded by an experiment conducted by an Italian physician some months ago. Twenty-four bicycle riders, who had ridden 32 miles in two hours and a quarter were examined with reference to their hearing, and it was in nearly every instance found to be defective. After two hours' rest the hearing had become normal in most of them."

CALIFORNIA MINES AND MINERS.*

PATENT SOLICITORS.

ESTABLISHED 1863

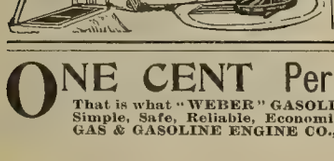
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

THE CHEAPEST PLACE ON EARTH TO OUTFIT A MINE

—IS AT—

THE J. H. MONTGOMERY MACHINERY CO., 1220-22 Curtis Street, Denver, Colo., U. S. A.

Just Listen—Reliable Common Sense Steel Whim, price reduced to $100. Steam Hoisters, $300 and up; hand hoisters $30; steel ore buckets all prices; prospectors' stamp mills $300. A 10-stamp mill, new, 850 lb. stamps, high mortars, latest improved. Only $800.



Ores tested and amalgamation and concentration mills built to **fit the ore** and guaranteed to save what we say. Coal Mine equipments, Screens, Jigs, Tramways, Arastors, Chilian Mills, Ore Sacks, etc. Cornish Rolls, 12x20, weight 6,000 lbs., price $350; Feeders, Bumping Tables; Blake Crushers, 7x10, weight 8,100 lbs, only $250. Our 100 page illustrated catalogue FREE.

MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

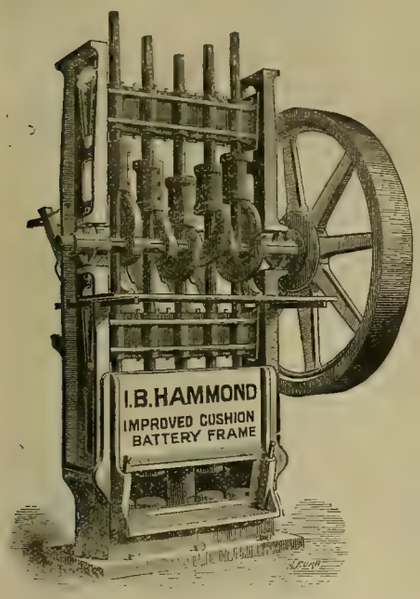
MANUFACTURERS OF

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.



Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight, About 5000 Pounds.

It requires no belting, shafting, pulleys or building.

Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.

Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

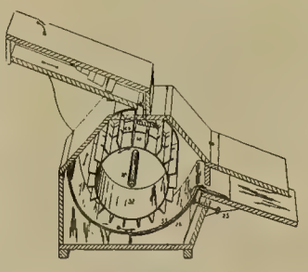
VICTOR AMALGAMATOR

(PATENTED.)

FOR MILL OR PLACER USE.



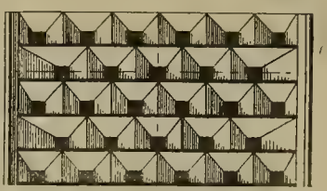
Greatest GOLD-SAVING MACHINE Ever Invented.

It will come nearer saving every color of free gold than any gold-saving device made up to the present time. Whether the gold is fine, flake or flour, its work is perfect. The only machine that works the black sands of the ocean perfectly, saving the fine flake gold contained therein. Our machines are now running on beach sand and on tailings from some of the best mills in California, and they are working successfully. We give guarantee with each machine. In working over old tailings from a stamp mill that contains free gold, amalgam and quicksilver, this machine has no equal. Send for catalogue and particulars. Manufactured only by the **VICTOR AMALGAMATOR CO., 705 S. Main St., Los Angeles, Cal.**

PAYNE'S

PATENTED

GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

Mining Summary.

CALIFORNIA.

Amador.

A 10-stamp mill was purchased last week for the Good Hope mine at Jackson. The shaft has been retimbered and enlarged and will be sunk to 600 feet and tunnels run north and south.

At the South Eureka at Sutter creek development work is being pushed. Of a total of 60 men on the pay roll 26 are on development work. The present ore supply for the mill comes from the 900 and 1050 levels. An upraise of 200 feet has been made in the ore shoot from the 900-foot level. On the 600-foot level the main drift is being advanced southeast to cut the ore body encountered on the 900-foot level. The 1250-foot station has been completed and a crosscut and drift started toward the shoot estimated to be something less than 850 feet distant.

Butte.

(Special Correspondence). — The Catskill (drift) gravel mine, one mile north of Bangor, owned by C. S. Bareford, was worked till Feb., '96, by 30 to 50 men, through a shaft down 200 feet. Water drove them out. The Groves gravel mine joins the Catskill on southwest.

The Derbec G. M. Co. own 40 acres of this channel 3 miles west of Bangor. It is thought they will purchase the entire blue lead of this section, and then proceed to mine on an extensive scale by running a tunnel in on bedrock at the Rocky Honcut.

At the Gold Bank mine, the most prominent at Forbestown, owned by H. P. Stow & Co., H. P. Stow is superintendent and L. D. Johnson is assistant superintendent. This property consists of four patented claims, the Gold Bank, Pine Grove, Mammoth and Church. The ore body of the whole runs east and west, and pitches north between a foot wall of greenstone and a diabase hanging wall. It averages 12 feet, all of which pays to work. The improvements on this property consist of hoisting works, a 40-stamp mill with 16 concentrators, 2 canvass plants, chlorination works and air compressor, all run by water power, of which they have an abundance. The development consists of 6 tunnels and 1 shaft down 360 feet on the incline of the vein. They are at present working 150 men in mine and mill, and extract and crush about 143 tons of rock every 24 hours. This is one of the best ventilated mines in the State. In 9 years working no accident has occurred to life or limb. The same water that runs the hoist and mill is again picked up and used to run the compressor. They are now engaged in running a hard rock crosscut tunnel, which, when completed, will tap the ledge at 500 feet vertical below the present workings. It is now in 1600 feet, and they are momentarily expecting to strike the ore body, in which event they will move their mill and other buildings necessary below the mouth of this tunnel.

At the Denver mine, owned by H. H. Noble of San Francisco, 3 miles northwest of Forbestown, Jos. Floyd is superintendent; working 16 men, mining and milling 25 tons of ore daily. The rock is classed as low grade but pays.

The Shakespeare mine, located adjoining Forbestown, owned by C. J. Nickerson & Co., is idle at present. The Golden Queen mine, adjoining the above, owned by C. J. Nickerson & Co., is temporarily idle in anticipation of its changing hands. In case of its not being sold the present owners will resume active work.

The Burlington consolidated mine, a newly organized company, owned by R. R. Grayson & Co., and located in the same vicinity, will probably do some extensive development work soon. The Carlisle mine, 2 miles from Forbestown, on the Feather river, owned by Carlisle & Grayson, is at present idle, but is soon to resume.

The Good Hope mine, Lincoln mining district, near Enterprise, 5 miles from Forbestown, on Macabees creek, is owned and managed by D. Burroughs. It consists of a 5-foot ledge running east and west, and stands nearly vertical. They have a hoist run by water. The mine is being developed through a shaft now down 50 feet. L. P. Mc.

Register: W. McMillan will put four men on the Resumption quartz mine at Hurleton to get out ore.

The old Mount Hope quartz mine, above Forbestown, has been bonded by a Chicago company and seven men have been set to work on it. They are running a drain tunnel at present.

The Magalia drift mine at present is working but few men, owing to the fact that the water which is being pumped from the old works was tapped about ten days ago.

G. F. Ditzler and several others are preparing to open up a new mine in South Thermalito, about a quarter of a mile above the Treat mine.

Calaveras.

Record: The machinery for the South Paloma mine has arrived and will soon be put in place. The shaft is down 160 feet, and when the hoisting machinery is finished sinking will be continued to the depth of 600 feet before any drifting will be done. The ore body is 5 to 12 feet wide, showing well in sulphurets.

At present everything at the Gwin mine is at a standstill, on account of the supply of water having been cut off because of a broken flume some distance in the mountains.

Active operations have been resumed on the Three B gravel mine on the Calaveras river. The necessary machinery for obtaining power from the river is now being put in, and a mill for crushing the gravel, which is cemented, is to be erected.

Mountain Echo: Hamilton & Hackney are preparing to open up their mine, situated immediately south of the Cherokee mine, in Altaville mining district. In a few days the machinery will be put in position and the work of sinking the shaft will be commenced.

A rich strike is reported at the Thorpe mine on the 500-foot level.

The Goat Ranch mine in Angels mining district is making quite a showing. The shaft is now 80 feet in depth and a 3-foot vein discovered.

El Dorado.

(Special Correspondence).—The Blanchard has reached a depth of 50 feet on a 7-foot ledge of good ore. The new steam hoist is in operation.

Notices for contract work in the development of new properties are becoming quite numerous in this locality.

Additional steam machinery for power is being placed this week on the Larkin. The double compartment shaft has reached 250 feet.

J. C. Shephard is sinking a shaft on the Mule mine 2½ miles northeast of Greenwood. The shaft is down 30 feet on a 9-foot ledge.

The Eagle King, near Grizzly Flats, at 250 feet has a 3-foot ledge of high-grade ore. A 10-stamp mill is in operation.

John Smith has 3000 feet known as the Aultruan mine, 2½ miles east of Greenwood, on which he has a tunnel 500 foot long, crosscutting the ledge at a depth of 250 feet. The ledge is said to be 40 feet wide on top running to a width of 100 feet in low-grade ore.

Placerville, July 6, 1896.

Humboldt.

Blue Lakes *Advocate:* The Sugar Bowl Mining Co. has completed its ditch, two and one-half miles long, to their mine on the Trinity river, near the Hoopa reservation. The water will be brought to the claim from Campbell creek.

Inyo.

Inyo *Register:* The Hanchett Co. is working twenty-four men in the Soldier Boy mine at Silver Peak, and has sent to Austin for about twenty more. With an increased number of miners the mill can be kept running two-thirds of the time. The stamps are dropping at present.

Kern.

Porterville *Enterprise:* Murry, Putnam and Hayes had been prospecting near Lander's mill on the Mojave desert, township 28, range 40 E., for a lost mine called the Yellow Jacket, which they found and re-located. They also located another claim and did considerable work on it. While working the latter Putnam and Hayes came across some black looking float rock which they found to be gold bearing quartz, shortly afterward finding the ledge it came from. They hauled 2150 pounds of the ore seventy-five miles, over the desert and Walker's Pass to Tibbett's mill at Kernville and realized about $60, demonstrating the ledge to be rich enough to be practically worked in that out-of-the-way place. This ledge runs almost north and south with hanging wall porphyry, foot wall granite, and talc seam on each side of the ledge. The country around is very broken, with dykes of porphyry cropping out. It has not one redeeming feature outside of its gold properties, as the only wood is sage-brush and the nearest water is at Lander's mill, six miles north.

Placer.

Leary & Chapman are putting on new machinery on the Green mine at Ophir, which has been shut down for the last twenty years. They propose reopening the old shaft, about 200 feet deep, and sinking 200 feet deeper.

The Marguerite Co. at Auburn continue advancing the crosscut on the 300-foot level toward the old Salsig ledge.

At Forest Hill the Westchester drift mine is being reopened. The face of the new tunnel is in the old works, which have to be crossed to reach the unbroken ground.

The Basin Consolidated Co. have let a contract for the construction of 800 feet of bedrock tunnel in their mine at Deadwood.

A strike of very rich gravel is reported from the Red Point mine at Damascus.

The Mayflower Co. at Forest Hill have commenced an upraise to develop the extension of the upper channel mined in front of the Paragon mine. This channel in the latter claim was directly over and 160 feet higher than the bedrock bottom channel. Its width was from 300 to 500 feet, and up to where cut away by the Orono channel its total yield aggregated nearly $1,000,000.

Plumas.

(Special Correspondence). — The Harrison quartz mine, Granite mining district, on Croquetto creek, twenty-three miles south of Quincy, J. J. Lawrence superintendent, has an ore body of 3 feet thick; being developed through a tunnel now in 250 feet which taps the ledge 100 feet from the croppings. Drifts have been run 250 feet northeast and 75 feet southwest. Their improvements consist of a 10-stamp mill run by water power. Their rock is free milling, carrying 2% of sulphurets, which they are not at present saving. It is rated as low-grade ore, averages about $5 per ton. They are working seven men, and mine and mill about thirty tons of rock per day.

Quincy is reached from Oroville traveling northeast by Conley and Neal's stages, three times a week, distance sixty-five miles, and from Reno, Nev., via Narrow Gauge R. R. to Clairville, thence by stage forty-three miles.

The Elizabethtown channel gravel mine, one and one-half miles north of Quincy, is a corporation with $100,000 capital stock, principal office located at San Jose; W. H. S. Beach is superintendent. This company have leased this property of the owners; its extent is half a mile in length of an ancient channel, 100 feet to 200 feet in width. It is a drift mine, and is being developed through a shaft down to bed rock, 100 feet deep, at the bottom of which a tunnel has been run, now in 112 feet, and from which drifting is now going on. They have a steam hoist, and sluices in course of construction. It has lately started having been idle since January, being then driven out by water, just as they had struck pay gravel. As the channel above this mine supported some 2000 people in the early sixties, it is looked upon as one of the coming gravel mines in this end of the State. They are working twenty men at this writing, but expect to double that force.

The Plumas Imperial gravel mine, owned and managed by C. D. Hazzard, is five miles southwest of Quincy. This property consists of about 1000 acres of mining ground, covered by U. S. patent. They are operating three monitors from 4300 feet of pipe. This mine has been in operation for many years, but has only been in the exclusive possession of Mr. Hazzard for the last two years. Twelve men are employed, and the output is satisfactory.

The Quincy Mining and Water Co., is a corporation, the operations of which are located about six miles west of Quincy. The principal owners are James O'Brien and A. B. White. The former is general manager, and the latter superintendent. The water supply of this corporation is taken from Spanish creek and Silver and Gold lakes, and their main canal is thirty miles in length, conveying a constant supply of 1200 inches of water. Their mines consist of the Gopher Hill gravel mine, working ten men, with one monitor, and the Bean Hill gravel mine, worked by ground sluice, employing seven men. Upon these two mines, which cover some 2200 acres, they have over 600 feet of 15-inch and 22-inch pipe. The Bean Hill mine is worked night and day, and can be successfully operated from February to July of each year. These are known to have been good paying mines for many years. The present management have been running them for the last three years. They have but little blasting to do, seldom more than 5 or 6 feet of pipe clay at any time. L. P. Mc.

San Bernardino.

The Memphis quartz mine at Gold Mountain has been bonded for $17,500 to Chas. Lane of the Utica mine. Under his direction some development work has been done and a satisfactory mill test made. Operations have been temporarily suspended by shortness of water supply.

At the Rose quartz mine, in Marengo district, the company is preparing to sink a new main shaft. East of the Rose mine several claims are being prospected in a small way, with results that promise the development of some good mines.

The Holcomb Valley Co. L't'd. has fifteen men employed drifting in Coarse Gold gulch. A new steam-power hoist has been put up.

Shasta.

Free Press: The development of the Niagara mine near French Gulch is going steadily on under the management of R. E. Hanley. Some three weeks since the miners employed by the company in the O'Neil tunnel lost the ledge. Mr. Hanley directed them to push on. A small stringer of the ledge was soon encountered, and developed into a ledge of very rich sulphuret ore four feet in width. The rock is being shipped to the Selby Smelting and Lead Company at Vallejo Junction for reduction.

Sierra.

The new main tunnel being run in the South Fork ground at Forest City is within less than a hundred feet of the deep, lava-capped channel. A large dump is being made at the mouth of the tunnel, and the old-time Bald Mountain engine is to be used to haul out the gravel, etc.

The Bunker Hill and North America drift mines at Gibsonville have been sold to an English company.

Siskiyou.

Journal: The Wright & Fletcher mine, as well as the Gardner mine, will run until the middle of July before making their cleanup. The supply of water for these mines has held out exceedingly well this year.

The Empire quartz mine on Empire creek, Klamath river, is now looking well. A good, permanent lode has been found which prospects handsomely.

The McConnell & Quinn claim is now busy hoisting. They are down about 15 feet and are making splendid progress. The China company that is working the claim will no doubt take out plenty of money this season, as the mine is known to be rich, especially in the vicinity in which they are now working.

Steele and Scheld cleaned up about $900 from their arrastra the first of the week, the result of a few weeks' run from their ledge on Long gulch, about a mile from Hawkinsville. The rock averages about $55 a ton.

The Distlehorst and Barton Klamath River Dredging Company expects to get hoisting between the 20th and the end of this month. The people along the river are watching the outcome of this new enterprise with a good deal of interest. The only doubt of its success has been through the character of the ground in the Klamath, which is filled with immense boulders, with the pay on bedrock.

Last week Eastlick Bros. made a cleanup in their mine at Oro Fino amounting to over $12,000. It was made from ground on which stood the old town of Oro Fino.

Trinity.

Journal: The Sherwood mine, New River district, is showing up well. The mine is running under the management of John Bartlett. They have a good ledge and are taking out ore. The mill will be kept going as long as water lasts.

F. Ladd while ground sluicing the surface of the Mountain Boomer uncovered a rich ledge of decomposed quartz.

S. B. Brooks has commenced operations on the Mary Blaine.

Journal: Last week 88 flasks of quicksilver valued at $3500 were shipped to San Francisco from the Altoona mine.

Great improvements are being made on the placer mines of the Minersville Hy. G. M. Co. at Minersville, and 120 men have been employed for some time past. The wires are now being strung to give telephonic communication with all parts of the property, an electric plant is under construction, and a saw mill is now being erected. The second ditch with a capacity of 2500 inches and the mine is now supplied with over 400 inches of water.

Geo. La Blanc has discovered a ledge of gold bearing quartz on Copper Creek about five miles above Trinity Center. The rock is said to go about $8 per ton.

Yuba.

Democrat: Chicago capitalists had bonded the old Beehive quartz mine and mill near Woodville House. It is stated that seven men are at work under superintendency of Oliver Roberts, and the mine will be opened in good shape.

NEVADA.

ESMERALDA COUNTY.

Ex-Governor Colcord authorizes a correction of the local statement as to the cyanide test of Aurora ore. It does not yield $34 by the cyanide process as stated, as it has never been tested, but will soon, the ore having been sent there for that purpose. It is then expected to yield about $10 a ton.

STOREY COUNTY.

The joint Confidence, Challenge Con. and Con. Imperial west crosscut No. 1 from the surface tunnel is in 557 feet. The face is in porphyry.

In the Crown Point mine the raise from the south drift on the 700-foot level is up 95 feet. The top is in porphyry, with bunches of gold ore through it. The assays from these bunches run from $9 to $12 per ton.

The Belcher mine yielded no ore during the past week. Of the accumulated ore there was shipped to the Brunswick mill 452 tons and 1740 pounds, the average battery sample of which showed a value of $19.56 per ton, and the gross yield of bullion amounted to $7485.07.

No ore was extracted from the Seg. Belcher mine during the past week. There was shipped to the Brunswick mill 171 tons and 60 pounds of ore previously accumulated. The average battery sample assay of the same was $19.67 per ton, and the gross yield in bullion was valued at $3113.95.

In the Savage mine on the 850-foot level they are still stoping ore north and south from the upraise from east crosscut No. 3 up to the 750-foot level. In east crosscut No. 1, on the third floor of the north upraise, they have started a south prospecting drift and advanced it 15 feet in porphyry and quartz giving low assay. During the past week they hoisted eighty-five cars of ore. The car samples average $22.68 per ton. Shipped to the Nevada mill forty-five tons of ore. Shipped to the United States Mint at Carson, July 6th, 457 pounds of bullion, being the cleanup for the month of June. Assay value $11,327.48—$3318.08 gold and $8009.40 silver.

OREGON.

JACKSON COUNTY.

Democratic Times: Work on the Snowgoose ledge, near Steinman, is progressing favorably. A tunnel 140 feet in length to tap the ledge is nearly completed.

The Monmouth Mining Co. of Beaver creek district has started a new tunnel to tap their ledge at a considerable depth. The tunnel will be over 400 feet in length.

Tidings: J. Briner, from the Beaver creek section, reports that the Monmouth Co., which is developing a big ledge in that section, between Bumble Bee and Hungry creek, is starting in on a new tunnel which will tap the ledge at a considerable depth and will be some 400 feet in length. This ledge is one that has been traced a long distance on that side of the Siskiyous, and has also been traced on the north side of these mountains, in Oregon.

WASHINGTON.

Intelligencer: J. Rigby from Cascade district, reports that the ores of Cascade district, while they are known as silver-lead, and are just the kind smelters need the most, carry from $10 to $20 gold, from $30 to $60 silver and from 30 to 60 per cent lead. They are equally as good as the ores of the Kaslo-Slocan county, that are enriching so many mine owners in that section, and are so eagerly taken by the smelters all over the country.

W. C. Butler manager of the Colby-Hoyt mining properties in the Monte Cristo district, confirms the report sent out early in the week of a strike in the Mystery mine, about 3200 feet below the point where croppings of the Pride of the Mountains lead appear above and about 1200 feet below the upper tunnel, in which work is now being carried on.

BRITISH COLUMBIA.

Tribune: The Slocan Boy, which is under bond and leased to Gibson & Keith, has again started up, and from this on will make regular shipments. They have reached the 200-foot level with the shaft and expect to have to crosscut about 30 feet to cut the vein.

The B. C. *Gazette* contains notices of the incorporation of the Alliance Prospecting Syndicate, Ltd., Vancouver; capital stock, $100,000; H. B. and D. B. Irving, and H. Clyne. Emu Mining Syndicate Ltd., head office in England; capital, £10,000. Eric Gold Mining Co., Ltd., Rossland; capital stock, $1,000,000; F. W. Rolt, E. Bowers, J. Hunter, W. H. Lancaster and W. A. Campbell. Green Crown Milling and Mining Co., Ltd., of Spokone, has registered as a foreign company to mine in British Columbia; capital stock, $1,000,000. Mount Adams Mining Co., Ltd., New Denver; capital, $150,000; R. C. Adams, Midway, W. C. Adams, Sandon, and R. B. Kerr, New Denver. Queen G. and S. M. Co., Vancouver; capital stock, $500,000; B. Douglas, Westminster, W. Teague, Yale, and J. McQuillan, Vancouver, are trustees. Red Moun-

tain View G. M. Co., Ltd., Rossland: capital, $1,000,000; W. G. Johnson, W. W. Spinks and I. N. Campbell, Rossland. Victoria Mining and Development Co., Ltd: capital stock, $1,000,000; J. Bryden, M. McGregor and J. E. Martin, Victoria.

At a special meeting of the Maud Hydraulic Co., held recently at Vancouver, the terms of sale of the Maud hydraulic mine were stated to be $5000 within ten days, $15,000 within ninety days and $50,000 before January 1st, '97.

Ashcroft Journal: The first of July still finds the problem of river dredging unsolved. There are now three dredgers on the Fraser not far from Lillooet, one of them built at an expense of about $40,000, one a small affair which and in connection with it about $20,000 has been expended and one that but little is known about, called the Dominion Gold dredger. We understand that at present none are in operation, the big one having been again shut down, probably only temporarily. The small one has made, under favorable conditions, from $50 to $100 in a day, but has not been able to work to advantage, owing to size, length of pipe, etc. At Quesnelle the Fader dredger was at work for some days and washed up about $85 in all. The pump did not work satisfactorily. New machinery will be added and the machine started again, but how soon, we are unable to say, as there is some litigation in prospect. The Underwood dredger, at a cost of $26,000 is a well built machine. It has been tried for a few days but the management have found it advisable to make some change in the machinery and Col. Underwood, the manager, is now in Chicago, expecting soon to return. The Pittsburg company's dredge, Mr. Young in charge, is a well and substantially built machine and, as is the Underwood, very complete. The engines on both these huge dredgers will easily drive them against the swift-running current of the Quesnelle or Fraser, there being four complete engines on each and on the Pittsburg a small electric light engine besides. The Young dredger is now about completed and will soon be working. Another dredger for the Alexandria company is started at Quesnelle for work on the Fraser and another projected for the Quesnelle river above the Underwood leases. We are informed by Col. Underwood that after they have their present dredger, "Pioneer No. 1," working successfully, the company intend building three or four more. It is the same with the Pittsburg company, if successful, or if any one of the numerous designs are made to work satisfactorily, dredgers by the score will be built for operation on the rivers of Cariboo. The estimated cost so far would be, for the six plants already put in or about completed, in the neighborhood of $150,000. The best-informed men in this section think that dredging will be successfully done, but that much time and money will yet be spent in experimenting before this happy result is accomplished.

ALASKA.

Mining Record: Another find was made on the Silver Queen at Sheep Creek a few days ago. From the banging walls within 18 inches of the main tunnel was taken some very rich ore which assays from $300 to $700 per ton. The Topeka will take about 30 tons of this ore and of concentrates on her trip down this week to the smelting works at Tacoma.

UTAH.

Bulletin: Following are the ore shipments from Bingham for the month ending June 30th:

	Tons.
Old Jordan & Galena	500
Old Telegraph	1800
Spanish	185
Northern Chief	200
Tiawaukee	50
Petro	100
Petro lease	75
Neptune	30
Markham group	35
Dalton & Lark	2320
Keystone	20
Fortune	40
Golden Opportunity	100
Antelope	20
Judge Shoppe	20
Lead mine, Sessions & Snyder lease	60
Phœnix	150
Spanish	100
Peabody	20
Summit	20
Black Dog	20
All other sources	150
Total tons	6015

The shipments from Bingham for the six months ending June 30th were:

	Tons.
January	4842
February	4822
March	6701
April	6866
May	7457
June	6015
Total	36,703

Tribune: The float is so rich and so plentiful in State Line that the Rice brothers, who own a group of five claims there, find it pays to ship it, and are confining their labors so far to sacking the boulders that they find on the surface.

Within the last few days some rich gold strikes have been made at the half-year-old State Line district, and the infant camp has suddenly taken a new lease in life. A week ago a vein of quartz heavy with gold was found in the Ophir mine, formerly considered a silver property, and since then similar discoveries have been reported almost daily.

Tribune: Drilling will be begun on the East Golden Gate at Mercur, at a depth of 360 feet, the point reached by the double compartment shaft. As the steel drill burrows into the rock at a speed of 20 to 50 feet daily, when operated the full twenty-four hours, the officers of the company believe that by August 1st they will know the extent and size of the ore bodies of the camp, in which at present about 500 feet is the greatest depth attained in the workings of any mine. Assays of the strata, made at 5-foot intervals, will prove invaluable to them as well as other operators in the camp. The drilling may be continued to an even greater depth and the Rand method will be employed at various places to thoroughly prospect the property.

IDAHO.

Coeur d'Alene Miner: The tunnel in the Union, just below Gem, is now in 300 feet and is expected to strike the ledge in 150 to 175 feet more. They are following a small stringer in which they find more or less ore.

Foster & Co. struck a fine body of concentrating ore in the shaft of the Belle of the West, on Nine Mile, a few days ago, but the water drove them out. They are now driving a crosscut to reach the ledge about the same point as the bottom of the shaft. They have but a few feet farther to go.

Spokesman Review: "I believe the mines in the vicinity of the North Fork of Salmon river will come to the front, and that very soon," says W. H. Macvin. "The mines are about six miles from North Fork, a station on the Nelson & Fort Sheppard railway. The character of the ore so far discovered is iron sulphates, galena and copper. The principal locations thus far made which give evidences of being mines are the Ben Harrison, Maud S., Arnold, Idaho and McDonald. On the Maud S. fine steel galena and gray copper, running high in silver, has been uncovered; but little work, however has been done on the claim. More development has been done on the Ben Hassan and Arnold than on the others. There is a 30-foot shaft on the Arnold and a 5-foot crosscut. As yet there is no sign of the hanging walls.

"The Ben Hassan is developed by a 15-foot shaft. While there were no indications of gold on the surface, the assays at 10 feet showed $7 to $10 in gold and 30 ounces of silver.

"The formation in this country is syenite, porphyry and granite. There are big dykes of quartzite-porphyry and usually between these dykes the ledges are found. It is easy of access."

Tribune: From the annual report of the DeLamar M. Co., Ltd., the following data is taken: During the twelve months the company shipped and received returns from smelters as follows:

	Tons.	Returns.
First-class	99,391	$80,384 22
Second-class	56,710	14,089 52
Concentrates	1935	2,906 02
Totals	161,036	$77,379 76

These gave an average, respectively, of $607.54, $248.45 and $588 86 per ton.

There was in transit 32 tons 771 pounds, embracing the three classes above, estimated at $13,383.07. This makes a total of 193 tons 807 pounds shipped, aggregating $90,762.83. These smelting ores cost the company:

Labor and supplies	$24,713 38
Labor collecting concentrates	1,008 09
Salary of agent	1,200 00
Freight and charges	5,588 25
Total	$32,600 62

Leaving a profit of $58,162.21.

The mill crushed 45,687 tons 25 pounds of ore, the assay of which was $25.40 per ton, divided into gold $18.34 and silver $7.06. The mill worked up to a saving of 78.11 per cent, according to assay, while the bullion returns were 76.57 per cent. Number of bars produced, 260; ounces pure gold, 24,500; ounces fine silver, $434,310.

Value of gold realized	$505,010 13
Value of silver realized	288,928 05
Add for slag, etc., realized	5,758 78
Amount belonging to 1895, realized this year	6,565 07
Total	$806,262 03

The 30-stamp mill ran 350 days 5 hours, and crushed an average of 3 tons 818 pounds dry ore per diem.

The cost of mining and milling was: For mining, including all mine work, retimbering, etc., $5.52 per ton, and for milling, $5.33 per ton—a total of $10.85 per ton. Four dividends were paid, aggregating $80,000, or at the rate of 20 per cent per annum upon the capital stock of the company.

MONTANA.

Record: The Bimetallic Company at Granite is engaged in taking the water out of the shaft of one of their mines, and have a force of men driving the remaining 300 feet of the long tunnel. The company will erect a 60-ton concentrator immediately to work the 20,000 tons of low grade ore now on the dump.

Spokesman-Review: Otto Abeling, superintendent of the Snowshoe mine, near Libby, Mont., reports that the work in both the mine and mill was going on nicely. A recent shipment of sixty tons of concentrates gave 60 per cent lead, 20 ounces silver and $4 in gold. The concentrator is now turning out ten tons of concentrates a day. The shipments have been about 400 tons for the past two months.

Miner: Work has been commenced on the great drain tunnel at Phillipsburg. This tunnel, when complete, will be one mile in length and will drain the Bimetallic and Granite mines at a great depth.

Mountaineer: The Iron Mask mine, which is situated on the top of the White Horse range, at the head of Whipcracker gulch, six miles from Bedford, Jefferson county, was last week sold to Helena and Eastern capitalists for $49,000. The Iron Mask is already a well developed mine, having a shaft down 338 feet. Levels have been run every 50 and 75 feet out on the vein 400 feet, all of which are in good ore. There is 2000 tons of shipping ore on the dump ready for the smelter. The vein is a strong one, 3 to 6 feet wide. Past shipments netted from $300 to $600 per car in lead and silver.

SOUTH DAKOTA.

Times: The Hawkeye M. & M. Co. is now operating twenty stamps on ore from the vein recently opened up on the 150-foot level. The vein is exposed for 60 feet in width in the large stope on the level mentioned. The ore extracted all comes from a new shaft now being sunk about the center of the stope. As soon as it is down 50 feet another stope will be excavated and additional men employed. Twenty-five names are on the pay roll.

A vein of high-grade gold ore has been struck by I Doerstler in one of his claims, situated in Carbonate, about 1500 feet northeast of the Yankee Boy shaft. The rock shows free gold in profusion. The vein is apparently a vertical one, coming up through the slate. The ore is very similar in appearance to the high-grade stuff now being taken from the Durango and Reddy mines, situated in the vicinity of Lead, on the Poorman divide.

A discovery of rich siliceous ore has been made in the old workings of the Strong Bull mine in Galena Camp. The ore is highly crystallized and reported to assay $60 gold per ton. When the mine was operated years ago by Davey & Son nothing was known of this character of ore, and it went over the dump as waste. The discovery tends to prove that these ore deposits are continuous from Ragged Top to Galena, a distance of about twelve miles.

Pioneer: Two shifts of men are at work on the Copper Mountain lode, adjoining the Gray Eagle property, in the southern Hills. A 160-foot drift has been run 200 feet from the surface, in which rich copper prospects were found. Copper deposits of considerable extent have been encountered in various places in the immediate vicinity.

Encouraging reports are received from the new finds on the north fork of Castle creek, about five miles from Rochford. Hooper & Mendenhall are still taking out good ore and Fullerton and others own four claims on the ledge on which the rich find was made sometime ago. The ore is a sandy quartzite and free milling.

MICHIGAN.

In the Tamarack the unusual spectacle is presented of a mine which pays smaller profits as it grows larger. The Tamarack copper mine is a continuation of the conglomerate lode on which the Calumet & Hecla was developed. The Calumet & Hecla was started from the outcrop of the vein, which dips at an angle of 37½ degrees toward the northwest, and the shafts followed the incline of the vein. The conglomerate extends a long distance north and south of the Calumet & Hecla holdings, but on both sides of the big mine has been found either barren of copper, or containing so little metal that the lode could not be profitably worked. The Tamarack Company got the continuation of the lode by buying land, under which the conglomerate passed at a great depth, and began sinking its first shaft in 1883. The conglomerate was reached at a depth of 2262 feet several years later. The Tamarack paid its first dividend in April, 1888, with profits of $11 per share that year, followed in 1889 by dividends of $16 per share, dropping to $13 in 1890, rising once more to $16 in 1891, falling to $12 in 1892 and the same in 1893, and $8 each for 1894 and 1895. The official figures furnished by the directorate show that the Tamarack paid dividends of $600,000 during the eighteen months ending December 31, 1895, while during the same period the net mining profits were but $476,774.55, the amount of $123,225.45 having been taken from the surplus or from moneys received from sale of the new stock, in addition to the actual net mining profits in order to pay the dividends, which were at the rate of $8 per annum. In addition to this, the sum of $449,698.53 was expended during these eighteen months in construction work. No. 5 shaft of the Tamarack, now 350 feet deep, will require four or five years to bottom.

The Tamarack charges the cost of sinking shafts and buying new machinery, erecting new buildings, and the cost of all other work of like nature, to the construction account.

During the ten years ending with 1895, the expenditures of the Tamarack, under the head of construction, amounted to $2,060,385.12.

Total production refined copper for 1895, pounds, 14,000,800; cubic fathoms conglomerate broken, pounds, 16,592; total rock hauled from conglomerate workings, tons, 304,020; total amount of rock stamped, tons, 203,197; percentage of mineral in stamped rock, per cent 3.31; percentage of refined copper in stamped rock, per cent, 2.48; percentage of refined copper in mineral, 73.97; yield of mineral per cubic fathom, pounds, 1.120; yield of refined copper per ton of rock stamped, 48.74; yield of "refined copper" per cubic fathom, pounds, 8.39; refined copper cost per pound at mine, cents, 5.18; total cost of smelting, freight and handling, cents, 1.53; cost per pound of refined copper, cents, 6.70; construction, 2.39; cost of sinking per foot shafts 25.61; cost of sinking per foot winzes, $11.23; cost of drifting per foot $9.29⅔; cost of sinking per fathom, $11.44. No. 2 shaft sunk 4012 feet.

COLORADO.

Republican: For the month of June the shipments of ore from the Cripple Creek district aggregated 10,500 tons. Probably 4000 tons additional of low-grade ore was treated in the local mills.

News: At Leadville last winter a few merchants organized a company, each pledging himself to pay $10 into the treasury until a sufficient working capital had been secured to commence operations. There is now in the treasury almost $4000, providing an ample fund to defray all preliminary expenses. Recently another co-operative company has been formed on a slightly different basis. The new company takes in fifty members, who pay $50 each and $20 per month, thus insuring a capital of $2500 and $1000 a month as a working fund. The new company has leased a group of claims on Carbonate hill, south of the Mahala and west of the great Iron Silver property.

ASPEN.—Attention of leasers, prospectors and investors looking for ruputed good things in the mining line is just now divided between the Woody section, on the Aspen contact, and Old Ashcroft, where H. A. W. Tabor has some properties, says the *News*. In the first named section a large amount of work is being done on claims that have lain idle for years, and leases are in excellent demand. The cause of the activity is traceable to the strike recently made in the Leadville property, which continues to ship regularly one that runs in the neighborhood of 150 ounces out and out. The Ashcroft excitement is due to the reported discovery of ore bearing gold to the amount between $5 and $15. This sort of ore is in several of the mines and samples have been shown here, but it is impossible to ascertain the veins are of any extent. The excitement upon the find, however, is manifest in the rush for properties there.

Nearly all the teasers here are making above wages and some are taking out small fortunes, as, for instance, Peter Mcgregor is knocking down ore in the Alta Argent that shows native silver. He only encountered the streak a few weeks ago, and as his lease expires next month he is losing no time in getting out all he possibly can, and has a large force of men at work. Gray and Mason, who are also working a block in this property, are breaking out ore that is way above the average.

Rumors regarding the operations in the Mollie Gibson and Argentum Juanita are as numerous as ever, but it is impossible to obtain anything like definite information concerning these mines. Strike stories of the Gibson are almost of daily occurrence, but the shipments do not bear out the stories.

The agreement spoken of some time ago as in progress looking to the clearing of the Free Silver mine from water has been entered into. The owners of the property some time ago abandoned the work of attempting to keep the shaft clear, but the Smuggler Co., through its manager, S. I. Hallett, has taken a contract not only to free the mine from water, but to drive the shaft an additional 130 feet.

NEW MEXICO.

SIERRA COUNTY.

Silver City *Enterprise*: The largest hydraulic mining deal New Mexico has ever known will be at the placer fields east of Hillsboro, Sierra county. These placers have been worked in a small way on the surface by Mexicans since 1874, and although no water has been obtainable and the gold has been extracted by dry washing, the miners have made good wages.

The people have been prospecting the ground for six months and have spent $20,000 in preliminary work. The auriferous gravel bed is about 60 feet thick, covers 4000 acres and is all pay dirt. Water for working the mines will be impounded at the head of the Animas river by a dam 150 feet high, and will be conducted to the placers through fourteen miles of 30-inch riveted steel pipes and discharged through the monitor nozzles under a pressure of 360 pounds.

The water will then be conducted to basins where the debris is to be impounded and caught up again in a reservoir in the mesa formed by damming the Percha. From this reservoir irrigation canals will conduct the water to about 12,000 acres of arable land between the mesa and the Rio Grande. The estimated cost of the enterprise, including the purchase of the ground and the construction of dams and pipe lines, is about $500,000.

ARIZONA.

Oasis: In the bottom of the main shaft of the Ibex mine, in Mohave county, a very rich body of ore has been struck.

The Crown mine, in Yuma county, is turning out daily 100 cars of $6.50 and $7 ore. Another 100 feet in depth here will increase grade of this ore to $10 easily, as all the ore chutes show that they increase with depth. The mill is crushing 350 tons per day.

SOUTH AFRICA.

Journal: In the Transvaal the Sheba output for May is as follows; The mill ran 29 days, crushing 4,200 tons, averaging 244 tons per stamp per diem. The gold produced is 6,819 ozs. 15 dwts. 6 grs.; 3,350 tons of tailings produced 2,003 ozs. 7 dwts. 1 gr.; 124 tons of concentrates are valued at 1,203 ozs. 11 dwts. 12 grs. Total for the month, 10,026 ozs. 13 dwts. 19 grs.

Personal.

JOS. M. CUMMING succeeds J. H. Culver as secretary of the Mechanics' Institute.

CHAS. BUTTERS is on his way home from Johannisburg and is due here about August 1st.

H. P. GORDON has resigned the superintendency of the Minersville hydraulic mine, Trinity county.

RICHARD A. PARKER, mining engineer, has returned from Johannesburg and was in the city during the early part of the week.

Recent California Mining Incorporations.

Blanchard G. M. Co., Antioch; J. B. Brown, San Francisco; J. Trengove, J. C. Rouse, J. P. Abbott, A. C. Hartley, Antioch; capital stock, $50,000, all subscribed.

American Bar Mining Company, Nevada City; J. T. McCall, C. H. Mallen, F. Zeitler, J. O. Whitney, D. F. Douglass, F. Searls; capital stock, $10,000,00; $8,752,500 subscribed.

Recently Declared Mining Dividends.

The Osceola, Mich., Copper Mining Co., $1 per share on the 25th; a total of $2,072,500.

Coast Industrial Notes.

—The Cocassett tannery at Benicia, Cal., tan 30,000 hides annually, producing about 1,060,000 pounds annually.

—The Giant Powder Co.s' Black powder works at Clipper Gap are temporarily closed down while a new pipe line is being put in.

—The California Magnesite Co., 65 Union street, San Francisco, are successfully producing carbonic acid gas and other magnesia products.

—Coal has been discovered in Riche canyon, near Redlands, San Bernardino county. The bed developed by a 125-foot shaft is 20 inches in thickness.

—Japan is sending 2000 laborers to the Brazil coffee plantations on a five years' contract. The coolies will each receive $7.50 per month and everything found.

—The railroad over the isthmus of Tehuantepec in Mexico is finally completed and open for business. Fifty-five years have elapsed since the enterprise was initiated.

—The Palermo Land and Water Co. is building a new head dam for their ditch in the south fork of the Feather river. It is to be a crib dam, faced with rock and laid in cement. The cost of the work, it is estimated, will be between $5000 and $6000.

—The newly organized corporation, the Sacramento Electric, Gas and Railway Co., has absorbed the Folsom Water Power Co. and the Sacramento Electric Power and Light Co. There is no change in the controling management. They propose to manufacture acetylene with a portion of their electric power at Folsom.

—The Pacific Coast Hardware and Metal Association is made up of representative firms, not to raise prices, but to facilitate the general transaction of business. The association is officered as follows: President, B. F. Dunham of Dunham, Carrigan & Hayden, this city; first vice-president, Wm. Honeyman of Honeyman, De Hart & Co., Portland; second vice-president, C. C. Reynolds of the Harper-Reynolds Co., Los Angeles; third vice-president, Wm. Schaw of Schaw, Ingram & Batcher Co., Sacramento; treasurer, J. F. Merrill of Holbrook, Merrill & Stetson; secretary, Frank L. Brown of the Washburn-Moen Co., this city; executive committee, W. R. Wheeler of Holbrook, Merrill & Stetson; A. A. Watkins of W. W. Montague & Co.; Wakefield Baker of Baker & Hamilton; H. J. Morton of George W. Gibbs & Co.; A. L. Scott of Miller, Sloss & Scott, and the president and vice-presidents. The association will meet in Los Angeles next December, and in Portland, Or., next year.

—The San Francisco assessor furnishes statistics that give an epitome of San Francisco's manufactures. In the following is given the name of the product, number of concerns manufacturing it, number of male help employed and value of production for last year:

Agricultural implements, 1; men, 25; products, $40,000. Air compressors, 2; men, 25; products, $50,000. Aluminum, 2; men, 10; products, $50,000. Artificial stone, 23; men, 240; products, $350,000. Architectural iron, 7; men, 70; products, $125,000. Axle grease, 4; men, 30; products, $100,000.

Bags, jute and hemp, 3; men and boys, 160; products, $590,000. Barrels, 20; men and boys, 300; products, $500,000. Barbed wire and wire nails, 1; men and boys, 50; products, $75,000. Bedding and upholstering, 14; men, 150; products, $300,000. Bed springs, 2; men, 15; products, $65,000. Bellows, 2; men, 5; products, $12,000. Belting, 4; men and boys, 47; products, $175,000. Billiard tables, 2; men and boys, 6; products, $250,000. Boat builders, 11; men, 40; products, $25,000. Bookbinders, 17; men, boys and girls, 255; products, $250,000. Boots, shoes and slippers, $17; men, women and boys, 500; Chinese, 150; products, $1,200,000. Brass foundries, 5; men and boys, 100; products, $220,000. Boxes (cigars), 4; men and boys (white), 40; products, $40,000. Chinese, 100; products, $30,000. Boxes (paper), 4; men and boys, 100; products, $100,000. Boxes (wooden), 8; men and boys, 300; products, $450,000. Breweries, 29; men, 750; hops consumed, 500,000 pounds; barley consumed, 20,000 tons; beer manufactured, 500,000 barrels; products, $1 700,000. Brooms, 5; men and boys, 100; products, $125,000. Brushes, 11; men and boys, 90; products, $75,000.

Candles, 2; men and boys, 30; products, $75,000. Carriages and wagons, 47; men and boys, 300; products, $100,000. Coffee, spices and chocolate, 24; men, boys and girls, 400; products, $1,750,000. Confectionery, 26; men, boys and girls, 300; products, $650,000. Cider, 4; men, 11; products, $10,000; Cigars, 302; men, women and boys, 250; Chinese, 500; cigars manufactured, 60,863,000; cigarettes manufactured, 2,827,000; products, $1,800,000. Cracker bakeries, 3; men and boys, 160; products, $650,000 Cars, 2; men, 100; products, $150,000. Chemical works, 9; men, 30; products, $150,000. Clothing, 28; men, women and boys, 300; Chinese, 900; products, $1,750,000. Coppersmiths, 3; men and boys, 40; products, $100,000. Cordage and rope, 1; men and boys, 250; product, $650,000. Cloaks, 34; women, 350; products, $150,000. Coffins, 2; men and boys, 50; products, $100,000. Cutlery, 4; men, 30; products, $30,000.

Dry docks, floating, 2; men employed, 60; capacity of dock No. 1, 4500 tons; capacity of dock No. 2, 2000. Dry dock, stone, 1; length of excavation in rock, 490 feet; width at top, 120 feet; width at entrance, 90 feet; capacity of length, 425 feet; capacity of drawing, 22 feet; capacity of pumps per hour, 326,316 feet; total cost of work, $675,000.

Electric machine works, 3; men, 100; product, $80,000. Electric light companies, 2; men and boys, 255; number of incandescent, 77,500; number of arc, 3300; coal used, 26,400 tons; product, $719,000. Electric supplies, 15; men, 100; manufactures, $200,000. Elevators, 2; men and boys, 35; manufactures, $60,000.

Fertilizers, 4; men and boys, 50; product, $100,000. Fireworks, 1; men and boys, 10; manufactures, $20,000. Flour and feed, 7; men and boys, 200; manufactures, $850,000 Foundries and machine works, 40; men and boys, 2000; product $2,000,000 Fringe, 4; men and women, 150; manufactures, $2,0000. Fruit canning and preserving, 9; men, women and boys, 1240; value of vegetables, fruits and meats, $2,000,000. Furniture, 20; men and boys, 200; manufactures, $260,000. Fur, 6; men and women, 150; manufactures, $200,000.

Gas works, 3; men, 500; product, $1,750,000. Gas engines, 8; men, 80, manufactures, $75,000. Glass, 1; men and boys, 150; manufactures, $200,000; glass cutting and bending, 4; men and boys, 50; manufactures, $250,000. Gloves, 12; men, women and boys 500; manufactures, $600,000. Glue, 1; men and boys, 8; product, $40,000. Glycerine, 1; men, 14, product, $15,000.

Harness, 30; men and boys, 200; manufactures, $350,000. Hats and caps, 8; men and women, 100; manufactures $350,000. Ice, 3; men, 35; product, $1,000,000. Ink and mucilage, 1; men, 8; manufacturers, $15,000. Iron fence, 4; men and boys, 20; manufactures, $25,000.

Japanning and galvanizing, 3; men and boys, 50; product, $125,000. Jewelry, 15; men, 125; manufactures, $500,000.

Laundries, white labor 119, Chinese 174, total, 293; men, women and boys, 1300; Chinese employed, 1000. Lasts, 3; men 25; manufactures, $20,000. Lead pipe and shot, 1; men, 50; manufactures, $500,000. Linseed oil, 1; men, 60; product, $200,000.

Macaroni and vermicelli, 12; men and boys, 125; product, $150,000. Malt, 4; men, 50; product, $600,000. Marble, 20; men and boys, 80; product, $150,000. Matches, 3; men and boys, 60; manufactures, $35,000. Millinery, 109; women, 600; product, $400,000. Mirrors, 1; men, 15; manufactures, $20,000. Musical instruments, 10; men and boys, 60; manufactures, $70,000.

Neatsfoot oil, 1; men, 5; product, $5000.

Oakum, 1; men, 20; product, $15,000.

Paint, 6, men, 50; manufactures, $400,000. Picture frames, 10; men and boys, 100; manufactures, $100,000. Pumps and pumping machinery, 7; men, 50; manufactures, $175,000. Provision packing-houses, 3; men, 350; product, $1,500,000.

Quartz mill machinery, 5; men, 300; manufactures, $300,000. [illegible] Rolling mills, 1; men, 350; manufactures, $600,000. Rubber, 3; men, 35; manufactures, $450,000. Rubber stamp, 7; men and boys, 35; manufactures, $40,000.

Safe and vault works, 4; men and boys, 20; manufactures, $50,000. Saw and planing mills, 10; men and boys, 200; manufactures. $300,000. Shirts, 38; men, women and boys, 1200; manufactures, $700,000. Saws, 3; men, 60; manufactures, $135,000. Sash, door and blinds, 12; men and boys, 300; manufactures, $400,000. Ship yards, 6; men, 800; product, $1,500,000. Silverware, 4; men, 30; manufactures, $200,000. Salt works, 6; men and boys, 50; product, $100,000. Soap, 10; men, 75; soap made annually, 9,000,000 pounds; product, $300,000. Soda water, 7; men, 60; product, $80,000. Solder and babbitt, 3; men, 30; manufactures, $75,000. Showcases, 4; men, 15; manufactures, $15,000. Sugar refinery, 1; men and boys, 900; raw sugar used, 282,876,805 pounds; white sugar made, 235,399,133 pounds; yellow sugar made, 13,747,508 pounds; syrup made, 472,090½ gallons; value, $9,405,321.31. Syrup and cordial, 4; men, 30; manufactures, $30,000.

Tanneries (hides), 20; men, 200; manufacturers, $1,000,000. Tanneries (sheep skins), 4; men, 100; manufactures, $175,000. Tinware and tin cans, 8; men and boys, 1000; manufacturers, $1,000,000. Trunks, 2; men and boys, 45; manufactures. $100,000. Type foundries, 4; men, 100; manufactures, $50,000. Tanks, 2; men, 25; product, $30,000.

Varnish, 5; men, 8; manufacturers, $50,000. Veneering, 1; men 30; product, $50,000. Vinegar and pickles, 9; men and boys, 90; manufacturers, $125,000.

White lead, 2; men, 50; product, $250,000 Windmills, 3; men, 20; manufactures, $120,000. Wire and wire rope, 1; men, 100; manufacturers, $375,000. Willow and woodenware, 2; men, 25; manufacturers, $50,000. Woolen mills, 1; men, women and boys, 100; manufacturers, $200,000. Whips, 1; men and women, 6; manufacturers, $15,000. Wood turning and carving, 7; men and women, 125; product, $1,000,000. Water wheels, 1; men, 50; manufacturers, $250,000. Women and children's underwear, 11; women, 150; product, $125,000. Wool scouring and grading, 3; men and women, 300; wool produced, 35,856,690 pounds; wool scoured, 18,000,000 pounds; value of product, $2,868,560.

Commercial Paragraphs.

THE J. H. Montgomery Machinery Co., successors to the Whim Co., of Denver, Col., has issued a book of short rules and useful information and catalogue of common sense mining machinery, which is now ready for distribution, and will be sent free to any address on application.

THE good will of the machinery house of H. P. Gregory & Co. has been bought by the new firm of Henshaw, Bulkley & Belcher, who will in future conduct the business.

THE Washburn-Moen Manufacturing Co., 8 Pine St., this city, this week filled an order from the Tiger-Poorman, Burke, Idaho, for 1500 feet ⅛x5½-inch wire rope, and four flat ropes for the Pearl del Monte Co., Pachuca, Mexico. The latter is made of specially prepared plow-steel wire, with a tensile strength of 275,000 pounds to the square inch.

THE Colorado Iron Works Company of Denver, Col., has just completed arrangements with Mr. C. T. Finlayson of Denver whereby they secure the exclusive right to manufacture and sell the Finlayson patent wire-rope tramway. This tramway is of the double-rope type, having a standing or still rope, which the buckets carriers run, and a traction or tail rope, which regulates the speed of buckets and to which they are attached. One feature of this system is the automatic device for attaching and detaching the buckets to the tail rope. This arrangement, while very simple, has been long sought for among builders and users of the double-rope tramway systems and until now has never been brought out. Another feature is the carriage at each terminal for gradually starting the buckets which are at rest, avoiding the jar to rope and doing away with labor of shoving buckets to give them momentum of rope. Another very important feature is the automatic loading and dumping devices. This is built for light or heavy tonnage. Anyone contemplating the erection of a tramway cannot afford to purchase without first investigating the merits of the Finlayson patent wire-rope tramway. The Colorado Iron Works Company will be pleased to furnish literature and any information desired.

HOITT'S SCHOOL FOR BOYS

At Burlingame, San Mateo County, Cal., is one of the most thorough, careful and practical "Home Schools" to be found on the Pacific coast. It prepares boys for any university, technical school, or for active business; is accredited at the State and Stanford Universities, and under the able management of Ex-State Superintendent Ira G. Hoitt, Ph. D., ranks among the first schools in the United States.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper. *

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS

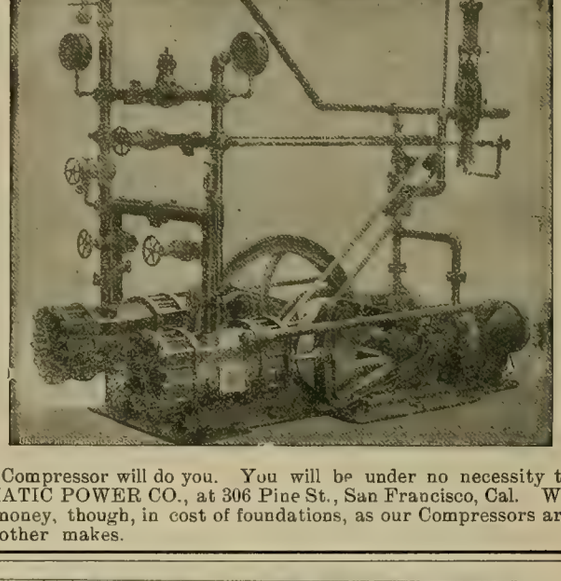
AND FOR USE IN

Milling and Mining Machinery
Reduction and Concentrating Works
Woolen, Cotton, Paper and Pulp Mills
Rice, Flour and Cottonseed Oil Mills
Sugar and Malt Houses
Distilleries, Filter Presses
Stone, Coal and Ore Screens
Stamp Battery Screens
Brick and Tile Works, Filters
Spark Arresters, Gas and Water Works
Oil, Gas and Vapor Stoves
Coffee Machinery, etc., etc.

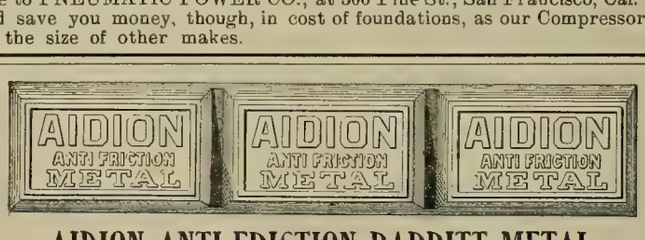
Standard Sizes Perforated Tin and Brass Always in Stock.

Main Office and Works: 209 to 211 North Union Street, Chicago, Ill., U.S.A.
Eastern Office: No. 284 Pearl Street, New York

DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.



AIDION ANTI-FRICTION BABBITT METAL.

Superior to Any Anti-Friction Babbitt Metal on the Market.

USED FOR

High Speed Engines, Dynamos, Rolling-Mills, Steamships, Railroads, Saw-Mills, Cotton-Mills, Paper-Mills, Woolen-Mills, Silk-Mills, Jute-Mills, Rubber-Mills, Sugar-Mills, and all Machinery Bearings.

Gray's Harbor Commercial Co., Cosmopolis, Wash., state:

"We have never used any other than AIDION since we have carried same in stock, and further, that we have babbitted up the 'Thrust Box' on one of our steamers, where nearly every other kind of Babbitt had been used. In every case it had been unsatisfactory, but since putting in the AIDION we have had no trouble in any way whatever."

K. J. McHUGH, Successor to the Adkins Manufacturing Co.
35 NEW MONTGOMERY STREET, SAN FRANCISCO, CAL.

A Large, Valuable Mining Property For Sale CHEAP.

Situated within the Rich Mineral Belt

OF NEVADA COUNTY, CALIFORNIA.

From Emigrant Gap, C. P. R. R., distant in a northerly direction by wagon road eight miles, and consisting of nine full claims of 1500x600 feet each; all heavy veins from 2 to 10 feet wide, one 20 feet. One of which is patented; balance possessory title perfect, with sufficient development done upon six of the unpatented claims to entitle owners to patent. But one of the group has been operated by the present owners; this one (the Last Chance) is now being developed and the ore mills from $2.50 to $102.50 per ton, free gold, and has from the start to present time yielded a net profit of 30 per cent over total running expense. CAUSE FOR SELLING—The company has no capital, therefore the property is too large for us to handle satisfactorily. Would sell a part or all; would prefer to sell an undivided one-half. Price $18,000 cash; or for the whole, price $40,000 cash; or would give a working bond, price $60,000, 20 per cent cash. This is an unprecedented opportunity for mining men of capital to secure a large property at a reasonably small figure. Come and look at it. No middle men need apply. For further particulars, please address S. B. FOWLER, Maybert, Nevada County, California.

FRED R. COOK,
Manufacturer of
LEATHER BELTING, LACING,
ETC., ETC.

(MACARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - - - £100,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

The Kendall system is covered by patents which this company will defend.

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

Owners of mines and reduction works can obtain full information on application to

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR SEPARATING AND SAVING GOLD.—Joseph Mait, Oakland, Cal. No. 563,046. Dated June 30, 1896. This invention relates to an apparatus which is especially designed for separating gold from the lighter worthless particles and gangue, and arresting and obtaining the gold while allowing the waste particles to pass away. It consists essentially of an inclined table having peculiarly shaped grooves or channels made transversely in it at intervals, stationary spoons or stirrers supported from above the table, so that the blades dip transversely into the depressions and supports upon which the table is carried, with mechanism by which it is given an oscillating motion from side to side, and at the same time a tossing or bumping vertical motion, so that the pulp, sand, or gravel flowing down over the table is spread and agitated, and as it passes into the depressions in the table the movement of the table produces a constant agitation of the pulp, sand or gravel and an eventual settling of the gold and heavy metal and sulphurets to the bottom and into a supplemental retaining channel.

PUMP OPERATING MECHANISM.—Hans C. Behr, San Francisco, Cal. No. 563,007. Dated June 30, 1896. This invention relates to that class of pumping machinery wherein a double-acting reciprocating pump or a single-acting pump counterbalanced so as to equalize or distribute the work over the two strokes, is operated from a crank and suitable driving connections, usually toothed gears and a motor. The object of the invention is, first, to prevent acceleration in speed at the dead points of the pump stroke without the use of excessive weights, previously suggested for similar purposes; and, second, to enable adjustments which will cause, if desired, even a decrease in speed at the dead-points, for the purpose of obtaining more quiet action of the pump valves, thereby permitting a greater number of strokes per minute of the pump than could otherwise be practicable, and thus, also, increasing the capacity of the pump. The improvements consist in a proportion of toothed gears, such as have been suggested in connection with a weight, tending alternately to accelerate and retard the motion of the smaller gear, which said smaller gear I connect with a cylinder having a piston subjected continuously on one face to the pressure of compressed air or other gas or vapor, so as to act in the same manner as a weight, but without the drawback of the excessive mass; also, in means for varying the angle of the crank on which the piston acts, in order to enable adjustment of period of maximum effect on piston in relation to period of maximum pump resistance, the object of this being to compensate for the effect of the reciprocating masses of the pump and parts moving coincidently with it, which effect is different at different speeds and requires adjustment to suit the latter.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 6 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

FOR SALE!

A Large and Well-Equipped Gravel Mine.

This is a regular producer, netting from $1500 to $3000 per month. Reasons for selling will be explained to a bona-fide purchaser. Address, **GOLD MINE, P. O. Box 66, Placerville.**

If you want to buy or sell a Mine, Mining Properties or Mineral Lands, it will be to your advantage to correspond with or consult.....

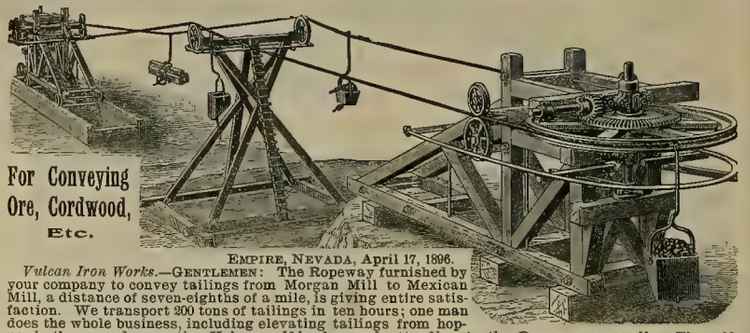
VULCAN ROPEWAY

— WITH —

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

VULCAN IRON WORKS,

London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

RUPTURE CURED.
Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

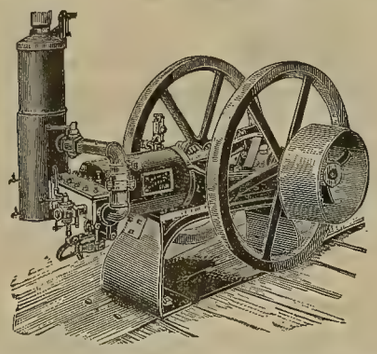
UP TO DATE!

SAVE MONEY



BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c.	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c.	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

Market Reports.

The Markets.

SAN FRANCISCO, July 9, 1896.

Business shows quite an increase in volume compared with the corresponding time last year. While there is more or less croaking about the "silver agitation," yet it must be conceded that business men in general are more confident regarding the future and express themselves as firm believers in the proposition that general trade and finance would soon regulate themselves to any change that might be made in the monetary system of the country. The continued growing activity in the gold mining industry has no little to do with the better feeling in this State. This is further strengthened by seemingly well authenticated reports that one of the best known mining men in Europe will be here in the interest of Europeans and Americans to report on the Mother Lode in this State. Among manufacturers there is a continued good feeling with the outlook favorable for a continuance of orders for structural, mining machinery and other purposes.

The local money market is easy with a continued light call in view of heavy disbursements for interest, dividends, etc. These will aggregate over $2,000,000. At New York the July disbursements will aggregate over $90,000,000, while at other money centers there will be large disbursements. It is reported at the East that some hoarding of gold is going on. This is being done chiefly by Americans. Notwithstanding this, there appears to be an increasing belief that the worst has been seen in general business and there will be a steady improvement.

New York Silver Prices.

NEW YORK, July 9.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	31 7-16	68¾
Saturday*		
Monday	31 7-16	68¾

1894	5,012,693	2,728,771	1,233,446
1895	3,824,496	1,652,523	753,883
1896 to date	1,771,798	492,860	500,532
Corresponding period last year	1,943,380	1,100,767	335,035

A careful study of the above would indicate that there is some hoarding going on either in this country or Europe or probably both. If this supposition is correct then the buyers must have confidence in the future.

SILVER.—The market has strengthened slightly, notwithstanding exporters say that our markets are too high for shipment. Referring to the situation at the East, a New York exchange says: "The small exports of silver the last ten days are due mostly to the fact that the price of silver has been ruling higher here than in London, and yet not high enough to enable dealers to buy in the London market and sell here for import. The shutting down of some of the Western silver mines, owing to the strikes, it is thought may tend to keep the price here higher than in London for a time longer, because it is said the supply on the London market is large enough for present needs. One dealer says, however, that all this may change any day now, because some of the foreign Governments may undertake to fill their monthly orders as early in July as possible. These Governments buy a certain amount of silver each month."

MEXICAN DOLLARS.—The market is quiet at from 54 to 55 cents, according to quality and quanity.

COPPER.—The market has held fairly steady both at home and abroad. Our New York advices indicate that any large sized selling order could not be put through at over 11½ cents, but notwithstanding this the aggregate of expert movements foots up quite well for this season of the year. Referring to the New York market the *Journal of Commerce* of that city says; "The most prominent feature this week has been more or less free selling of Lake Superior ingot from second hands at prices a good fraction below those quoted by representatives of prominent mining companies. To all accounts 750,000 pounds or more were disposed of at 11½c. Whether additional purchases can be made at that rate is not clear, but there is hardly a doubt that 11¾ would be accepted in almost any quarter. Electrolytic has been moving very fairly, mostly at about 11⅜@11½c, as to quantity, and some business in casting stock went through at 10¾@11c. In the London market speculation has been on a smaller scale and prices for merchant bars have fluctuated within the narrow range of £49 a £49 7s 6d. European consumption, however, is still reported as being very heavy."

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is steady with a fair export demand.

The market is quoted as follows:

Home trade, per flask	37 00
Distant points up north	36 25@37 00
West coast of Mexico, for export	32 50

ANTIMONY.—The demand is slow, with the market easy at 7⅞@8¼c in a jobbing way. New York mail advices quote 7⅞@7½c for Cookson's, 6⅝c for Hallett's and 6½c for Japanese, from store.

LARD.—The market is quiet with buyers trying to secure concessions. The increased output of Mexico is said to be a disturbing factor. New York mail advices are to the effect that the market is easy, with only a moderate call for both home and export.

Pig	3 75	@	4 00
Bar	—	@	4 15
Sheet	—	@	5 50
Pipe	—	@	4 75

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The market is strong, in sympathy with the East and Europe. An expected improvement in silver has something to do with it. A New York exchange of July 3 reports: "Prices have steadily hardened the past week, in the face of heavy shipments last month from primary sources of supply and an increase in the total amount of tin on spot and afloat for Europe and America. In the London market there was a rise from £60 17s 6d to £61 7s 6d for prompt delivery, and futures commanded about 10s premium. Spot delivery, actual tin, sold at from 13.50c up to 13.60@13.65c f. o. b. in good-sized lots, and at the usual advance in a jobbing way. Exchange contracts for spot delivery also ranged higher, reaching 13.55c near the close of the week, but futures from August forward were at about 10c per 100 lbs discount and considerably below the cost to import."

The market is quoted as follows:

Pig, per lb	14½c
Plate, I C coke, heavy, per box	$4 25
" " " light, "	4 10

BORAX.—The market is quoted as follows

Refined, in car lots	6¼
Refined, in sacks	6¾
Powdered, in car lots	6¼
Concentrated, "	5¾

POWDER.—There is a growing conviction that the rivalry or competition in this market will stop before long, which, when an accomplished fact, will bring about better prices.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, "	8½c

COAL.—The market is fairly steady for spot, to arrive and shipment.

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 00	@	10 00
" spot, in bulk	— —	@	11 00
" in sacks	— —	@	12 00
Cumberland	— —	@	— —

LUMBER.—There is a fair home and export demand.

The market is quoted in this city from dock or yards as follows:

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—Jobbers report a fair demand at quotations.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 22½
" jobbing, " "	3 35
Cut, carloads, " "	2 97½
" jobbing, " "	3 10

Mining Share Market.

SAN FRANCISCO, July 9, 1896.

Contrary to general expectation the market rallied slightly just before the holidays, with Chollar the leader. When business was resumed yesterday there were higher prices along the entire line. The advance was due to confirmed reports that on Monday they passed through a vein of ore about 2 feet wide assaying $45 a ton while running the Chollar south drift on the 300-foot level, Brunswick lode. This find had not, so far as we are advised, been looked for and coming unexpectedly has raised the hopes of mining men that the 300-foot level is liable to prove more fertile and show considerable of an improvement over the 200-foot level. The writer holds to the opinion that the ore found on the 200-foot level will not only be struck on the 300-foot level but still lower down. This opinion is based on the fact that in Occidental the downward continuation of the ore has been found on the 750-foot level with everything pointing to it's continuing still lower. The buying at yesterday's advance seems to have been largely by moneyed men—those having faith in the Brunswick lode proposition—and after having secured all they could, through cross orders and similar means, the market was sent down so as to get in all the shares possible on the decline. While the work is underway on the Brunswick lode the shares of the mines will be a gamble. If expectations should be realized there can be no doubt but they ought to sell higher on a legitimate business proposition, yet to frighten holders those manipulating the market may make fluctuations of such a nature as to make it dangerous for margin buyers. Outside of the Brunswick lode proposition, the work going on in the mines on the Comstock lode deserves close watching, for in several it is of quite an interesting character.

The following companies had cash on hand on July 1st, according to the financial statements now on file: Andes, $7640.59; Alpha Con., $3016.13; Alta, $8233.84; Best & Belcher, $667.47; Belcher, $2663.02; Bullion, $5393.38; Bulwer Con., $6469.26; Bodie Con., $1150.73; Confidence, $1736.66; Challenge, Con. $1409.53; Con Imperial, $974.03; Caledonia, $4573.65; Con. California & Virginia, $25,769.32 in coin and $34,000, the assessed value of unsold bullion, with the expenses of the past month unpaid; Con. New York, $2247.64; Chollar, $2544.97; Crown Point, $10,118.34; Exchequer, $2353.40; East Sierra Nevada, 47c; Hale & Norcross, overdraft $1483.26 and due bank $3000; Julia Con., $519.34; Lady Washington, $259.22; Mexican, $15,407.15; Mono, $229.68; Ophir, $8559.15; Occidental Con., $13.57, with $4000 due on note at the bank and an assessment in process of collection; Overman, $10,351.70; Scorpion, $1513.98; Silver King, $435.66; Standard Con., $3629.99; Potosi, $14,486.32; Savage, $12,211.77; Silver Hill, $1587.95; Seg. Belcher, $5281.17; Syndicate, $621.37; Union Con., $7584; Gould & Curry, $8144.92; Utah, $2894.

During the holidays a number of San Franciscoans visited Virginia City, including Max Goldman of the Pacific Stock Exchange. They all express themselves highly pleased with what they saw and heard. Mr. Goldman is decidedly bullish on the mines, particularly those on the Brunswick lode. He evidently thinks that all has not been told in their favor. His opinion is shared by the others.

From mines on the Comstock lode our advices are slightly more favorable from Alta, but it points to more time, even after procuring proper connections for ventilation. In the Gold Hill mines no work, so far as the public knows, is being done in Caledonia, Kentuck and Exchequer. In Seg. Belcher and Belcher needed repairs are being done. The bullion return from the ore milled by the former was over $3,100 and of the latter over $7,400. This will help to keep off assessments for a while, at any rate. In Crown Point connection has been made between the 600-foot and 700-foot levels. This admits of work to the west below the former level and extracting gold ore going around $12 a ton. The latter will more than pay expenses. On the 600-foot level a west crossdrift is being run. We are not advised as to work, if any, that is being done in Yellow Jacket. After the annual election this will probably be changed. In Confidence they are still raising for surface ventilation connection. After this has been secured, that mine and also Challenge can be worked on the 200-foot level to a much better advantage. The west crossdrift being run in Con. Imperial ground jointly by Confidence, Challenge and Con. Imperial is in over 500 feet.

The west lode must have dipped to the west or it would have been struck before this. In Alpha they are at work on the 500-foot level, to the west. In Bullion they are still running the long west crossdrift. In Potosi they are at work on the 450-foot level. No ore is reported. In Chollar they are raising over 100 tons of ore a week. It assays over $20 a ton. Advices from Hale & Norcross report a slight improvement on the 700-foot level in the crossdrift that is being run for the ore found in Savage. From the other parts of the mine nothing new is reported. The ore that is being raised is less in quantity and value. In Savage the ore on which they had been raising is of poorer grade, but now work has been started which ought to result well. They raised only about 80 tons the past week. The assays are lower. Work is continued by Best & Belcher and Gould & Curry in the joint east crossdrift from the Bonner shaft. Work is continued in Con. Virginia in the different levels heretofore reported. They raised about 90 tons of ore which assayed about $69 a ton. Superintendent Lyman is engaged in extinguishing the smouldering fires in the old bonanza space. Two of the directors of the company visited the mine and were well pleased with what he is doing and believe that it is the only way to prevent trouble in the future. They found that a regular system of pipe laying had been done to where the fire and gas trouble comes from, for the purpose of letting water slowly run in so as to thoroughly soak the earth and timber that have been used to fill up the apace. By doing this fires by friction will be impossible. Past experience has proven that it is impossible to reach the desired points with carbolic acid gas so as to extinguish the fires and free the mine from the other poisonous gas. Mining men affirm that the plan adopted by Superintendent Lyman is the only practicable one to put the mine in good condition again. Advices from Ophir, Mexican, Union, Sierra Nevada, Utah and Andes, is that work is on the same levels and in the same direction as heretofore reported by us. That in two of the mines is being closely watched by mining men.

Interest continues to be centered on the work that is being done on the Brunswick lode. In the ground owned by Chollar, Hale & Norcross, Savage and Gould & Curry, active work is under way, and any day strikes of ore are liable to take place. The work already done proves beyond a doubt that the lode is fertile and that quite a body of ore may be run into. In continuing the south drift by Chollar on the 300-foot level, a vein of ore about two feet wide was struck about six feet from the Hale & Norcross south line. This ore assayed $40 a ton, and as it had not been expected the hopes of mining men have been correspondingly raised. It was not expected that anything would be found until the drift had been extended from 40 to 50 f et in the Chollar ground. At this distance it is expected that the downward continuation of the ore found above would be run into. This new find on the 300-foot level is thought to be entirely separate and distinct from anything found on the 200-foot level. In Occidental there are reports current of an improvement. The official letter is quite encouraging and causes mining men to believe that good things san be looked for in the near future.

The following illustrates the changes of the week:

Mines.	July 2.	July 9.

Assessment Notices.

NIMSHEW GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Nimshew, Butte county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1896, an assessment (No. 1) of Three cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Mission Pier, No. 1, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of July, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 3d day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. D. COOK, Secretary.

Office, Mission St. Pier, No. 1, San Francisco, California.

MARGUERITE GOLD MINING AND MILL CO. Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 18th day of June, 1896, an assessment (No. 3) of Ten Cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of July, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on FRIDAY, the 28th day of August, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office — 237 12th St., San Francisco, California. Office hours from 4 to 6 P. M.

BEST AND BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of July, 1896, an assessment (No. 69) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 33, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of August, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 27th day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room No. 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

ANNUAL MEETING—The Regular Annual Meeting of the stockholders of the Savage Mining Company will be held at the office of the Company, Room 50, Nevada Block, No. 309 Montgomery street, San Francisco California, on THURSDAY, the sixteenth day of July, 1896, at the hour of one o'clock p. m., for the purpose of electing a Board of Trustees to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

Transfer Books will close on Monday, July thirteenth, at 3 o'clock p. m.

E. D. HOLMES, Secretary.

Office—Room 50, Nevada Block, No. 309 Montgomery street San Francisco, Cal.

ANNUAL MEETING—The regular Annul Meeting of the stockholders of the Best & Belcher Mining Company will be held at the office of the Company room 33, Nevada block, No. 309 Montgomery street, San Francisco, California, on Monday, the thirteenth (13th) day of July, 1896, at the hour of 1 o'clock p. m., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting Transfer books will close on Thursday, July 9th, at 3 o'clock p. m.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

You Can Get $s for Cents!

CRIPPLE CREEK

Is producing $1,000,000 per month, and the output is steadily increasing and making fortunes for investors in mines and stocks. The CRIPPLE CREEK AND CALIFORNIA GOLD MINING & MILLING COMPANY OF SAN FRANCISCO are rapidly developing their group of mines, located on Little Bull mountain near the city of Victor, in the gold-bearing belt of the greatest gold camp in the world.

A LIMITED NUMBER of the shares of the treasury stock will be sold for the purpose of development at the price of Ten Cents per share. The par value is One Dollar, and under the laws of Colorado are absolutely non-assessable.

For prospectus and full particulars call or address E. B. MYERS, Secretary, Room 30, 139 Post Street, San Francisco.

DIVIDEND NOTICE.

The German Savings and Loan Society,

526 CALIFORNIA STREET.

For the half year ending June 30, 1896, a dividend has been declared at the rate of four and twenty-six hundredths (4.26) per cent per annum on Term deposits, and three and fifty-five hundredths (3.55) per cent per annum on Ordinary deposits, free of taxes, payable on and after Wednesday, July 1 1896. GEO. TOURNY, Secretary.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
220 Market Street..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners

By C. W. Moore. With numerous illustrations.....$4 75

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men In cloth, postpaid.....$3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.

By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.

By Sylvanus P. Thompson..... 80 cts.

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.

By T. E. Van Wagenan.....$1 00

The Sampling and Measurement of Ore Bodies in Mine Examinations.

Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages. 8vo., cloth.....olders

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on occallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale of a mine upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....tance of this

Metallurgy of Silver, Gold and Mercury in the United State

Showing the latest practice pursued in American Metallurgical Establishments and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Colu March 31st, '96, the rections. Vol. I.—SILVER. 8vo.....91.86 ounces, and in

RISDON IRON WORKS,

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.
The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec'ty.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec'ty.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. MCIVER, President.

A Colorado Gold and Silver Mine.

Colorado excels in one thing. It is a superb advertiser. While it is inferior in aggregate gold production to California, it attracts more attention from investors because of the publicity its mining men give all their enterprises. Had the Colorado men such a field to exploit as we of California possess, they would doubtless rise to the splendor of the occasion and outdo even their present efforts.

Amid the many fine publications received descriptive of Colorado gold properties, none has been more elaborate in appearance than that recently issued by Leo Von Rosenberg, 35 Broadway, New York City, being a superbly illustrated description of the property of the Gold Coin Mines Co., Nevadaville, Colorado.

About 9000 feet above sea level, fifty miles west of Denver, lies the property treated of, some of which has had considerable deserved prominence by reason of the product and the unusual depth for Colorado, one mine, the California, having a shaft 2250 feet deep.

On this page is depicted an underground scene in the breast of the 700-foot level of the Indiana mine, the darker shading being intended to represent the smelting ore in the vein, the lighter the milling ore, also a view of the stope between the 700 and 800-foot levels. The ore is of an unusual kind, described as being "a mixture of auriferous copper pyrites, iron pyrites, zinc blende, with occasional spots of galena, associated with quartz in a porphyritic-granite matrix derived from the enclosing country rocks."

The gold is not visible in the ore, although it constitutes about seven-tenths of its total value. The minerals form two distinct classes of ore, which occur sometimes separately in the veins and at other times run side by side in well-defined pay streaks. The ore occurs in a succession of long swells or lenticular-shaped bodies, there called "shoots" or "chimneys." The country rock is granite gneiss, frequently cut by quartz-porphyry dikes.

At the time the photograph from which the picture below is made was taken—about three months ago—that level had a total length of 783 feet,

HANGING WALL. VEIN. FOOT WALL.

STOPE BETWEEN 700-FOOT AND 800-FOOT LEVELS, INDIANA MINE.

HANGING WALL. VEIN. FOOT WALL.

BREAST OF 700-FOOT LEVEL, INDIANA MINE, NEVADAVILLE, GILPIN CO., COLORADO.

of which 255 feet was on Indiana ground. At the face the ore body was 2 feet thick and in the level and the stopes it varied from 18 inches to 5 feet.

The 800-foot level, 148 feet below the 700-foot, has a total length of 1039 feet, of which 511 feet are in the Indiana ground. The ore body in this level shows considerable variation, the minimum being from three to six inches and the maximum about six feet. In the stopes the ore body is three feet thick.

The 900-foot level, 84 feet below the 800-foot, the leading level of the mine, is now 1121 feet long, 593 feet being in the Indiana territory.

Many of the present ore exposures in the various parts of the mine show the vein to carry smelting ore, varying from two to nine inches in thickness. No ore has been stoped below the 900-foot level.

On page 48 appears an illustration of the stope in the Indiana mine between the 800 and 900-foot levels.

Labor at Central City is cheaper than in any of the other precious metal mining districts in Colorado. The average is $2.50 for miners for each shift of ten hours; car men, helpers and surface men receive from $1.50 to $2.00 per day.

Much of the work of drifting, stoping and assorting of ore is done by contract. Drifts are run at from $5.00 to $7.00 per foot, while the cost of blasting ore in the stopes is from 50 cents to $2.00 per ton according to the varying width of the ore breasts. The company employs about 100 men at present.

Without any personal knowledge of the concern, the company appears to be fortunate in many respects, notably in intelligent, conservative management. When one realizes the loss to stockholders and the injury to a mining section so often occasioned by the ignorance or carelessness of a mine manager, it will be seen that the importance of this factor is not overrated.

For the three months ending March 31st, '96, the company produced in gold 3691.86 ounces, and in silver 14,744.36 ounces.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Breast of 700-foot Level, Indiana Mine, Nevadaville, Gilpin Co., Colorado; Stope Between 700-foot and 800-foot Levels, Indiana Mine, 45. Stope Between the 800-foot and 900-foot Levels, Indiana Mine, Nevadaville, Gilpin Co., Colorado, 48. Part of the Nantasket Beach Line, Showing Overhead Trolley and Experimental Piece of Track Laid with Third Rail: This Shows the Comparison Between the Two Methods; Car on the Rail Moved by Third Rail Contact; Section of Truck Showing Method of Contact; Dynamo Room of Power House No. 1 of the N. Y. N. H. & H. R. R., 49. A Day's Shipment of Cable-Road Ropes, 53.

EDITORIAL.—A Colo ado Gold and Silver Mine, 45. Sales of Mining Property on Contracts; Loss of Gold in India; A Masonry Dam in the Yuba River; The Milling of Auriferous Gravels; The Copper Mining Outlook; Old Trinity and New Trinity; Of Local Interest, 46.

ELECTRICAL PROGRESS.—Electrical Advance in Railway Transmission; Electric Power at a Colorado Mine, 49.

SCIENTIFIC PROGRESS.—How Electricity Manifests Itself and What It Can Do; Exposure of Coal to the Weather, 50.

MECHANICAL PROGRESS.—The Coming Boiler; A Change of Practice, 50.

PRACTICAL INFORMATION.—How Poisons Act; When the Blood is Cold; A Simple Rule; Coal Tar for Making Colors; Difference Between Anthracite and Bituminous Coal, 50-51.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 54-55.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 62.

MISCELLANEOUS.—Concentrates, 47. Asbestos and Its Uses; A Novel Plan; Per Capita of Gold Money in the United States; A New National Park for Wyoming; Electrolytic Treatment of Low Grade Auriferous Copper Ores; A Marine Curiosity, 48. Notices of Recent Patents; Commercial Paragraphs; Recently Declared Mining Dividends, 51. Coast Industrial Notes; Shipment of Cable-Road Ropes, 53. Personal, 55.

IT is not uncommon for sales of mining property to be made on contracts by which part of the price is paid and possession of the mine given, this possession to be relinquished and the part payment made to be forfeited in case default is made in paying the balance of the price. The California Supreme Court has made a decision which would seem to bear a construction nullifying the forfeiture provision of such contracts, and making the amount paid, less actual damages to the property, recoverable in the event of default of full payment being made. A case in which this is the point at issue is now in the Montana Courts at Butte.

INDIA has always been considered an absorber of silver. That it is also an absorber of gold is not so generally known. An Indian statistician has been investigating, and his conclusions are of considerable economic interest. This absorption of gold he has considered, is an absolute loss of the metal in the manufacturing jewelry trade. The native goldsmiths use a coloring solution in which some of the gold they work with becomes dissolved. This solution and its valuable gold content is thrown away without any effort being made to recover the gold. Small in amount as this is for the day's work of one workman, so large is the number of workmen that he estimates that a ton of gold is wasted annually in the Province of Bengal alone. Ignorance is responsible for this loss, as three-fourths could be avoided by collecting and working the solutions now thrown away.

THE preliminary excavation work has been commenced on a 100-foot high masonry dam in the Yuba river above Smartsville. The purpose of the work is to furnish a fall for the development of electrical power for transmission to the Smartsville and Browns Valley mining plants, and to Marysville for general industrial use. Hydraulic miners generally will watch with interest the progress of this enterprise. It is gratifying to find the possibilities of profit in the development of electrical power so alluring that private capital hastens to anticipate the lagging Government. This dam in the Yuba river will take care of all the hydraulic mining tailings of Nevada and Yuba counties, and will enable the Debris Commissioners to expend the National and State appropriations in dams on other rivers where restraining works are required just as much as on the Yuba.

The Milling of Auriferous Gravels.

Where there is coarse gold in auriferous gravel there is fine gold. This elementary proposition seems to be lost sight of in the practice of milling the cemented gravels in the drift mines. Because the gold obtained is placer gold, and largely in coarse scales or grains, it is more often than otherwise assumed that there is no fine gold at all, or so little as not to be worth consideration. Whether or not fine gold is being lost that, as a commercial proposition, it would pay to save should in every case be determined. Samples of the tailings should be taken and parted by the finer mesh screen it is desired to compare with. It is taken as a fact that the practice being to get quantity through these mills, the screens used are, if anything, coarser mesh than a determination of the highest economic efficiency would suggest. The percentage of coarse tailings caught on the screen is determined, also their assay value, and from these two the gross loss per ton. From this should be subtracted the loss per ton in tailings that pass the finer screen, and the difference is, technically avoidable loss. Whether or not it is all the technically avoidable loss will require tests of identical samples with several screens till the screen mesh is determined beyond which no appreciable saving is made by a finer mesh screen. The assay samples required for these determinations of loss will have necessarily to be large, to get assay buttons that can be weighed. The maximum of technically avoidable loss and required screen mesh having been determined as indicated, the practical problem is how much of this must be sacrificed to save the remainder, which may be distinctively termed the commercially avoidable loss, at a profit margin over milling cost.

Trial mill runs should be made with several screen meshes, none of course with finer mesh than that determined in the sample test as the most efficient, technically, and the ton costs of milling ascertained. With increasing coarseness of screen mesh there is a decreasing ton cost of milling and an increasing technically avoidable loss in the tailings. The commercial ton cost of milling is that cost in which the decrease from the ton cost of milling with only technically unavoidable loss exceeds the technically avoidable loss per ton by an amount sufficient to cumulate a justifiable profit margin over the working cost of milling. This profit margin is necessarily a matter of the mine owners' judgment and will vary with conditions. It is suggested that it should be considered as interest on the investment in milling plant and determined accordingly.

The saving of a technical loss of 50 cents a ton by the expenditure of 60 cents a ton in increased cost of milling condemns itself as a commercial proposition. The saving of 40 cents of the 50 cents at an expenditure of 10 cents in increased cost of milling leaves a profit margin of 30 cents a ton which would commend itself as a commercial proposition.

The suggestion to assay is advised. Panning these tailings without grinding through a screen first will show no loss even though a common magnifying glass on the same tailings shows gold in fragments of the cementing matrix of the gravel. Even with grinding the panning tests would not show the amount of the gold loss with sufficient exactness.

Consideration should be given to the fact that there are variations in the amount of fine gold in the gravels of the same mine, which justify economically different rates of milling to maintain the uniform commercial profit margin indicated.

On this subject of milling auriferous gravels there is a notable lack of recorded data available for comparison and for the formulation of general rules of practice. About all that is generally conceded is that the tailings carry away gold sufficient in amount to make tailing claims below many of the mills profitable. What the tailing claims get, however, is necessarily but a fraction of the gold that passes the mill, and the results obtained in a few tests indicate that the loss is very considerable and commercially avoidable.

The Copper Mining Outlook.

The consumption of copper is a matter of considerable interest to miners on the Pacific coast at the present time. It is only a few years since the production of copper was so much in advance of the consumption that discoveries of copper ores on this coast attracted no attention from capital, and were economically unavailable. This is not the case now. Last year the consumption of copper was 8000 tons in excess of the year's production, and this year the demand indicates that production will be 35,000 tons short. Foreign consumption is increasing at the rate of 62,000 tons annually. This is the secret of the values in the Trail, B. C, ores, which, while they carry commercial quantities of gold, are technically copper ores. The Shasta county, Cal., ore deposits, while not yielding as large percentages of copper, have gold contents which, in connection with the copper, should and will make them commercially available. The problem for the California deposits is practically one of treatment of the ore. That these ores could not be treated profitably ten or fifteen years ago is no reason for neglecting them now. Metallurgical science in the treatment of ores, and particularly copper ores, has made enormous advances since then. Spokane capital has been quick to appreciate and appropriate the profit possibilities of the British Columbia copper-gold mines. San Francisco capital ought to secure the wealth of the gold-copper mines of California.

Old Trinity and New Trinity.

The Trinity county gold mining industry to-day is an excellent illustration of the effect of the successful investment of a single financially strong company in stimulating the development of dormant gold mining resources. As late as 1892 the superficial outlook for gold mining in that county was that its importance was decreasing with nothing more substantial than hope to build a belief in a change the other way. The gold production had been decreasing, the population was moving away, one mining property after another was closing, and though the mines that continued going were profitable, and the county still had its great quartz mine, the Brown Bear, the prevalent feeling was, that the mines then going were all. The annual gold production was then about $600,000. With the advent of the La Grange Company in 1893, taking one poorly equipped hydraulic mine and giving it a plant and water supply commensurate with its extent and gold content the unexpected happened. It was realized then by residents and mining investors from the outside that only the fringes of the vast placer deposits of the county had been mined, that claims that had been idle for years were not therefore worked out, and with the courage and faith born of imitation of a success, capital, enterprise and intelligence have taken these great placers and half-worked mines, and are rapidly bringing them among the great gold producers of the State. The annual gold product increased to $1,012,000 in 1894, to $1,167,000 in 1895, and the the returns of the first half of 1896 indicate that the ratio of increase will be kept up.

Of Local Interest.

Taking advantage of the failure of the Mineral Land Classification Act at the last session of Congress, and anticipating its passage at the coming session, the railroad is pushing the patenting of its grant lands in the mining counties through the local land offices and the Department at Washington. With the Government land officials assisting the railroad, the odd section mineral lands are being gobbled up so rapidly that the passage of the Classification Act by the next Congress will have the significance of the political platforms which gave the "law to the North and the nigger to the South." There will be no mineral land to classify, but the miners and prospectors of California will have the law.

There does not appear to be any method of applying a wholesale stopper to the wholesale grabbing of the mineral lands. There is, however, a line of procedure which can be used individually to protect the locations of miners and prospectors on these lands even where these locations are in the development stage of growth into mines. An official survey for patent should be applied for and made. In doing this the expense can be lessened and the effectiveness increased by consolidating the claims of adjacent owners. Follow this by application at the

local land office to enter the claims for patent, which will be refused on the ground that the approved filing of the railroad covers the land. The next step is to have a citation issue from the Land Office to the railroad directing it to show cause why the filing should not be cancelled. This brings up the issue of fact for judicial determination with the burden of evidence on the railroad end. This form of proceeding has been successfully followed in many cases where through fraud or oversight the railroad filing had been approved by the local land office and certified to Washington. It should prove effective in the cases where protests have failed from technicalities. Some of these were made on mines that have been continuously worked for twenty-five years and upwards, and from which gold is coming to-day. Modifications of the plan indicated will necessarily be required to meet particular cases. These need no elaboration here.

Concentrates.

ACCORDING to the local paper, there are no idle miners in Austin, Nev.

THE Prescott, Arizona, *Courier* wants a 20-stamp mill and ore reduction works built there.

THERE are three cyanide plants in operation in Tombstone, Arizona, and a fourth under construction.

THE U. S. Surveyor General's office at San Francisco is overcrowded with mineral survey applications.

EVERY mining paper in every locality tells of activity, new work, contracts let, getting ready to ship or mill ore, etc.

A COLORADO mining company, The Inter-Ocean, is said to insure all its employees for $5000 in an accident company.

REPORTS made to the Director of the Mint at Washington indicate that the world's production of gold for 1896 will be $220,000,000, against $203,000,000 in 1895.

RAINY LAKE DISTRICT, Minn., is a gold mining locality fast rising into importance. Two hundred stamps, the local papers say, will be crushing quartz by August 1st.

It is Part I of Aaron's assaying of which a third edition has lately been issued. There is no present intention or apparent necessity to issue new editions of Parts II or III.

A CONTRACT has been let for the construction of 11 miles of ditch to bring in the water of Whiskey and Boulder creek to the Princess hydraulic mine at Muletown, Shasta Co.

SHASTA COUNTY is to build a road which will connect Redding with the Bully Choop and Harrison Gulch mining districts, on the line between Trinity and Shasta counties.

"GILES OTIS PIERCE is connected with the Pike's Peak Mining Tunnel Railway Co." Very likely. That is just about the kind of thing Giles Otis Pierce would be connected with.

THE San Francisco company which recently incorporated to extract gold from the black sands of Fraser river, B. C., reports that 250 tons treated at New Westminster yielded $30 per ton.

THE Miners' Union of Cripple Creek ordered a strike of all members of the union on the 15th. The demands are that none but union men be employed, and that wages shall be $3 for eight hours' work.

"WHAT does Bryan's nomination denote?" asks an Auburn correspondent. Well, this paper is not in politics, but the event cited certainly denotes the convention's admiration of a rattling good speech.

THE disagreement between the Old Dominion Copper Co. and its employes at Globe, Arizona, has been settled satisfactorily. Men in the mine and smelter are to get $3 and general surface labor is to be paid $2.50.

NORTHERN ARIZONA is experiencing a water famine. Mines have had to close down and prospecting is impossible. The water supply of large towns on the A. & P. road has given out and water has to be brought to them by the trains.

THE days when fortunes can be picked up in California gold mines have not gone by yet. A large nugget has just been found in the Howland placer mine on Coffee creek, near Trinity Center, Trinity Co. It weighs 42 pounds and is valued at $9072.

AN injunction suit has been commenced in the Yuba Co. Superior Court against the Cleveland and Sierra Mining Co., who are hydraulicking near Scales, Sierra Co., to enjoin the discharge of the tailings into Rabbit creek, 100 miles above Marysville.

IT is stated in Redding that a contract is to be let for the erection of 500 small roasting ovens at the switchback on the Iron Mountain Railway, above Keswick. Men are grading the site for the roasters and building trestles and chutes, by means of which the ore will be handled by gravity.

GOLD to the amount of $1,800,000 was deposited for coinage the first day after reopening the San Francisco mint. This is practically the amount of gold that has been accumulating since the mint closed on June 30th. Its significance as indicative of the probable gold yield for 1896 needs no explanation.

THE San Francisco Mint resumed coinage on the 10th inst., after the annual examination and accounting was concluded. There are 11,000,000 ounces of fine silver in bars, which will be coined till further orders. The coinage for the year ending June 30, 1896, aggregated $22,955,500 gold and $1,377,451.50 silver.

EXPORTS of chrome ore from Turkey are reported to have greatly increased during 1895, the prices ranging from $17 to $18 a ton. During 1894 3080 tons were mined in California and shipped from San Francisco. In 1895 the shipments were 1740 tons. The variety of use and consumption of the ore is increasing.

THE revival of gold mining is drawing other enterprises in its train. Telephone lines are now reaching out to even the most distant mining towns in California. Sawyer's Bar, on Salmon river, in Siskiyou county, only accessible by wagon road since 1892, is to be connected with Etna, Fort Jones and Yreka by telephone.

COMMISSIONER LAMOREUX appears to have endeared himself in Montana much as he has in California. He has expressed himself there in opposition to the desire of the State to have the Yellowstone Park boundaries modified to permit a railroad construction to the New World mining district. What else could Montana have expected?

THE native labor question is still prominent in the Witwatersrand, South Africa, district. Over 1000 new men are monthly secured by paying a premium therefor. It is proposed to get even on this new tax by reducing the meager wages $2.50 per month, an attempted adjustment of expenditures that does not seem to promise permanent satisfaction.

IN the Cariboo, B. C., mining district, the British Northwest Gold Mining Co has organized with a capital of $5,000,000. It is a consolidation of the Fishback mine, the Maud Hydraulic Mining Co, and other Quesnelle properties. Seattle, Wash., residents and representatives of English bankers constitute the directorship of the biggest placer mining scheme ever proposed in that region.

THE devices employed by miners to overcome the difficulties they meet with are sometimes unique enough to be notable. Water carrying flumes have been built on iron brackets on the face of cliffs, as, for example, that on the Miocene ditch in Butte Co., and some Placer Co. miners suspended their sluice boxes along cliffs by ropes and worked an otherwise unavailable mining claim.

A NEW electrolytic method of treatment of low-grade auriferous copper ores is proposed by a Dr. Mulholland of N. S. W., a description of the process appearing in this number of the paper. If commercially successful there would appear to be a considerable field for its application in this country. There have been many unsuccessful efforts to work this class of ores in California by free milling, and to a limited extent by smelting.

THE grass root discoveries of chalcopyrite (copper-iron sulphide) ores carrying gold in British Columbia suggest a locality in Del Norte and Humboldt counties in this State, and in southwestern Oregon, where ores of this character have been found recently. Not being free milling quartz and unlooked for, the discoveries have attracted scarcely even local attention. If such ores are valuable in British Columbia why not in California and Oregon?

A GOLD discovery in Soledad canyon, Los Angeles Co., has caused several speculators to locate mining claims on patented "agricultural" land. While it is a question of fact as to whether the land is "agricultural," yet the possession of a U. S. patent by its holders renders useless any attempt to locate a mining claim thereon. It is a waste of effort to attempt the location of a mining claim on land held by a U. S. patent by any one other than the holder of the patent.

ADMIRAL SELWYN, who, sometime ago, publicly advocated in this city his "Zymean" process of gold extraction, writes to the *London Mining Journal* that the Rigaud process, now being tested at the works of the Total Gold Extraction Co., Havre, France, is virtually the process of which he is the inventor and patentee. The admiral opposes amalgamation and advises dry crushing. In some things the admiral is at sea, which is where one would naturally expect an admiral to be.

IN many of the placer gold districts of Alaska the ditches required to bring water on the claims are short. Ditch construction is, however, hampered by difficulties that offset this. It is usually necessary to build fires to clear the ground of the tangled mass of fallen timber and moss that covers the surface of the country to a depth of several feet, and in many cases to render it impossible to excavate. This surface condition also exists in the more northern districts of British Columbia in the Cariboo and Horsefly country.

A SYNDICATE in brimstone is the latest trust reported. The production of sulphur in Sicily, three-fourths of the world's consumption, is to be controlled by contracts with the mine owners, who, it is claimed, have been working on an unprofitable basis at the low prices that have been ruling. The sulphur mining industry in Louisiana, though not included in the trust, will be benefited, and the output from the mines there may, if their expectations of yield are realized, prove a serious obstacle to the success of the trust in this country.

FROM Redding a report comes of the projection of an iron mining enterprise in Shasta county carrying a number of other industrial developments in its train. The water of McCloud river is to be utilized in an electric smelting plant near the junction of the Pitt and Sacramento rivers. Water is to be piped from this point to Redding. A railroad is to be built from the mines to the smelter and thence to a connection with the Southern Pacific. The scheme is large, very large. It is some time since an effort has been made to smelt iron on this coast.

FOR three years J. C. White has been receiving from Yuba county $200 per month as a member of the Executive Board of the Anti-Debris Association. Mr. Phipps and Mr. Devlin are, among others, also under salary. The whole thing constitutes a heavy and unnecessary burden on the taxpayers of the counties furnishing the money to maintain a costly organization whose existence is rendered unnecessary by the activity and constant jurisdiction of the U. S. Debris Commission. The expenditures of the counties' money has been this week the subject of official investigation.

THE Pocahontas Gold Mining Co.'s property, according to the *Wall Street Reporter*, is a good thing—to which can be added that it is a good thing to let alone. While it is undoubtedly in California, because the *Reporter* says so, there is a vagueness of description of the locality and the property permissible in a romance writer relating a tale of pirate treasures, but very much out of place in the presentation of a mining proposition to the investing public. There are three Pocahontas mines in California, maybe more. Which one of them is masquerading in the account referred to?

THE *Star* thinks that the recent visit of the supervising special agent of the Treasury Department to Nogales, Arizona, will result in the erection of a Government sampling works there at a cost of $10,000. A late appropriation by Congress for the establishment of such works sets aside $45,000 for three Government works, one to be at El Paso and the other two on the northern boundary. The act provides for the erection of other works, or rather for the erection of additional facilities for the collection of customs, the expense of such additional facilities to be paid for not out of the appropriation, but out of the usual fixed fund for the maintenance of the customs service. An average of four tons of ore daily passes through Nogales.

THE Minister of Mines in British Columbia endeavors to keep in working touch with the industry in his charge. Instead of publishing annual reports alone, which lose their possible utility by delay, the reports are published as rapidly as the data comes in, in bulletins, which, dealing with conditions to-day, are available to be read to-day. We have no official position in this country corresponding to the Minister of Mines, but the U. S. Geological Survey and several State mineralogists and geologists might make a try at the practical work done by our neighbor.

THE gathering of float boulders of ore appears to be quite a profitable industry in a number of mining districts outside of California. Shipments of this character are made by the carload, sometimes the trainload, in the Black Hills, S. D., and in the Rossland District, B. C. In this connection it is notable that incorporations have been made of properties in the latter locality that are floating out to the mining stock investors on this unsubstantial float. With the report that profitable shipments of float are being made comes the significant statement that no ledge has been found yet.

A SEQUENCE of the closing down of the hydraulic mines since the Anti-Debris agitation commenced has been the abandonment and destruction of many of the extensive and costly reservoir and ditch systems which supplied them with water. In all of the mining counties miles of these old ditches and broken down flumes can be seen. Some few of them may be restored for hydraulic mining, and occasionally to supply power for a quartz mining plant. For this last-named purpose the utility is limited, the water season of many of them being short and interrupted by snow. The old reservoirs, however, remain useful for storage for the new ditches for irrigation and water power developments that are being made at elevations below the snow line. The rapidly growing demands on these have necessitated storage to supplement the dry season shortage of the stream flows. All of the old mining reservoirs, however small, are thus recovering their original value, and the reservoir sites that still remain unutilized are being acquired by the water companies in anticipation of being needed in the near future.

THE Commissioner of the Land Office has issued a circular letter to the Registers and Receivers at the District Land Offices, calling attention to the fact that a strict compliance must be made by applicants for mineral patent with Paragraph 35 of the mining circular approved Dec. 10th, 1892. The paragraph says: "The notices so published (in a newspaper) and posted must be as full and complete as possible, and embrace all the data given in the notice posted upon the claim. By departmental decision of May 23, 1896, in the case of Gowdy vs. Kismet Gold Mining Company, it was held that a strict compliance with said paragrapn 35 will be insisted upon and in that case republication was required by reason of the fact that the published notice failed to contain a reference to the names of adjoining or nearest claims. In view of the fact that most published notices fail to comply in some particular with the above quoted regulations, your special attention is called to said decision and you are enjoined to comply with said regulations in the preparation of notices for publication. Said decision will be found reported in volume 22 of Land Decisions when the same shall be published."

THE courts, in deciding mining cases, have been exceedingly liberal in construing the requirements of the law to make locations of mining claims. The technical accuracy of description of the claim in the notice of location has never been held to be essential to make a valid location. Nevertheless it is well that locators should be particular in this matter. Litigation would be avoided in many cases, and the work of perfecting title simplified and rendered less tedious and costly. The Interior Department, when it comes to patenting a mining claim, is exacting where the courts are liberal. It is frequently necessary to relocate a mining claim, and to make an entirely new chain of title to the owners before an official survey for a patent can be made. This involves delay and expense which can be avoided by accuracy in the location notice in the first instance. It is not necessary to have the location made by a survey, though it is preferable usually. The essentials are: 1st, That the corners should be marked on the ground by stakes in mounds of earth or rock, or by marked trees or other natural objects; 2nd, The notice of location should describe these corners so that they can be identified on the ground by the description, and, in addition, the direction and distance of one of the corners from a Government corner, or well-known permanent object, such as a junction of roads, trails, or ravines, a bridge, building of any kind, or natural rock monument or mountain peak should be given. It costs no more at the time of locating to observe these two requirements, while later on they may mean a considerable economy of time and money.

WITH its usual enterprise this paper, the pioneer in the mining and mechanical industries, is essaying the difficult task of publishing a list of the mines of the State, their character and location, and the name and address of the owner or superintendent. In the course of publication much commendation is received and some adverse criticism. The latter is chiefly valued, is expected, and is mainly deserved. At the outset it was plainly and candidly stated that the matter was only an approximate attempt, with no claim to absolute accuracy, and solely with a view to approach some degree of correctness in the important project essayed. The enormous demand for back numbers containing the lists indicates that manufacturers and dealers are not unmindful of the commercial value of such a list. Its publication has practically made unnecessary the appearance of ephemeral publications of doubtful business value. In this regard, however, it is in order to say that no list such as is now being published in these columns is of much value longer than six months. Miners are migratory, and herein lies the value of this paper as an advertising medium. Whenever a mining man changes his address, about the last thing he does when leaving or the first thing after arriving at his new location is to write this office, ordering his paper changed to his new address. The MINING AND SCIENTIFIC PRESS follows him wherever he goes; its value is a constant one. A list however accurate is good only for a very limited time, a fact not always readily recognized by senders of circulars, etc. Upon completion it is contemplated to issue the list in its entirety, corrected to date.

Asbestos and Its Uses.

There is probably no production of inorganic nature about which there is so much popular mystery and misconception as asbestos. It is vaguely understood that the principal claim of this remarkable product to attention is that it cannot be consumed by fire. It is of more importance to the human race to day than it has been in the whole range of history. Asbestos twenty-five years ago was practically not known in the laboratory of the chemist or mineralogist. It now finds its way in one form or another into every workshop where steam is employed.

To the question, "What is asbestos?" it is not altogether easy to find an answer. Geologists classify it among the hornblendes. In itself, asbestos is a physical paradox, a mineralogical vegetable, both fibrous and crystalline, elastic yet brittle, a floating stone, but as capable of being carded, spun and woven as flax, cotton or silk. It is, apparently, a connecting link between the vegetable and mineral kingdom, possessing some of the characteristics of both. In appearance it is light, buoyant and feathery as thistledown; yet, in its crude state, it is dense and heavy as the solid rock in which it is found. Apparently as perishable as grass, it is yet older than any order of animal or vegetable life on earth. Seemingly as combustible as tow, the fiercest heat cannot consume it, and no known combination of acids will destructively affect the appearance and strength of its fiber, even after days of exposure to its action. It is, in fact, practically indestructible. Its incombustible nature renders it a complete protection from flames, but beyond this most valuable quality, its industrial value is greatly augmented by its non-conduction of heat and electricity, as well as by its important property of practical insolubility in acids.

Asbestos has been found in all quarters of the globe. It comes from Italy, China, Japan, Australia, Spain, Portugal, Hungary, Germany, Russia, The Cape, Central Africa, Canada, Newfoundland, this country, and from South and Central America. The asbestos generally found in the United States, especially in Virginia, the Carolinas, and Texas, also in Staten Island, New Jersey and Pennsylvania, is in appearance like fossilized wood. The veins range in length from a few inches to several feet.

Notwithstanding this wide distribution of asbestos, the only varieties which at present appear to demand serious consideration from a commercial point of view are the Russian, the South African, the Italian and the Canadian. The principal claim possessed by the Russian fiber to a place in this quartet is based on the enormous extent of the deposits which have been discovered in east Russia, beyond the Ural mountains, and Russian Siberia. So far, their specimens have been of comparatively poor quality. The yield is used almost entirely in Europe, where it is mixed with the Canadian for spinning, making paper, and other purposes where an inferior grade can be utilized.

As a matter of fact, Canada contains the great asbestos region of the world, in the sense that while its mines are practically unlimited in productive capacity, the product is of a quality which fully meets the requirements of the newest and most exacting of the innumerable uses that are daily found for it.

One of its special uses is for wall-plaster. This is a new application which will have a distinct effect in modifying the practice of indoor plastering. Instead of the tedious and elaborate preparation of studs and strips, and the use of inferior and dust-creating mortar, with its after-scoring, which is necessary to give adhesion to the final coat of plaster of paris, a single coat of the asbestos is laid on. It has a glossy surface which will not crack, as, while firm, it is perfectly flexible. It can be put on the raw brick; and a room of which the walls have been built in the morning can, before night, have a smoothly finished interior surface, shining like glass and as hard as a rock. A kindred application of asbestos is now coming into vogue in the shape of uninflammable decorations for walls and ceilings. These are used a great deal for the saloons of steamships.

Firemen clad in asbestos clothing and masks, as are those of London and Paris, can walk through the hottest flame with comparative impunity. Asbestos fireproof curtains have reduced the mortality of theater fires to a very appreciable degree.

Probably one of the first applications of asbestos in this country was to roofing. To buildings covered with this material the shower of sparks from a neighboring conflagration involves no danger. The fact that woodwork can, by its use, be made uninflammable has come to be an important factor in the insurance of buildings. One of the largest branches of asbestos manufacture is that of sectional cylinders for pipe coverings, for retaining the heat of steam and other pipes, felt protective coverings for boilers, frost-proof protections for gas or water pipes, and cement felting, which can be laid on with a trowel, for the covering of steam pipes, boilers, or stills. In some of these cases, where it is only necessary to retain the heat, the asbestos is mixed with other substances; but where the protection must be fireproof as well, only asbestos is used.

Another very extensive department in asbestos manufacture is that of packings. Of these there are an infinite number of forms. The making of asbestos paper varies from the building up of the thickest millboard to the production of a writing paper which, from its indestructibility, is invaluable in case of fire for preserving charters, policies, agreements and other important documents. To the electrical engineer asbestos is absolutely indispensable.

A considerable part of an asbestos factory is devoted to weaving, the asbestos being first drawn into thread for that purpose. Here again is an apparently endless diversity. There is the fireplace curtain blower and filtering cloths for many purposes, from straining molten metal to clarifying saccharine juices in beet sugar refineries. A cloth is made for straining and filtering acids and alkalies in chemical laboratories. The filter can be thrown into the fire, and after the residual matter has been consumed the web is as good as new. For filtering purposes generally asbestos has a unique adaptability, and in tropical countries it is held in grateful estimation as a cooler and purifier of water. The newest departure in the asbestos field is the construction of electrothermic apparatus. The heating effect of the electric current is utilized by embedding the wire in an asbestos sheet or pad. Another application of the same principle is to car heaters.

[The increasing use of asbestos gives importance to its occurrence in California. It is found in many localities in the mining counties, frequently of excellent quality. It is being mined to some extent, the production being taken by factories in San Francisco. Prices about $30 a ton are obtained.—ED.]

The Nicaragua Canal.

The report of the Committee on Interstate and Foreign Commerce to the House of Representatives, recommending the financial aid of the Government in the completion of the Nicaragua canal, has been issued from the Government Printing Office. The committee say that the advantages to be derived from the construction of this great interoceanic waterway are so vast, that the canal should be built, even though the cost of construction exceed the figures of the Board of Engineers. In their opinion, the Government should assist the company in the completion of the work, even if it costs over $150,000,000; but if, as they believe, it can be constructed for about $100,000,000, so much the better. The canal should be built as a matter of national need.

ON one of the Northwestern railways, running from Minneapolis to Sault Ste. Marie, the firemen are hired, not by the company, but by the engineers. The plan has been tried for a year and a half, and the officers are so well pleased with it that they think of trying it on the trainmen. The conductors ultimately may be allowed to select their own brakemen.

Electrolytic Treatment of Low-grade Auriferous Copper Ores.

Dr. Mulholland, of Bathurst (N. S. W.), proposing a new process for the treatment of low class of ores explains the main features of the proposed treatment as follows: The ore, being finely ground, is at once leached with a hot solution of cupric chloride in a rotating barrel, through which a slow alternating current of electricity is passed. The cupric chloride solution is mixed beforehand with a saturated solution of calcium or magnesium, chloride, or salt, so that the combined action, chemical and electrical, extracts all the copper from the ore. The clear solution is run through a barrel containing copper oxides or hydrates, which remove all iron and similar impurities from the solution, leaving it only pure copper. The copper solution is now passed into rectangular vats containing porous asbestos partitions, with electrodes for conveying the current to the solution as it passes in the vats. The copper is deposited, and the solution is pumped back to a reservoir for treating more stuff. Once the solution is made it lasts indefinitely, a little water being added to make up for evaporation, and a little chemical to supply losses by leakages, etc. Thus there is no cost after the preliminary charges, except for fuel for the engines required for crushing, working the dynamos, pumps, etc. The process is circular, and, under good management, extremely economical. Thus the copper is saved, and as the average market price is £40 per ton it will pay with even a one per cent ore, and lower, for its own extraction. The ore, being freed from copper, and chemically disintegrated, is in an excellent condition for treatment by cyanide or other suitable method. If there are silver sulphides in the ore they are dissolved, and are precipitated before the copper, so that the silver deposit may be stripped from the cathode before the copper is allowed to deposit, or it may be separated by chemical means.

STOPE BETWEEN THE 800-FOOT AND 900-FOOT LEVELS, INDIANA MINE, NEVADAVILLE, GILPIN COUNTY, COLORADO. (*See page 45.*)

ONE of the marine curiosities recently fished from the bottom of the Indian ocean by a dredging vessel in the employ of the Calcutta Society of Natural History was a mammoth sea crab, which continually emitted a bright white light, similar to that seen in the spasmodic flashes of phosphorescent luminosity, kindled by our common fireflies. The oddity was captured in daytime and placed in a large tank, nothing peculiar except its immense size being noticeable in the sun. At night, however, the crab surprised the naturalists by lighting up the tank, so that all the other sea creatures occupying the same tank could be plainly seen. When the luminous crustacean was prodded with a pole, he emitted flashes of light which enabled the experimenters to read small print, even though otherwise they were in total darkness.—St. Louis Republic.

Electrical Progress.

Electrical Advance in Railway Transmission.

In the issue of the MINING AND SCIENTIFIC PRESS of July 4th appeared the following paragraph:

Chief Electrician Heft of the New York & Hartford Railroad ran an electric car at the rate of eighty miles per hour over a tangent between Nantasket Beach and Hull, Mass., last Saturday.

This deserves more extended notice, as it was the first time in the history of railroads that the main line of a surface steam railroad has been operated by electricity taken from a conductor laid upon the ground, as the Nantasket branch, inaugurated just twelve months ago, was the first steam road in the world to which electricity was solely employed as the motive power.

While the third rail system for electric roads is not new, it being in use on the West Side & Lake Street Elevated Railway in Chicago, the rail being set outside the track, this is the first instance of a third rail being laid upon the permanent way of a trunk steam road, between the rails of the service track. The preliminary work was carried out at the Schenectady works of the General Electric Co.

The current for the third rail section is brought from power house No. 1 on the Nantasket line over two insulated feeders of copper cable laid along the tops of the poles which carry the overhead wires of the Nantasket line. At the Nantasket Junction station the feeders are dropped to the ground, and each is connected to its own third rail.

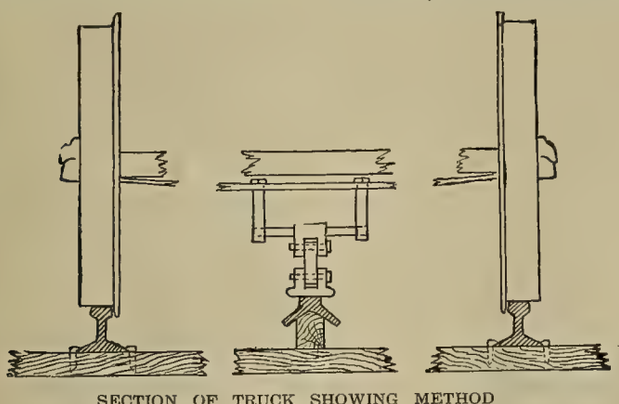
The third rail is of peculiar shape—the end-view resembling a flattened A. It is laid midway between the two service rails of each track. Each section of third rail is 30 feet long and weighs ninety-three pounds to the yard. It is supported by three ash blocks to each section, the blocks being set into the ties. Before use these blocks are boiled in vacuum pans with a tar compound, and thus each pore is filled with insulating and preserving material. The insulation is almost perfect. The continuity of the third rail circuit is secured by attaching each end of one rail to that of the next by means of two heavy copper bonds.

PART OF THE NANTASKET BEACH LINE, SHOWING OVERHEAD TROLLEY AND EXPERIMENTAL PIECE OF TRACK LAID WITH THIRD RAIL: THIS SHOWS THE COMPARISON BETWEEN THE TWO METHODS.

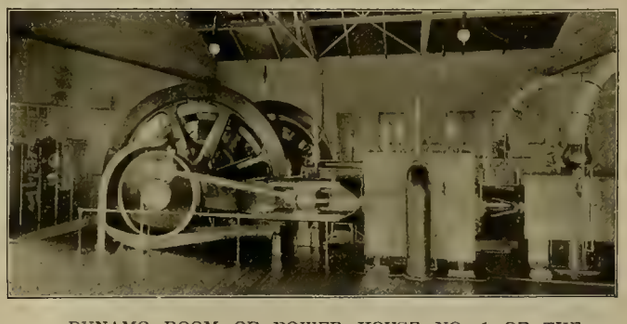
CAR ON THE RAIL MOVED BY THIRD RAIL CONTACT.

The electricity is taken from the third rail by two sliding shoes hung loosely from the car, one suspended between the axles of each truck immediately under the king pin by two links, which allow it to slide easily over the top of the third rail and make perfect contact with it all the time. The current is brought to the motors through the controllers and circuit breakers, and returns to the track rails by the wheels. The continuity of the return circuit is secured by using a short, thick bond of copper cable to join together the ends of each pair of track rails, the ends of the bond being fastened into the flange of the rail. The distance between each of the two shoes on the car is 33 feet. No third rail is laid at the crossings, the circuit continuing between the broken end by means of lead-covered cables. At the crossings less than 30 feet wide one of the shoes is always in contact; at wider ones the impetus of the moving car brings the shoes into contact again before the car can come to rest.

The baggage cars in use last year, each equipped with four motors, have been abandoned, and the large sixteen-bench open cars are alone employed as motor cars or locomotives. Sixteen of these cars will be put into service, each equipped with two General Electric 2000 motors, two series, parallel controllers, two automatic circuit breakers—the safeguards from accident to the rest of the electrical apparatus—and an air pump and motor for the compressed air for the whistle and brakes. The air pump combination is automatic in its action. As soon as the pressure in the main air tank falls below ninety pounds to the square inch a small knife switch is closed by a spring, and the motor starts. The switch is forced open by the air pressure as soon as that in the tank reaches the normal.



SECTION OF TRUCK SHOWING METHOD OF CONTACT.



DYNAMO ROOM OF POWER HOUSE NO. 1 OF THE N. Y. N. H. & H. R. R.

Electric Power at a Colorado Mine.

An interesting description was recently published in these columns of the electric power transmission installation at the Virginius mines of the Caroline Mining Company at Ouray, Colo.

This was one of the first power transmission plants installed in this country and its operation since its installation in 1891 has been continuous.

The Virginius mines are situated near the summit of Mount Sneffles, in a region of perpetual snow, some 12,700 feet above the level of the sea or 5,000 feet above the timber line. They consist of some mines rich enough to repay mining under the most adverse circumstances and of others containing a low grade of ore which could not be mined profitably without cheap power. This power is derived from the water of the Red Canyon creek, which is brought through a pipe line 4000 feet long to Pelton wheels which drive G. E. bipolar dynamos. The transmission line passes first through dense timber, then over rocks and chasms and heavy snowdrifts until it reaches the mine four miles away from the power-house. The current is direct and the voltage 800 volts. The motors drive hoists, pumps, blowers, stamping mills, drills, and an order has recently been given the General Electric Company, which put in the original plant, for an 800-volt, 2-motor mining locomotive.

Access to the mines in winter is impossible and in summer extremely difficult, and before the adoption of electricity the Caroline Mining Company was paying $18 a ton for its fuel, the expense of this item amounting to over $100 a day. Mr. A. E. Reynolds, the manager, recently said: "Probably the most forcible way in which I can explain the advantage of this plant is to state that without it, it would be impossible to operate the mines, as our expenses would be prohibitory."

Scientific Progress.

How Electricity Manifests Itself and What it Can Do.

A. E. DOLBEAR.*

It may be well to point out at the outset what has occasionally been stated, but which, in my judgment, has not received the philosophical attention it deserves, namely, that electrical phenomena are reversible, that is, any kind of a physical process which is capable of producing electricity, electricity is itself able to produce. Thus, to name a few: If mechanical motion develops electricity, electricity will produce mechanical motion; the movement of a pith ball is a simple case. If chemical action can produce it, it will produce chemical action, as in the decomposition of water and electroplating. As heat may be its antecedent, so will it produce heat. If magnetism be an antecedent factor, magnetism may be its product. What is called induction may give rise to it in an adjacent conductor, and, likewise, induction may be its effect.

Let us suppose ourselves to be in a building in which a steam engine is at work. There is fuel, the furnace, the boiler, the pipes, the engine with its fly-wheel turning. The fuel burns in the furnace, the water is superheated in the boiler, the steam is directed by the pipes, the piston is moved by the steam pressure, and the fly-wheel rotates because of proper mechanism between it and the piston. No one who has given attention to the successive steps in the process is so puzzled as to feel the need of inventing a particular force, or a new kind of matter, or any agency, at any stage of the process, different from the simple mechanical ones represented by a push or pull. Even if he cannot see clearly how heat can produce a push, he does not venture to assume a genii to do the work, but for the time is content with saying that if he starts with motion in the furnace and stops with the motion of the fly-wheel, any assumption of any other factor than some form of motion between the two would be gratuitous. He can truthfully say that he understands the *nature* of that which goes between the furnace and the wheel; that it is some sort of motion, the particular kinds of which he might make out at his leisure.

Suppose once more that, across the highway from this engine house, there is another building, where all sorts of machines—lathes, planers, drills, etc. —are running, but that the source of the power for all this is out of sight, and that one can see no connection between this and the engine on the other side of the street. Would one need to suppose there was anything mysterious between the two—a force, a fluid, an immaterial something? I am asking the question on the supposition that one was not aware of the shaft that might be between the two buildings, and that it was not obivous on simple inspection how the machines got their motions from the engine. I think no one would be puzzled because he did not know just what the intervening mechanism might be. If the boiler were in the one building, and the engine in the other with the machines, he could see nothing moving between them, even if the steam pipes were of glass. If matter of any kind were moving, he could not see it there. He would say there *must* be something moving, or pressure could not be transferred from the one place to the other.

Substitute for the furnace and boiler a galvanic battery or a dynamo; for the machines of the shop, one or more motors with suitable wire connections. When the dynamo goes the motors go; when the dynamo stops the motors stop; nothing can be seen to be turning or moving in any way between them. Is there any necessity for assuming a mysterious agency, or a force of a *nature* different from the visible ones at the two ends of the line? Is it not certain that the question is, how does the motion get from the one to the other, whether there be a wire or not? If there be a wire, it is plain that there is motion in it, for it is heated its whole length, and heat is known to be a mode of motion, and every molecule which is thus heated must have had some antecedent motions. Whether it be defined or not, and whether it be called by one name or another, are quite immaterial if one is concerned only with the *nature* of the action, whether it be matter or ether, or motion or abracadabra.

Once more: suppose we have a series of active machines. An arc lamp, radiating light waves, gets its energy from the wire which is heated, which in turn gets its energy from the electric current, that from a dynamo, the dynamo from a steam engine, that from a furnace and the chemical actions going on in it. Let us call the chemical actions *A*, the furnace *B*, the engine *C*, the dynamo *D*, the electric lamp *E*, the ether waves *F*.

The product of the chemical action is molecular motion, called heat in the furnace. The product of the heat is mechanical motion in the engine. The product of the mechanical motion is electricity in the dynamo. The product of the electrical current in the lamp is light waves in the ether. Nobody hesitates an instant to speak of light waves as forms of motion, for they are described as undulations in the ether at right angles to the direction of the radiation. No one hesitates for an instant to speak of the heat as being molecular motion, nor of the motions of the engine as being mechanical; but when we come to the product of the dynamo, which we call electricity, behold, nearly every one says, not that he does not know what it is, but that no one knows! Does any one venture to say he doesn't know what heat is, because he cannot describe in detail just what goes on in a heated body as it might be described by one who saw with a microscope the movements of the molecules? If any body of any magnitude moves, it is because some other body in motion and in contact with it has imparted its motion by mechanical pressure. Therefore, the ether waves at *F* imply continuous motions of some sort from *A* to *F*. That they are all motions of ordinary matter from *A* to *E* is obvious, because continuous matter is essential for the maintenance of the actions. At *E* the motions are handed over to the ether, and they are radiated away as light waves.

A puzzling electrial phenomenon has been what has been called its duality—states which are spoken of as positive and negative. Thus, we speak of the positive plate of a battery and the negative pole of a dynamo, and another troublesome condition to idealize has been, how it could be that, in an electric circuit, there could be as much energy at the most remote part as at source. But, if one will take a limp rope, 8 or 10 feet long, tie its ends together, and then begin to twist it at any point, he will see the twist move in a right-handed spiral on the one hand, and in a left-handed spiral on the other, and each may be traced quite round the circuit; so there will be as much twist, as much motion, and as much energy in one part of the rope as in any other; and if one chooses to call the right-handed twist positive, and the left-handed twist negative, he will have the mechanical phenomenon of energy distribution and the terminology analogous to what they are in an electric circuit. So far, there is no trouble; but one can see the rope as a whole twisting, and nothing can be seen in an electric conductor. Are not the cases more dissimilar than the mechanical analogy would make them seem to be?

(To be Continued.)

* Journal Franklin Institute.

THE amount of loss suffered by coal from exposure to the weather is considerable—far greater, indeed, than is generally known. The results of recent analyses show in some cases a total loss in weight from this cause amounting to 33.08 per cent, while the deterioration in quality for purposes of fuel or gas making reaches a still higher figure.

Mechanical Progress.

The Coming Boiler.

From an address before the Boilermakers' Association, Cleveland, by G. B. Hartley, of Philadelphia, the following abstract is taken:

The era of high pressure is here, and the limit has already been reached in the construction of the old types of steam generators. This fact is presenting itself to the boiler manufacturers, many of whom are yet fighting the battle, born of prejudice, against the water tubular types. Much of this is no doubt due to the imperfections of design and use of cast iron parts of many of the more prominent of the pipe boilers now in the market. The fact that this is true furnishes additional encouragement for boiler makers to turn from their old types to the making of the more perfect sectional boiler that engineering now demands not only for stationary purposes, but for marine uses. It is in this latter service that the limit has arrived. Instance the boilers of the St. Louis and St. Paul, as well as those on the vessels of our new navy. Think of the immense weight of boilers from 15 to 17 feet in diameter when filled with water. It is unnecessary to speak of the loss of so much valuable space taken up by the eight or ten of these immense generators. The shell plates are of $1\frac{9}{16}$ inch thickness, which, with their diameter, permits of a pressure of 200 pounds per square inch. Neither weight of metal nor skill and strength of workmanship required in the construction of these types will permit this thickness to be exceeded. Thus we have reached the maximum on shipboard. We therefore have four immediate reasons for development and adoption of a water tubular boiler for marine uses: 1, To obtain less weight and space; 2, less first cost and less cost of repairs; 3, economy of operation in development of high pressure; and lastly, reducing the dangers of the present explosive boilers to a minimum.

In turning to stationary boilers a wider field of choice is presented for higher pressure. The horizontal return tubular type, with its limit of diameter and thickness of shell, must be abandoned and the internally fired and water tubular designs be adopted. As a fact there are so many heat units in a pound of coal; how to impart this heat to the making of steam is the problem. It seems that the internally fired boiler, properly designed so that steam making heat is not wasted in the chimney, is the solution, as, of course, the boiler will be properly covered by non-conducting material. Again, this type possesses the advantage of a large disengaging service and plenty of steam space, and can be built to carry a working pressure as high as there will ever be necessity for.

The water tubular boiler must lose considerable by reason of brickwork setting, which latter must be kept in good repair to prevent cold air from sucking through the cracks, while the disengaging service in the steam space in the design to date is believed by many engineers to be their weakest feature.

Another reason for the passing away of the old types, and one which causes much objection also, applies to the internally fired boiler. This is the cost of repairs. When an inspector finds a defect in these boilers it necessitates half rims, new sheets in fire box, etc., making it necessary to take tubes out to do the work properly. This not only increases the actual cost of repairing the boiler to a considerable amount, but consumes just so much time that the manufacturing plant must remain idle. If it were a water tubular boiler, all sections of which can be duplicated at short notice, the savings here would prove more by far than the additional first cost of the latter type. It is for these reasons that our boiler manufacturers must revolutionize their business—not for the sake of the economy of fuel, but for the sake of higher pressures and for economy in keeping in repair.

A CHANGE of practice, which is simplifying and increasing the useful work of machinery, is the displacement of the belt transmission of power in favor of direct connection of the motive power and machine. This has largely been made practicable through the improvement in electric motors and the development of the high-speed engine. It has also become the usual practice in electric light and power plant installation where water is the motive power. The suggestiveness of the results obtained has not been lost on the mining engineers, where water is available under high pressure. Water lends itself to the same effective economic divisibility as electricity, and in many mining plants of recent construction, instead of the power from one water wheel being transmitted by belt and shafting to stamp batteries, rock-breakers, concentrators, fans, hoists and pumps, each machine has its own water-wheel, direct-connected, except in the case of the stamp battery, where one belt is frequently all that is necessary to make the proper reduction in speed. This system of water power application, besides doing away with the numerous belts, shafts and pulleys and saving the power required to meet their frictional losses, makes possible a saving in initial construction of building framing and a direct saving in water consumption, by reason of most of the operations about a mining plant being intermittent. The water is shut off when not being used in useful work and cumulates rapidly into dollars where water is purchased by the cubic foot or inch. In another equally efficient way the saving in water made renders it possible to use water power where its use would otherwise be impracticable by reason of the shortness of the supply.

Practical Information.

How Poisons Act.

Carbolic acid produces immediate vertigo and intoxication, with burning pain along all points of contact. The breathing becomes stertorous and the pupils of the eye contract.

Phosphorus in overdose produces irritation and disturbance over every part of mucous it touches, and the contents of the stomach when removed are luminous as is phosphorus.

Prussic acid is the most rapid of all poisons, killing like a stroke of lightning. A teaspoonful of 2 per cent prussic acid will kill. In a few seconds after the liquid is taken the face turns bluish and the person sinks to the floor.

Opium, morphine and the like produce a period of exaltation, followed by stupor, which merges into death.

Strychnine is followed by convulsions; the head jerks back and the body rests on the head and the heels, arched like a bow. These spasms come intermittently till death.

THE following is a simple rule for the approximate determination of the cubic contents of a proposed reservoir construction to be made by building a dam across a valley suitable for use for that purpose: Multiply the flooded surface area of the proposed reservoir in square feet by two-fifths of the maximum depth of water proposed. This will give the content in cubic feet. Divide by 2300 to get the content in miners' inches.

IF it be a fact that murderous deeds are done in cold blood, the proper time for such sins should be between 11 at night and 1 in the morning, for it is in this interval that the temperature of the human body falls to its minimum. Healthy beings go regularly through a daily cycle of variable warmth. The maximum heat is reached at 9 A. M., when in persons under 25 the temperature stands at 99° Fahrenheit, and this is maintained until 6 P. M., when it slowly and steadily falls till an hour before midnight; the amount of decrease by this time is something over 2°. At

about 3 A. M. the upward turn is taken and the heat increases till 9 o'clock. It is curious that this extent of change only occurs in young bodies, for old people preserve a nearly equal degree of warmth all the twenty-four hours through. Other notable facts are that eating and drinking have nothing to do with the variations, and that hot and cold baths do not appear to interfere with the regularity of the successive changes.

COLORS excellently adapted to the cheaper kinds of painting can be made by employing coal tar instead of oil as a vehicle. Coal tar paints cover a larger surface by one fourth than an equal weight of oil colors, require no varnishing and dry very quickly. They may be applied on fresh plaster, damp walls, cement, wood or metal, and moreover possess disinfecting properties, due to the carbolic acid they contain.

A SIMPLE characterization of the difference between anthracite and bituminous coal is practically in the amount of volatile substances that can be driven off by the application of heat; thus, anthracite coal contains from 5 to 10 per cent of volatile matter, the remainder being carbon and ash, while bituminous coal has from 17 or 20 up to as high as 36 per cent.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAME APPARATUS.—R. M. Nachmias, San Francisco, Cal. No. 563,507. Dated July 7, 1896. This invention relates to a game, and consists of cubical blocks having pictorial representations upon their sides, and in conjunction therewith of a series of cards, each card having a figure upon it, corresponding with one of the figures upon the block. Thus the pictures of a number of horses may be printed upon the sides of the blocks, and a corresponding picture of each horse upon one of the cards. The cards will be distributed to as many people as may desire to play in the game, and the blocks or dies being then thrown, whichever one comes uppermost wins, so that a number of famous horses may be pictorially represented, and the result of a race between the horses will be shown by the winning figure upon the block.

ADJUSTABLE HINGE AND WINDOW LOCK.—Robert R. Strain, San Francisco, Cal. No. 563,430. Dated July 7, 1896. This invention relates to sash hinges and locks, and particularly to a device which is especially adapted for use in connection with window sashes so that a hinge connection may be readily made and broken between the sash and its frame, thus allowing the sash to swing inwardly about its hinge connection so that the outer surface can be cleaned without danger. The device also serves as an effective lock. It consists of a main leaf secured to the stile of the window sash, or to the window casing, having a recess formed in its center, a second and smaller leaf corresponding in size and shape with the recess of the main leaf and adapted to fold therein so that the surfaces are flush when the leaves are closed, a smaller leaf having an open slot in its lower edge and a stop over which the slotted end of the smaller leaf is detachably fitted when the leaf is turned outwardly to form a hinge connection between the sash and its casing. This leaf may also be turned outwardly when the sash has been closed so as to engage a stop upon the casing and thus form a lock to prevent the sash being raised.

CAR COUPLING.—John C. Look of San Jose, Cal. No. 563,389. Dated July 7 1896. This coupling belongs to that class in which the locking device is adapted to be raised, to uncouple, by a rock-shaft extending to the side of the car. The object in view is the provision of means for connecting the lever on the car with the locking device in such a manner that said connection shall maintain itself in a substantially vertical line between the locking device and the lever; and to this end the whole device consists of a lever mounted on the car, with its inner extremity substantially over or under the locking device of the coupling, to which is attached a rod or device connecting with the locking device, said rod or device being flexibly connected to both the lever and the locking device, and so arranged, as by being slidable in an eye in the device, or an eye in the lever on the car or at any convenient place, as to allow and accommodate itself to all the movements of the coupling or locking device.

TRY-SQUARE.—Emerson S. Farley, Pomona, Cal. No. 563,465. Dated July 7, 1896. The object of this invention is to provide a small, convenient and portable instrument for the purpose of obtaining the bevels most used in all regular-pitched roofs and adapted to be carried about on scaffold-work with ease, requiring no adjustments, being always in readiness without the use of setting mechanism or thumb-screws. The device consists of an ordinary try-square, having on the opposite faces of its blade, levels or scores extending in lines, which converge to the extremity of the inner corner of the handle of the square and representing the bevels of regularly-pitched roofs, and other lines or scores extending diagonally across the blade from the ends of the first-named lines and at right angles thereto, and representing the foot or bottom cuts of the rafter.

ATHLETE'S SUPPORTER. John J. Pfister, of San Francisco, Cal. No. 563,408. Dated July 7, 1896. This is a supporter especially intended for the use of wheelmen. It belongs to that class of supporters having a tight cross band passing between the legs, and is an improvement upon the same inventor's prior patent No. 452,529 of May 19, 1891, the improvement consisting in the means for holding the cross band flat and straight, and preventing it from becoming compressed or drawn into a stringy shape and chafing, as it is liable to do in bicycle riding under the pressure of the saddle and the invariable movement of the legs. The supporter, as a whole, consists of an elastic waistband, a tightly-fitting cross band secured thereto and adapted to pass between the legs, and short annular leg bands secured around their top edges to the lower edges of the waistband and to the adjacent side edges of the cross band, whereby the latter is held flat and smooth.

Commercial Paragraphs

A. F. TOWNSEND, vice-president of the Manhattan Rubber Mfg. Co., of 64 Cortlandt street, New York, has bought from H. G. Blasdel the patents and good will of the Blasdel Jr. Concentrating Belt Co. and will continue the manufacture.

THE Vulcan Iron Works of San Francisco are building a double circular sawmill for McLean Bros. of Redding, Cal., and a portable sawmill for the Red Cap Mining Co. of Hoopa valley; also, a ten-ton ice-making plant for Hawaii and a five-ton refrigerating plant for Central America.

THE Joshua Hendy Machine Works have just issued the fourth edition of their catalogue (No. 3) on "Specialties of Hydraulic Mining Machinery." The catalogue, in addition to the usual hydraulic tables and rules, gives some very practical data from the actual operation of hydraulic elevators. The catalogue will be mailed on application to anyone sending in their address to the Joshua Hendy Co., 42 Fremont St., San Francisco, Cal.

GEORGE W. KNEASS, the well known boat-builder of this city, has recently completed two coffee lighters for Ocos, Central America. They are 46 feet long, 13 feet beam and 6 feet deep. He has also just delivered to the Government life-saving station at this port two life-boats—one self-righting. This establishment has probably built more steam and gas engine launches within the past twenty-five years than all the other builders on the coast. His racing boats, skiffs, yawls, sailboats, yachts and lifeboats may be found upon nearly all the waters of the globe. Wherever the name "Geo. W. Kneass, Builder," is found stamped or branded on the rail or transom of a boat, it means high-grade in all respects. The works and salesrooms are at 718 Third street, with large shops also at the Potrero.

Recently Declared Mining Dividends.

Jackson Mining Co., Eureka district, Nevada, 15 cents per share, payable July 20th.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper.

California Enterprise.

Factory: Novato, Marin Co. California.

A Large, Valuable Mining Property For Sale CHEAP.

Situated within the Rich Mineral Belt

OF NEVADA COUNTY, CALIFORNIA.

From Emigrant Gap, C. P. R. R., distant in a northerly direction by wagon road eight miles, and consisting of nine full claims of 1500x600 feet each; all heavy veins from 2 to 10 feet wide, one 20 feet. One of which is patented; balance possessory title perfect, with sufficient development done upon six of the unpatented claims to entitle owners to patent. But one of the group has been operated by the present owners; this one (the Last Chance) is now being developed and the ore mills from $2.50 to $102.50 per ton, free gold, and has from the start to present time yielded a net profit of 20 per cent over total running expense. CAUSE FOR SELLING—The company has no capital, therefore the property is too large for us to handle satisfactorily. Would sell a part or all; would prefer to sell an undivided one-half. Price $18,000 cash; or for the whole, price $40,000 cash; or would give a working bond, price $60,000, 20 per cent cash. Also three other distinct groups, all situated within the same belt and county, one of which consists of six full claims 1500 by 600 feet, patent applied for; another of four full claims, one patented; and still another of three claims, unpatented, all large, heavy veins. Included in the last named three groups are four mines that were worked quite extensively 25 to 40 years ago and have an A1 record; one yielded an average of over $40, another over $30, and two more over $20 per ton free gold. Will sell one mine, one group or two groups. Will give purchaser pick and choice. This is an unprecedented opportunity for mining men of capital to secure a valuable property at a reasonably small figure. Come and look at it. No triflers or middlemen without positive backing need apply. For further particulars, please address S. B. FOWLER, Maybert, Nevada County, California.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

HOME MANUFACTURE.

THE POOR MAN'S MILL AND ENGINE:

THE ..... DANIEL BEST CRUDE OIL .. ENGINE. . . . .

CAPACITY,
2 to 200
HORSE POWER.

The Cheapest Power Known;

Invaluable Where Fuel is Scarce.

The most economical motive power ever invented, costing but 10 cents per H P. per ten hours run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

THE ..... KINKEAD QUARTZ MILL.

The Kinkead Quartz Mill will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine, to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

Price of Mill $1,000, f. o. b. San Francisco, including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole Mill. This Mill can be made in 300 lb. sections, if desired, at extra cost. Send for Catalogue.

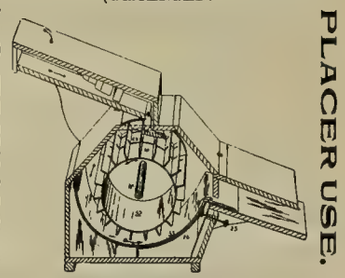
(PATENTED.

FOR MILL OR PLACER USE.



Greatest GOLD-SAVING MACHINE Ever Invented.

It will come nearer saving every color of free gold than any gold-saving device made up to the present time. Whether the gold is fine, flake or flour, its work is perfect. The only machine that works the black sands of the ocean perfectly, saving the fine flake gold contained therein. Our machines are now running on beach sand and on tailings from some of the best mills in California, and they are working successfully. We give guarantee with each machine. In working over old tailings from a stamp mill that contains free gold, amalgam and quicksilver, this machine has no equal. Send for catalogue and particulars. Manufactured only by the **VICTOR AMALGAMATOR CO., 703 S. Main St., Los Angeles, Cal.**

PAYNE'S

PATENTED

GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

1710 Champa Street, DENVER, COLORADO.

☞Would sell an interest to right party.

Santa Rosa and Sonoma, Cal., are to be connected by an electric railway.

There are 900 men employed on Mare Island, and the force will be increased to 1500 by August.

The Union Iron Works will build one of the two Japanese cruisers to be constructed in this country.

—Natural gas is showing increased quantity in the Los Angeles oil wells. At some of the wells it is used for fuel.

No one who employs Chinese can lawfully use the trade mark of the Manufacturers' and Producers' Association.

A townsite, known as Oil City, has been located at the new oil wells nine miles north of Coalinga, Fresno county.

The San Francisco District Land Office reports that during the last half year only six timber land entries were made.

The Santa Fe Co. is extending its tracks from Redondo to San Pedro. The new construction will be about ten miles.

Work is being done at several points on a road which will connect Weaverville, Trinity county, with Eureka, Humboldt county.

—At Summerland, Santa Barbara county, the flow of the oil wells averages about five barrels of a heavy oil to each well daily.

Sonora, Tuolumne Co., is to have an ice plant capable of producing six tons daily and storage for 10,000 cubic feet. Estimated cost, $15,000.

The 129 gold, silver and bronze medals awarded California exhibitors at the recent Atlanta Exposition have been received by the successful exhibitors.

—The two breaks in the Mokelumne and Campo Seco ditch have been repaired and the water turned in again, enabling the mines dependent on it to start up again.

—Suisun is to have a municipal water system. The proposition to issue bonds for $42,000 has been carried and it is intended to have the water in before winter.

—A brewery and ice plant are to be established at Hermosillo, Sonora, by J. H. Schuele of San Antonio, Texas, and A. H. Hoeffer of Clifton, Arizona. About $70,000 is to be invested.

The oil production of California increased from 705,969 barrels in 1894 to 1,208,482 barrels in 1895, an increase of 71 per cent, the largest percentage increase of any of the States of the Union.

The extremely low rates by land and sea between this city and Portland, Or., will end next Tuesday, when the old passenger tariff will be approximated. It is probable freights will follow.

—The assessment roll of Sacramento county shows an increase for the city of Sacramento of $942,071, and a decrease in county outside of the city of $397,036. The total roll amounts to $18,562,075.

—The Mexican consul at this city, A. K. Coney, wants bids for an electric light plant, 600 arc and 1500 incandescent, under an eight years' contract, the contractor to furnish all the apparatus.

—It is proposed to drain the lower Colusa basin—an area of 70,000 acres—by the construction of a canal thirty miles long, from Long Bridge to Knights Landing. The canal is to have a width of a quarter of a mile and a depth of seven feet, giving a flow capacity of 12,000 cubic feet per second, sufficient to clear the basin of the accumulation of hill waters having no direct outlet to the Sacramento river, the local rainfall, seepage and overflow from the river. The cost, exclusive of the cost of land necessarily used, is estimated at $550,000.

—On the 11th the S. P. Co. cut the weekly working time of its 4000 shopmen on the roads west of El Paso to five days, laying them off Saturdays. The cause is stated to be economy, necessitated by decrease in business during the summer months.

—The Washington and Idaho Railway, between Spokane, Wash., and the Coeur d'Alenes, Idaho, 150 miles, was sold under foreclosure at Tekoa, Wash., last Monday, to the reorganization committee of the Oregon Railway and Navigation Company for $1,615,740.

—The success of the Chino beet sugar factory is encouraging the early establishment of additional factories in that locality and elsewhere in the State. Negotiations are said to be nearly complete for the establishment of another factory near the ocean in Los Angeles county.

—The rate war, so far as passenger traffic is concerned, has been temporarily ended by an agreement between the Oregon Railway Co. and the Southern Pacific to advance rates to figures nearly double those of the last ten months, but not as high as before the war started. The railroad is to continue its special train on steamer days.

—The Committee on Management of the Home Products Exposition, to be held in the Mechanics' Pavilion, in this city, Sept. 1st to Oct. 3d, '96, have issued a prospectus of the twenty ninth Industrial Exposition of the Mechanics' Institute, which will be confined exclusively to the products of the Pacific coast, under the auspices of the Mechanics' Institute and the Manufacturers' and Producers' Association of California, which says: "This exposition will differ from any held heretofore, as the display will be confined exclusively to the manufactures and products of the Pacific coast. It is believed that an exposition of purely Pacific coast manufactures and products will result in great good and will be the means of bringing the consumer and manufacturer or producer into closer relationship. There never has been an exposition of this exclusive character held in San Francisco and the great variety and superior quality of a full and complete display of the articles manufactured or produced on this coast will be one that will prove a gratifying surprise to the people. It is intended to make the exposition the most instructive and interesting one of the kind ever held in San Francisco. A special feature will be in making it a vast factory wherein the public can witness the process of manufacture of almost every article exhibited. Looms will be at work making cotton, woolen and silk goods. Machinery will be in operation showing the manufacture of gloves, shoes, ladies', children's and gentlemen's wearing apparel, India rubber goods, jewelry, furniture, electrical appliances, etc. Printing and book binding will be shown, as also the preparation of food products, the making of confectionery, perfumes, extracts, etc., besides which will be displayed marble and stone work, mining, agriculture and dairy machinery, etc. It is expected to make the fine arts display an exceptionally fine one, consisting of paintings in oils and water colors, engravings and etchings, black and white, pen and ink, and other drawings and sculpture. Special efforts will be made to make an exceptional fine display of the works of the citizens of the Pacific coast." Applications for space should be forwarded to Carl H. Clark, agent Mechanics' Institute, 31 Post street, or S. H. Tacy, manager Manufacturers' and Producers' Association, room 2, sixth floor, Mills' building. The pavilion will be open for the reception of exhibits on August 17, 1896. Mechanics' Institute—E. A. Denicke, president; E. P. Heald, rec. secretary. Manufacturers' and Producers' Association—Horace Davis, president; Lewis R. Mead, secretary. Committee on Management—(Mechanics' Institute)—Grove P. Ayers, E. H. Cole, P. J. Healy, Rodney Kendrick, Oscar Lewis (chairman), Geo. R. Presson; (Manufacturers' and Producers' Association)—W. F. Bowers, H. J. Crocker, S. H. Tacy.

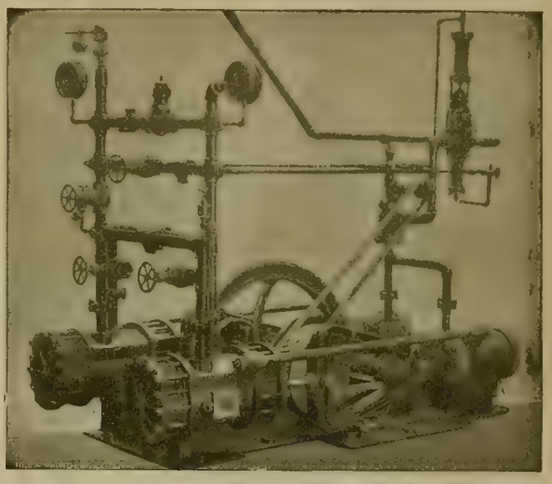
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

HOITT'S SCHOOL FOR BOYS

At Burlingame, San Mateo County, Cal., is one of the most thorough, careful and practical "Home Schools" to be found on the Pacific coast. It prepares boys for any university, technical school, or for active business; is accredited at the State and Stanford Universities, and under the able management of Ex-State Superintendent Ira G. Hoitt, Ph. D., ranks among the first schools in the United States.

628 Sacramento Street.....San Francisco.

You Can Get $s for Cents!

CRIPPLE CREEK

Is producing $1,000,000 per month, and the output is steadily increasing and making fortunes for investors in mines and stocks. The CRIPPLE CREEK AND CALIFORNIA GOLD MINING & MILLING COMPANY OF SAN FRANCISCO are rapidly developing their group of mines, located on Little Bull mountain near the city of Victor, in the gold-bearing belt of the greatest gold camp in the world.

A LIMITED NUMBER of the shares of the treasury stock will be sold for the purpose of development at the price of Ten Cents per share. The par value is One Dollar, and under the laws of Colorado are absolutely non-assessable.

For prospectus and full particulars call or address E. B. MYERS, Secretary, Room 30, 139 Post Street, San Francisco.

A DAY'S SHIPMENT OF CABLE-ROAD ROPES, BY JOHN A. ROEBLING'S SONS CO., TRENTON, N. J.

THE accompanying illustration gives a good idea of the daily output of an American manufactory where a good deal of "what draws the world together" is made. The firm of John A. Roebling's Sons Co. deserves a high place in mercantile mention in the quality and quantity of wire rope and cables produced, with the world for their market. The main office and works are at Trenton, N. J., employing nearly 2500 men. Mr. S. J. Mooney is in charge of the San Francisco branch at 25-27 Fremont street. The company counts the number of miles of wire rope and wire cable it has made by the tens of thousands, and, as with all forms of fence wire, telegraph wire, etc., its trade mark is a guarantee of reliability. The recent great activity in electrical work has given recognition by practical experience to the high conductive power of the Roebling wire, which has been an important factor in the extension of the electric transportation system in this and other countries.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The Argonaut shaft, Jackson district, is now 1400 feet deep, without a station or any other excavation. A station will now be cut at 1350 feet, leaving a 30-foot sump, and as soon as the drifts and cross cuts are far enough from the shaft to make working there safe, sinking will be resumed. The first objective point of the Argonaut people will be to reach their north lines and the disputed ground between them and the Kennedy.

Record: At the Central Eureka shaft, at Sutter creek, the water is lowered 350 feet below the mouth of the shaft. For 125 feet the timbers had to be replaced, but from there down they are found to be in perfect condition.

Butte.

Times: The English Syndicate has commenced opening the Wilson mine on Magalia ridge. This mine adjoins the Princess and is known to be very rich.

Calaveras.

Citizen: The Nighthawk mine, situated in San Andreas, has been bonded to C. W. Getchell. Suitable machinery will be erected and work commenced before the 15th instant.

The Marshall gravel mine, situated near the County Hospital, is being operated by Chicago parties. From 15 to 20 men are employed.

Dispatch: The shaft at the Gwin mine is down 1290 feet. A station will be cut at the 1300-foot level and a cross-cut run to the ledge. Sinking will be resumed as soon as the station is completed and continued to the 1450-foot level.

Del Norte.

Journal: In mining circles in this county there is considerable activity. Murray and Christensen have bonded their Low Divide copper claim for $6000. Wenger, Murphy, Darby and others have bonded the old Union mine for $20,000. The tunnel in the Oranna gold quartz claim on Bald Hill is now completed and ore being taken out. The placer claims on French Hill, Craig and Coon creeks, and Rattlesnake Bar, are reported to be paying.

El Dorado.

(Special Correspondence). — Work on the Pocahontas, 8 miles south, is progressing. The shaft has been retimbered and the mill is ready for operation. New hoisting and pumping machinery will be on the ground in a few days.

The Star Light mine, a mile from the Pocahontas, will soon be ready for work. The pipe line and reservoir are finished and the mill nearly so.

On the Lone Star, 5 miles south, drifting from the shaft is showing a fair prospect.

Bryant & Kœrner have located a claim adjoining the Manzinita Queen, 4 miles south of town, and have begun shaft work.

E. Bind and some Eastern capitalists have bonded two claims 8 miles north of Placerville, from Davey & Burton, and are sinking a 300-foot shaft.

Articles of incorporation were filed last week with the County Clerk for the Salisbury Mining Company with a capital stock of $400,000. There are $300,150 subscribed as follows: M. Salisbury, 5 shares; W. H. Crawford, of Chicago, 15,000 shares; Albert W. Longley, of Chicago, 15,000 shares; Chas. F. Irwin and George M. Clark, of Placerville, each 5 shares. The gentlemen named are the directors for the ensuing year.

The tramway on the Boulder mine, 16 miles southwest, is almost finished. It is 1500 feet on the level and 1100 on the incline. It is solidly constructed and topped with steel rails. The 10-stamp mill will be completed and running about the 1st of August.

There is much activity in both gravel and quartz mining in the Fairplay district 25 miles east of Placerville.

El Dorado county's mining properties are beginning to attract attention from abroad. Capital finds a good opportunity here for remunerative investment. A development organization would find this a profitable field. No less than ten capitalists, Californian and Eastern, were in Placerville the past week examining properties in various portions of the county.

Placerville, July 13th, 1896.

Herald: The Zantgraf quartz mine, near Newcastle, has 60 men on the pay roll. The 20-stamp mill runs continually. The four concentrators produce a ton of sulphurets per day.

Nevada.

Union: A quartz mine has been discovered on the McKeon ranch which promises well. The ledge is about 2 feet wide, shows free gold and is heavily mineralized.

C. G. Fisk brought down from Fall Creek a collection of fine nuggets from the Ogdensburg and Laurence mines. They range in size from a hen's egg to a pea and are of all shapes. The mines have been producing handsomely for some time past and the gravel keeps getting richer as progress is made.

Herald: D. Harmon, superintendent reports the California in God's Country running in full blast, but the German in Washington has been shut down for the present. He says they have plenty of ore in German but it is low grade and the expense of mining and milling consumed the profits. It is Mr. Harmon's intention to put in a plant, with power drills, etc., and then he believes he can mine and mill for about $2 per ton.

Union: At the Lone Ridge mine, near Blue Tent, the ledge has been tapped through the tunnel, in about 190 feet. The vein varies from four to five feet in thickness and the rock is of good character.

The *Tidings* says: Can Africa beat it? There are twenty-two gold mines in Grass Valley district that have been worked for forty years—some steadily, others to a depth of 150 to 500 feet, others 900 and 1000 feet and one 2150 feet vertically. This group of gold mines extends from the old Mobile (now the Diana) over to the Cambridge and Lucky mines. What fabulous sums of money have been taken from these mines! Only five are now being worked, and no work has been done on some for twenty to thirty years, as they have been closed for want of capital to go deeper. Capitalists would hardly invest in a gold mine over 400 feet deep in the earlier days, yet this group of gold mines has in forty years yielded over $35,000,000 in gold. Of those closed none stopped because the veins or quartz failed. The ore and veins are there to-day as they were left years ago. The fabulous amount of gold produced shows how rich these mines are. They can and will be worked to a great depth. In depth, permanency and production, South African mines are hardly to be compared to this only one of Nevada county's mining districts.

Placer.

Sentinel: F. Schultz is building a stamp mill on a mine supposed to be an extension of the Herman mine, on Deadwood divide.

The lower tunnel at the Pioneer quartz mine, near Towle, now in 750 feet, will strike the ledge 510 feet below the present working tunnel. Twenty-eight hundred feet of tunnel will be required.

(Special Correspondence). — The Horsehoe Bar Con. M. Co. is building a ditch—capacity of flow 2500 inches—from the north fork of the middle fork of the American river, crossing El Dorado canyon on a bridge, five miles long to the Horseshoe Bar mine. The water will be used under 400 feet head in elevators. A mile of the river channel is kept free of river water by a tunnel run several years since through Horseshoe bend, and the mine is to be worked without the usual winter shut down on account of high water.

At the Gray Eagle mine, Forest Hill, the mining of gravel below the tunnel has been discontinued. A water power hoist and pump are being put in to work the mine through the old incline, through which the first work was done in the channel.

Plumas.

(Special Correspondence).—Greenville, population 250, is in Indian Valley, about twenty-two miles north of Quincy. The principal mines are as follows:

McGill & Standart, G. Standart superintendent, is two and one-half miles south of Greenville. They have two veins which run east and west, pitch north, and are from 4 to 14 feet thick. This mine is worked by three tunnels—No. 1, 600 feet; No. 2, 2000 feet; No. 3, 1300 feet—the present workings being in Nos. 2 and 3. The ore is free milling, and yields about $8 per ton. They have a 15-stamp water power mill, employ 18 men and extract and crush 30 tons of ore daily.

The mine of the Round Valley Con. M. Co., a corporation, is two miles south of Greenville, on North canyon. There are five ledges, three of which are worked. On these ledges there are two tunnels, 500 feet and 1400 feet, both in ore; 200 feet of new tunnel is being run. Only development work will be done this year. They have a 10 stamp water power mill, not running now.

The Hibernian quartz mine, owned by J. O'Toole, leased to B. F. Gullick & Co., is one and one-half miles southeast of Greenville. The ledge bears northwest and southeast and pitches southwest between granite hanging-wall and slate and porphyry footwall. The ledge is a mixture of quartz and porphyry, 26 feet thick. The lessees own a 10-stamp water power mill, one mile from the mine. The mine is being developed through five tunnels, 40, 100, 300, 350 and 450 feet. The ore is very low grade, but there is lots of it. From a mill test of 90 tons it paid $2.50 per ton. Ten men are employed.

The Hibernian Extension mine, No. 1, south of and adjoining the Hibernian, is owned by J. Duncan, C. H. Hook, C. L. Robinson and B. F. Gullic. This mine has two ledges, on which there are three shafts, which show ore averaging 18 inches in thickness. Active work is soon to begin on this mine, which is at present idle.

The Jewel quartz mine, about 600 feet from and parallel with the Hibernian Extension No. 1, is owned by B. F. Gullic & Co. They have a considerable width of low-grade ore that goes about $3 per ton. This mine, at present idle, is to be prospected this fall.

The Alpine quartz mine, owned and managed by B. F. Leete, is one-half a mile southeast of the Hibernian. The ledge runs northwest and southeast and pitches southwest between granite hanging wall and slate and porphyry footwall. The ledge is from 8 inches to 5 feet thick, and pays about $15 per ton. The development consists of a 100-foot shaft with whim hoist and a tunnel now in about 100 feet and in 200 feet more to cut the ledge 100 feet below the present shaft workings. Sixteen men are employed.

Taylorville is another town in Indian Valley, twenty-two miles northeast from Quincy.

The Morton gravel mine, owned and managed by W. B. Morton, is eighteen miles northeast of this place, in what is known as Lights canyon, and consists of forty acres of an ancient channel, worked by hydraulicking. Water is brought in by two miles of ditch and flume and used by one monitor and 800 feet of pipe. The season for mining in this section is short, seldom lasting over the four months, from March 1st to July 1st. There are three or four other companies prospecting in the same vicinity, reports from which are very encouraging.

The Lucky S. gold mine, owned by Mrs. L. Wegener of San Francisco, is eleven miles northeast of Taylorville. J. E. Remick is superintendent. This property consists of four claims and ledges, the general direction of which is north and south. They average about three feet thick. Improvements are a steam hoist and a 5-stamp, water-power mill. A shaft is down nearly 300 feet, and there are several tunnels. The ore runs about seven per cent sulphurets. Nine men are employed, and ten tons of ore mined and milled daily. The superintendent states that mill tests have paid $22.50 and $31.75 per ton.

The Engels copper mine, owned by Engels Bros., is located fourteen miles northeast of Taylorville. This property consists of 3000 feet of lode claimed to be 30 feet in width.

Butte Valley, population 250, is situated about fifty miles northeast of Quincy, near the center of the Dutch Hill mining district. The principal mines in this locality are: The Sunnyside drift gravel mine, two miles south, J. F. Cummings, superintendent. This mine has recently been sold to the Sunnyside Mining Co., a Boston corporation. The ditch, half a mile long, brings water from Clear creek. The gold from this mine is very coarse. At present twenty men are working. The Swiss mine, adjoining the Sunnyside on the north, is also a drift gravel mine, owned and operated by B. Pizzoni, who is working seven men. The Dutch Hill, owned by Savarcool Bros., is a drift gravel mine, two and one-half miles east of Butte Valley. It is developed through two tunnels, one 1200 the other about 800 feet long. Four men are working. In 1877–78 $250,000 is said to have been taken out of this mine.

The Big Flat mines, located three miles east of Butte Valley, are as follows: The Scott, owned by I. E. Scott, a drift gravel mine, is worked through a tunnel, in 250 feet. F. Scott is superintendent and employs seven men. The channel of this mine, like others in this district, is underneath 500 feet of lava.

The Cameron on the same channel, adjoining the Scott on the north, is owned and operated by A. Cameron. At present 13 men are employed but the force is to be increased. The Glazier, owned by A. D. McMillan & Co. is operated by Dr. J. P. Welch, under bond. Six men are employed and the yield is about $5 per day to the man. Crescent Mill, eighteen miles north of Quincy, is a quartz mining locality. The Green Mountain, Geo. P. Cornell superintendent is half a mile west of the town. The principal ledge averages about 20 feet thick. Development is being made through two tunnels; one about a half a mile, and the other nearly a mile long. There is a 60-stamp water power mill on the mine. The ore is low grade and free milling, but there is plenty of it. The Green Mountain has been a large producer but is temporarily idle.

L. P. McC.

National-Bulletin: J. A. Murphy and associates are doing well in their river bar claim on the east branch. They can work the year round.

J. B. Eva and associates have begun prospecting the Golden Gate mine, west of Quincy.

San Diego.

Sentinel: The Owens mine shipped one and a half tons of sulphurets to San Francisco this week.

The mines of the Rice mining district are all being worked, and one of the main things the camp now needs is the building of a mill to handle the ore close at hand.

A strike in the Golden Crown mine, one of the Golden Cross Company's group, is reported.

In the 300-foot stope there is now uncovered, between 7 and 8 feet in thickness and about 40 feet in length, a vein of very rich ore. Selected samples from it assayed $170, and an average sample, taken from top to bottom of face, assayed $58.50.

The indications are that this ore chute crops on the surface some 450 feet from the point where it has been opened in the 300 stope.

Sierra.

Messenger: The hydraulic mine at Eureka cleaned up about 510 ounces, the result of a four months season's run.

Siskiyou.

Journal: At the Mabel mine, on the divide between Oak Bar and Scott Bar, Chamberlain & Timmons are busy making arrangements to erect a mill. The rock heretofore has been crushed in the Columbia mill at Mill creek.

The mines on Thompson creek and vicinity, with the exception of the Seattle Placer Mining Co.'s mine, have been compelled to close down for the want of water.

Work on the Woodland or Garrett mine, on the Klamath, near Scott river, is progressing nicely. Some delay was caused in putting in part of the cribbing, the water being much deeper than was expected.

A number of small river wheels are being built along the Klamath, with which it is intended to elevate water for working rich spots along the banks of the stream.

Some miners on the Klamath river paid $2.50 each a day for the privilege of working with rockers on the mine across the river from the Seattle Placer Mining Co. property. This agreement was soon terminated by the owners, as the men were rocking out $10 a day each.

The owners of the Fort Gough mine, in Scad district, became discouraged and closed down their property. The Wood Bros., who are practical miners, offered to take the mine and work it, giving the owners one-third of the gross proceeds. They made but a short run, as the water gave out, and cleaned up $1875.

Reporter: The Nebraska mine, on Cherry creek, owned by H. B. Warren and Charles Bonhart of Yreka, has been leased to M. F. Means and Thomas Elliott.

Journal: It is reported that F. Beaudry started up a small giant at the head of Wild Cat Creek and in ten days cleaned up about eighteen pounds of gold—nearly $5,000.

Trinity.

Free Press: The Altoona shaft is now 400 feet deep.

Mr. Lawler, superintendent of the Integral mine, has commenced work. He will put 20 to 30 men prospecting and sinking new shafts and developing.

The Strode brothers at Trinity Center are running their 5-stamp quartz mill. A strike has been made in the Bonanza King mine, owned by Vollmers, Fillman & Ellery, and men are at work getting out the ore.

Journal: J. H. Smith exhibited some rock this week in which gold was visible. It came from one of his ledges on Steuart's Fork, which is from 26 to 50 feet in width, on which he is running a tunnel. The rock will average $8 per ton.

Journal: The Altoona Company employ 140 men and 30 are employed by the contractors in getting out wood and timber for the mine. They are putting up new buildings and other improvements. The new furnace and other machinery are to be put in.

At the Nash placer mine, on Coffee creek, the Trinity gold placer mining syndicate are driving a tunnel 8x8 feet and 125 feet in length, to get an outlet and dump for hydraulicking. They are running other drift mines three miles above and employ 40 men.

Tuolumne.

(Special Correspondence). — Considerable mining activity prevails in this district and at Groveland and Big Oak Flat.

At the foot of Priest's Hill the Wheeler Hill Gold Mining Company of Glasgow, Scotland (F. H. Hill, superintendent), is developing on the mother lode.

At the Never Sweat, Captain J. Ballantyne continues taking out the rich rock which was struck just before the 4th.

The Longfellow mine at Big Oak Flat is reported sold to Santa Clara capitalists.

Adjoining the Longfellow is the Mack mine, owned by Mack & Co. of San Francisco. It is one of the oldest mines in the district, having been located in 1854 and worked intermittently since. It is well equipped with a steam hoisting plant and produces ore that mills from $15 to $20 a ton.

At the Two Brothers and Wheeler mines, H. H. Todd, superintendent, work is being done in two of the old tunnels.

The Belcher Gold Mining Co. Ltd. of London, F. H. Hill, superintendent, is preparing to reopen the Belcher mine, about one mile from Groveland.

At Mount Zion, near Groveland, a shaft is being sunk. There are six men employed.

The Slap-jack mine is worked under bond by Argall Bros., Emerson and Griswold. The shaft is down 40 feet on a vein that shows free gold and is said to assay $35 per ton.

Priests, July 13, 1896.

Independent: Messrs. Bluett & Gale, who are mining on leased ground at Jackass Hill, took $540 out of a pocket on Saturday.

C. Fish has sold his interest in the Mapes quartz mine at Yankee Hill to W. L. Wilson. The owners will complete the mill and in two or three weeks begin crushing ore.

Superintendent H. Wilmans of the North Star mine reports the water used in operating the mine as running very low, and that next week the company expect to put in steam for the remainder of the dry season.

Union-Democrat: At the Rawhide the ore coming from the lower or 1000-foot level is milling higher than the average above. The ledge looks stronger and better defined.

At the Jumper the new 20-stamp mill has started up

OREGON.

Tribune: E. P. Jennings, in an interview says, that in the last two years considerable interest has been taken in the Bohemia district, which is about 160 miles south of Portland, in one of the west spurs of the Cascade range. A Wisconsin company put up a 10-stamp mill last fall, and this year they propose to increase the plant by installing a 20-stamp mill, with concentrators and cyanide plant for treating the tailings.

The ore is free milling on top, but soon becomes base with iron pyrites and is easily concentrated. From experiments that have been made it has been found that the ore is easily and cheaply worked by cyanide, and on this fact the future of the district depends, for the ore is low grade, and transportation charges are so high that shipping concentrates is out of the question. The country rock is syenite, and is cut by heavy porphyry dykes carrying the quartz veins, which vary from a few inches to twenty feet in width, and are, as a rule, well mineralized.

The elevation of the camp is about 5000 feet. It is reached by wagon road and trail from Cottage Grove, a station 40 miles distant on the Southern Pacific. The advantages of the country are that it is well wooded and watered, veins good-sized and easily worked, labor and supplies cheap.

The disadvantages are the great amount of snow in winter and the bad roads, which make the freighting of machinery a very serious and expensive undertaking.

WASHINGTON.

Spokesman-Review: The Gold Hill Mining Company was incorporated at Colfax, with $1,500,000 capital stock, for the purpose of developing mines in the Jerome creek mining district.

At the Lone Star and Washington claims, White's camp, the tunnel is now in over 80 feet, for the last 50 feet in high-grade ore, carrying copper, gold and silver, which is of a nature easily treated, either by matting or concentrating.

Outlook: Work has been resumed on the Ivanhoe group of mines on Palmer mountain. It is the intention of the company to extend the shaft to the 200-foot level, and at that depth to determine the value and extent of the ore deposit. On the surface the ledge was rich in native and ruby silver.

BRITISH COLUMBIA.

Advance: Copper mountain lies south of the Similkameen river, and is at the head of a small tributary known as Wolf creek. Upon the mountain are several mineral claims, isolated until the extension of the Columbia and Western Railway is made to Hope. Assays of ore taken from these claims have run up to 37 per cent in copper and $27 per ton in gold.

The veins are between granite and diorite formations, with limestone between. The veins are from a few inches to several feet in width. Development work is being done on the Vancouver by Messrs. Miller and Saunders, the owners. Ore croppings are traceable for 7500 feet and across the ledges for a width in some places of 200 feet.

Journal: On the South Fork of the Quesnelle, the California Consolidated Company have had a successful season's work.

On the North Fork the Cape Horn Dam Company have closed down, waiting for low water so as to replace their dam, which was carried out.

The Meathers, Moore and Black Bear drift properties are being worked and are steady producers. It is reported that they will be consolidated and worked by hydraulicking.

Kootenaian: The Wonderful, near the Slocan Star, upon which work was begun a few weeks ago, has commenced shipping ore from float, the ledge proper having not yet been struck.

Tribune: The following were the ore shipments from Ainsworth during the week ending Thursday, July 2nd:

No 1 mine	to Everett 20 tons concentrates, value	$1100
Sunlight,	to Everett 10 tons ore, value	450
Nonsho	do 10 tons ore, value	300

On the Tuesday Climax, at Rossland, the lead has been traced throughout the length of the claim. A shaft is down 12 feet, in mineralized rock, 2½ feet being solid ore. This claim is 1500 feet west of the Homestake.

An important strike has been made on the Great Western. At a depth of 40 feet in the new shaft a body of chalcopyrite shipping ore, the full width of the shaft, was uncovered.

On the Deadman a strike has been made at the 200-foot level, in a drift to the eastward. The thin streak of ore widened into about 9 feet of vein matter, 4 feet of it galena, assaying 300 oz. silver and $11 gold.

Spokesman-Review: A large ore contract has been signed by which the British Columbia Smelting and Refining Company, of Trail, B. C., are to have the entire output of the War Eagle, Iron Mask, Virginia, and probably the Poorman mines, from July 1 to January 1, 1897, a period of six months. The same company has also contracted for the product of the Crown Point. At this mine there are 300 tons of shipping ore on the dump.

The returns from the first car of ore shipped from the Mayflower mine to the Tacoma smelter have been received at the local office. The ore shipments went $56 a ton, and are the best returns yet made from any property on the south belt.

IDAHO.

Spokesman-Review: D. Rand and two partners cleaned up $4,000 from their placer mine in Pierce City district this season.

At the Kincannon or Granite mine on Granite creek six miles east of Murray, the ledge continues to widen out and the rock grows richer as the exploration is continued. The ore is of much the same nature as that nearer Murray, except that it runs more galena. A pocket was recently discovered from which an assay of a fair sample showed 56 ounces to the ton.

Spokesman-Review: The Hecla, at Burke, is working three shifts sinking its shaft, now down 60 feet. At the 80-foot level a station will be made and three more shifts set to drifting. Good ore is being taken out of the shaft. From the trend of the ledge of the Standard, it is supposed to cross the creek either on the Hecla or the Oreornogo (Ore or no go), both of which ship ore. The Hecla ore is similar to that in the Standard nearer the surface.

The new ore bins of the Standard are still going up. A large bulkhead is being built to hold the rock taken out of the Campbell tunnel. The new tunnel is now in about 2100 feet, about 2700 being required altogether.

UTAH.

The Mercur *Mercury* says of the ore being opened up in the Sacramento mine that the limits of the deposit have not been determined. The new deposit above the old workings is a strong one, and the ore averages from $10 to $20 per ton. Below the main tunnel 45 feet another tunnel is being run, also on a large ore body. The mill is running regularly, saving 85 or 90 per cent. It is the intention of the owners to at least double the capacity of the plant, the changes to be made some time next month or the first of September. At present it takes only fifteen men to operate the mine and mill. The miners break the ore by contract at so much per ton.

The threatened litigation between the Hillside and Sacramento companies, involving a conflict embracing about ten acres between the Hillside, Hillside Nos. 2 and 3, owned by the Hillside Co., and the Excelsior, owned by the Sacramento people, has been compromised, the disputed ground being divided.

Tribune: Advices from the Grasshopper at Marysvale say three feet of ore in the main workings, twelve inches of it going at $75 a ton. The property is being developed through three tunnels at present.

At Mercur, the Sunshine mill is to be enlarged immediately, and the mine output of ore increased to 150 tons daily.

MONTANA.

The *Inter-Mountain*, writing of Butte, says: The eyes of all mining men in this section are at present turned in the direction of the Park Canyon district, which is about two miles east of the city. They are watching the development on the Northwestern Company's ground, which comprises six claims adjoining each other. The company has a bond on these claims and will practically demonstrate whether or not there are large bodies of rich copper-silver ore beneath the capping in that vicinity. The two-compartment shaft through which the Northwestern Company will explore that mineral zone is now down 45 feet and will be sunk 500 feet. The property is situated near the mouth of the canyon and is considered as good as any thereabouts. With the exception of Con Sullivan's Homestake, no great depth has ever been attained on any claim in that neighborhood, and as the surface indications are similar, if not exactly alike, to those of the Anaconda and other great copper properties on this side of the flat, the prospects for opening up a good body of ore in Park canyon are flattering. It would appear as though Silver Bow county is possessed of a mammoth mineral zone shaped like a dumbbell, with the Anaconda hill as one bulb, the Park Canyon hill the other and the ledges crossing the valley the connecting bar. A vast sum of money has already been spent in an endeavor to demonstrate the value of Park canyon, but most of it has been squandered in driving tunnels instead of sinking below the oxidized capping. Another reason why the rich and extensive bodies of ore which are supposed to lie hidden below have not been exposed is the tenacity with which claim owners there have held to their ground. A mining company, as a rule, does not care to take hold of a single claim and chance thousands of dollars in developing it alone, for by so doing owners of adjoining property would be getting something big for nothing. In the case of the Northwestern Company, however, the claims are together.

Inter Mountain: Operations will be resumed at the Potosi Company's property near Pioneer, about 60 miles northwest of Butte. Near the surface the ore is gold-bearing, but as depth is attained a good percentage of copper is obtained. Several tunnels have been driven on the veins, but so located that no depth was reached. The company now proposes to run another tunnel at a point that will give a foot in depth for every foot driven into the hill. The work is to be carried on along the course of the vein about 500 feet.

SOUTH DAKOTA.

Times: C. B. Coon of California has leased the Morton lode, on the Blacktail divide. The Morton is one of the group owned by M. Carroll and has produced a large amount of ore. Several chutes are exposed in workings stopped by influx of water.

The D. and D. smelter has stopped receiving custom ores, excepting from the Bonanza and one or two others with whom the smelter has contracts. There are several thousand tons of ore in the yard, and the management desire to clean up the surplus before receiving any more custom ores. The company will hereafter operate more of its own mines and treat its own ore, having properties that can nearly or quite supply the plant at its full capacity.

Development work on the Yankee Boy property, situated in Carbonate camp, is being steadily carried on. The ore chute recently struck is now 5 feet wide and from 2½ to 3 feet thick. The ore has an average value of $32 per ton.

The new mining camp known as Pringle, on the line of the B. & M. Railroad, is becoming a lively place since the advent of Messrs. Pettibone, Dorrington and associates, who have purchased an interest in the Gray Copper group of mines. The old workings on the property show the vein to be 60 feet wide, 40 feet of which is said to average $108 per ton in gold, silver and copper. Development work will now be pushed. A shaft to be sunk on the vein 100 feet is now under way.

Dacey & Seck, owners of four claims near Ragged Top, adjoining the Murray Madill ground, are gathering up ore from the surface of their claims which has an average value of $76 gold per ton. This float consists of boulders weighing a pound to half a ton.

COLORADO.

Investor: The Nelson tunnel at Creede was started something more than three years ago for drainage and transportation purposes. It is one of the largest tunnels ever projected in Colorado, being 10 feet high by 12 feet wide, with a double track. Its construction was an absolute necessity in order to permit the working of the properties on Bachelor mountain. The Amethyst and United mines have been hoisting 1000 gallons 1000 feet per minute, yet, during a great part of the time, the pumps have not been able to keep the water out of the way sufficiently to permit the working of the lower levels. The tunnel, when completed, will tap the veins 1500 feet below the surface and will save an expense for pumping of more than $1000 per day, and nearly half that amount for hoisting and transportation. It was intended to drive the tunnel 9000 feet farther, in which case all of the more important mines on Bachelor mountain will be drained, but during the past few months the difficulty in securing the money necessary for the expense of the tunnel interfered very materially with the progress of the work, and very little work has been done. As a result of negatiations carried on by B. R. Wallace, Mr. A. B. Overholt secures a large block of the stock of the tunnel company, and will furnish the money necessary for the further prosecution of the work.

Silver Lance: The Inez Gold and Silver Mining Company at Gunnison is making 4 ft. a day advance in its tunnel. It is 47 feet into the contact vein and the hanging wall is still in front of the breast. The company may conclude to drift on this vein, provided it does not find rich ore just under the hanging wall. The nature of the formation is favorable for ore.

Record: The secretary and treasurer of the Union Gold Mining Co. at the annual meeting reported that during the life of the company the gross production has amounted to $362,883.88, of which $232,913.53 has been produced by lessees and the remainder by the company. The production during the past twelve months amounted to $189,540.90, and during the same period $45,615.46 was paid in dividends. The total dividends paid by the company amount to $82,755.37. There still remain in the treasury 83,093 shares and the sum of $7613.19 in the bank, with $12,134.34 due from the smelters for ore. The president's report to the stockholders concludes as follows: "Not more than one-fourth of the ore exposed in the present workings has been extracted, and shipments from the deepest point yet reached show high values."

Mail: The High Five, one of W. S. Stratton's Plymouth Rock group of mines, on Ironcap hill, now being developed by a prospecting tunnel that cuts the formation at right angles just under the wash, is reported to have passed through a vein of good ore, running better than five ounces.

ARIZONA.

Miner: On the Surprise, which lays on the east side of the Agua Fria, the shaft is down 65 feet, the ore body widening with depth. From this shaft 150 sacks of ore that will run $209 to the ton are ready for shipment, and there are about 70 tons more of milling ore on the dump that will run $20 a ton. On the Gold Note, distant about one-half a mile from the Surprise, the shaft is down 80 feet, with a 12-foot crosscut at the bottom, all in ore. Samples assay from $12 to $16 per ton free. These mines lie about forty-five miles southeast of Prescott and four miles east of Bumblebee station.

Sentinel: Mr. Luce and another gentleman purchased the tailings of the old El Rio quartz mill, 5 miles below Yuma, and estimate there are about 800,000 tons. Assays show that they contain $5 in gold per ton. They figure that $1.50 per ton will cover the expense of treating them by the 20-ton cyanide plant they have built.

From Pearce 120,000 pounds of ore daily is sent to El Paso for treatment. About 45 men are at work in the mine.

Oasis: Reports from Congress mine say that from the workings above 700 feet depth, one hundred tons a day are mined and milled, averaging $20 a ton in gold from refractory looking pyritic ores. A cyanide plant is working 100 tons of tailings daily at a profit.

Silver Belt: The Rain Gold claim, owned by E. J. Edwards, a mile and a half from Webster Springs, in Gila county, is making a very promising showing. Fifty feet down, the ledge is strong, with two feet of ore assaying $60 to $70 in gold. B. Round owns a claim on the same lead, on which he has a tunnel 138 feet in ledge matter 40 feet wide which averages $5 per ton in gold.

The *Silver Belt*, writing of the resumption of work in the Old Dominion copper mine, says: The mine is in first-class shape for the production of ore, the various stopes on the several levels looking well, and no difficulty is anticipated in supplying all the ore required when the new furnaces are in operation. A steam sinking pump, with a capacity of about 600 gallons per minute, is now in place in the shaft and everything will be in readiness within a short time to resume sinking. The three-compartment shaft has been completed from the bottom, forty feet below the eighth level, to the surface—440 feet. At present two cages are operated in what were formerly the old compartments. The other compartment furnishes an outlet for the steam and exhaust pipe from the pumps, and it is the intention later to equip this compartment with a counterbalance cage for the transportation of the men, timber and tools. Among the more important of recent additions to the plant are three horizontal tubular boilers, 5x16 feet, installed at the hoisting works, and a new boiler house.

LOWER CALIFORNIA.

H. Johnson, at Socorro, has built a ditch twenty miles long, investing $15,000 in the work, which developed 250 miners' inches. His placer ground will run 60 cents per yard.

MEXICO.

Oasis: The Las Planchas mine, Sonora, continues to improve with extension of the development work. An adit being run to enter the shaft 140 feet down is in good ore all the way, but until it is finished the latter cannot be used below 60 feet. At that depth, however, ore is being extracted and a carload shipped monthly. The mill will be running by August 1st.

Personal.

W. H. STORMS is in Placer county.

JOHN HAYS HAMMOND is in London.

R. H. CAMPBELL is in British Columbia.

PROF. JAS. E. MILLS of Plumas Co. is in Mexico.

E. B. PRESTON of the State Mining Bureau is in Butte county.

SUPT. T. T. THOMAS of the Gwin mine returned from New York last week.

D. M. BURNS has returned from Mexico, where he has been at his Candalaria mine.

H. V. CROLL is now superintendent of the Denver Engineering Works, Denver, Colorado.

R. RECKNAGEL, manager North Pole mine, Baker Co., Or., has returned from London, England, and will build a stamp mill and do considerable development work this season.

GEN. DUFFIELD, head of the Coast Geodetic Survey, has gone to Alaska to gather information regarding the disputed Alaskan boundary. He expects to return to San Francisco in October.

J. H. NEFF, president of the California Miners' Association, has resigned as a member of the State Board of Prison Directors, business requirements making it almost impossible to give that position the time required.

J. MCNALLY, late superintendent of the Virtue mine, Baker City, Or., last week as his last official act brought in $22,000 the result of a twenty days' cleanup. He has turned matters over to his successor, J. B. Risque, and will make his future home in San Francisco.

Assessment Notices.

MARGUERITE GOLD MINING AND MILL CO. Location of principal place of business San Francisco, California. Location of works Yuba and Nevada Placer mines, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 18th day of June, 1896, an assessment No. 1 of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room 3, 120 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of July, 1896, will be delinquent and advertised for sale at public auction and unless payment is made before will be sold on FRIDAY the 28th day of August, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS WINTERS, Secretary.

Office, 325 120 Sansome St., San Francisco, California. Office hours from 10 to 12 M.

BEST AND BELCHER MINING COMPANY. Location of principal place of business San Francisco, California. Location of works Virginia City, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 3d day of July, 1896, an assessment (No. 99) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 20, 409 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of August, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 27th day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. J. AFFE, Secretary.

Office, Room No. 53, Nevada block, No. 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 5) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of July, 1896, an assessment (No. 4) of Two cents (2c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of August, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 21st day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C GODFREY, Secretary.

Office, Room 38 Crocker Building, San Francisco, California.

DELINQUENT SALE NOTICE.

NIMSHEW GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Nimshew, Butte County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the Fifth (5th) day of June, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
D. Gutman, Trustee	19	500	15 00
D. Gutman, Trustee	20	500	15 00
D. Gutman, Trustee	21	500	15 00
D. Gutman, Trustee	22	250	7 50
D. Gutman, Trustee	23	250	7 50

Wm. Matson	122	2,000	60 00
Wm. Matson	142	5,000	150 00

And in accordance with law, and an order from the Board of Directors, made on the 5th day of June, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, Mission Street Pier No 1, San Francisco, California, on MONDAY, the 3rd day of August, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

C. D. COOK, Secretary.

Office, Pier 1, Mission Street, San Francisco, California.

ANNUAL MEETING. The regular Annual Meeting of the stockholders of the North Pacific Mining and Transportation Company will be held at the office of the Company room 5, No. 632 Market St., San Francisco, California, on Monday, the seventeenth (17th) day of August, 1896, at the hour of 1 o'clock p. m. for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Wednesday, August 12th, at 3 o'clock p. m.

E. D. PARISH, Secretary.

Office—Room 5, No. 632 Market street, San Francisco, California.

Professional Cards.

HERBERT LANG,
Mining and Smelting Engineer,
Albany Hotel, Oakland, Cal.

WADE & WADE,
Analytical Chemists and Assayers.

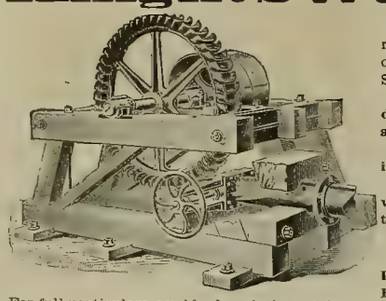
Knight's Water Wheel.



The accompanying cut shows the general arrangement of **Knight's Standard Water Wheel,** of which there are **hundreds in use** in different States of the Union.
These Wheels are made from **2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.**
Wheels inclosed in iron cases, from 6 to 24 inches.
Wheels for electrical power can be furnished **with or without Governors. Highest regulation guaranteed.**

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Draper's Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

NOTICE TO ORE SHIPPERS.

By shipping your ores to us you can obtain the highest prices paid on competitive bids in the public market, together with a careful and accurate sample, as with our new mill and improved machinery we are able to give perfect satisfaction to all shippers. *Write for our Pocket Reference Book.* The highest cash price paid for gold bullion and old gold. Prompt returns.

DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.

LIMITED.

TRADE MARK.

MacArthur-Forrest Process.

CAPITAL, £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

The Kendall system is covered by patents which this company will defend.

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

Owners of mines and reduction works can obtain full information on application to

KENDALL GOLD AND SILVER Extraction Company,

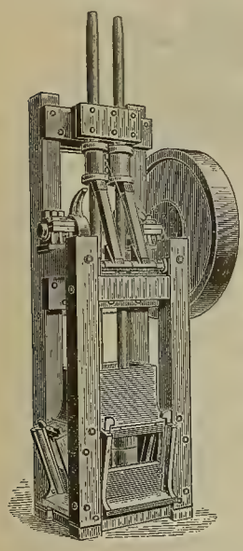
MINING AND MILLING MACHINERY.



"HENDY" IMPROVED
TRIPLE-DISCHARGE
Two Stamp Mills.

Superior to all other Mills of the same form for the following reasons:

First. Because **Two Stamps** will do **More and Better Work** in a mortar than any other number, as the motion of the stamps causes a discharge at the ends of the mortar, in addition to the front discharge, thereby increasing the stamping capacity, and leaving the pulp of uniform fineness.
Second. They are the cheapest mills to the stamp that were ever offered to miners.
Third. They do not slime the ores or flour the quicksilver, as the lateral motion of the pulp prevents such effect.
Fourth. They crush all kinds of ore, rock, cement or conglomerate perfectly.
Fifth. They are more durable, as the framework is secured to the mortar and thoroughly bolted together.
Sixth. The several parts are interchangeable and can be readily set up or taken down and duplicated.
Seventh. No skilled labor is required to assemble the parts.
Eighth. The discharge is larger in quantity to the stamp, and the number of drops per minute, (110) of the stamp is greater than any other mill.

Weight of Stamps (each).....850 pounds.
Weight of Mill complete.....7500 "
Power required to drive.....5 H. P.

CAPACITY, SIX TO TEN TONS PER DAY.

PRICE, $450.00

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

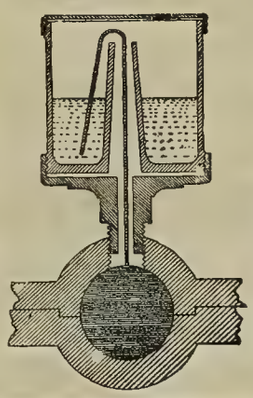
MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Positively Reduces Oil Bills 75 Per Cent.



THE FINCH OIL CUP.

Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.

During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

K. J. McHUGH, 25 New Montgomery St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight. About 5000 Pounds.

It requires no belting, shafting, pulleys or building.
Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.
Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

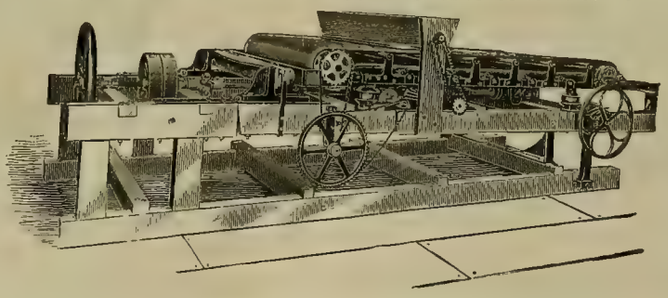
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

THE J. H. MONTGOMERY MACHINERY CO., 1220-22 Curtis Street, Denver, Colo., U. S. A.

Just Listen—Reliable Common Sense Steel Whim, price reduced to $100. Steam Hoisters, $300 and up; hand hoisters $30; steel ore buckets all prices; prospectors' stamp mills $300. A 10-stamp mill, new, 850 lb. stamps, high mortars, latest improved. Only $800.

Ores tested and amalgamation and concentration mills built to fit the ore and guaranteed to save what we say. Coal Mine equipments, Screens, Jigs, Tramways, Arastors, Chilian Mills, Ore Sacks, etc. Cornish Rolls, 12x20, weight 6,000 lbs., price $350; Feeders, Bumping Tables; Blake Crushers, 7x10, weight 8,100 lbs, only $250. Our 100 page illustrated catalogue FREE.

DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Market Reports.

The Markets.

SAN FRANCISCO, July 16, 1896.

The volume of goods going out on orders is large for the season of the year, but the margin of profit is small. The demand is exceptionally large from gold mining districts by reason of a large influx of miners. The call from fruit growing and farming sections in general is about the same as obtains at this season of the year. The prices at which fruits are sold are far from satisfactory. For cereal, dairy product and other farm products the prices average at around last year's figures this month. From the lumbering camps the advices are to the effect that there is a continued fair to good export movement but the home demand is not up to expectation. As a rule manufacturers do not report any particular change in the general situation. Foundrymen and iron workers report a fair degree of activity. Eastern mail advices are to the effect that general business is slow due largely to the presidential election and a growing interest in it combined with the fact that the monetary system of the country seems to be the main issue.

The local money market is essentially unchanged since our last review. Disbursements usual to the month of July are being made. The bulk of these, it is stated, will go into bank for loaning and investment purposes. The statement made that banks and loaners of money are exacting notes payable in gold is, so far as can be learned, wrong, for neither on this coast nor East has there been any departure from the custom heretofore pursued. Eastern money markets are reported fairly easy, with plenty of available funds, but long-time lenders do not wish to extend the time beyond the month of October.

The coinage of silver is to be resumed at the different mints in this country, under instructions from Secretary Carlisle. The outturn is expected to aggregate $3,000,000 a month, and continue the remainder of the calendar year. This action on the part of the Secretary of the Treasury is not due to a change of heart on his part towards the white metal, but to the narrow margin of silver coin available under the Sherman law for the redemption of the so-called Sherman treasury notes, which are retired and canceled when redeemed in silver dollars, and the latter released for general distribution. That silver coin is gaining in favor is witnessed in the amount of these notes that have been redeemed since August, 1893. During the first twelve months ending with August, 1894, the amount that came in for redemption was $4,000,000; the succeeding twelve months they aggregated $8,000,000, and for the ten months ending with June of this year they aggregate $14,000,000. The entire redemption for the two years and ten months since the Sherman law went into effect aggregates $26,000,000, leaving July 1st only $11,217,582 silver coin in the Treasury for redemption purposes. That Secretary Carlisle's decision to have $3,000,000 in silver coined each month to the end of the year does not come any too soon is recognized in the official statement that on January 2nd, 1896, there was held by the Treasury $13,769,608 in silver coin, while on July 1st, 1896, the amount had been reduced to $11,217,582, notwithstanding $7,500,000 had been coined during that period of time. It is doubtful, even with the increased coinage ordered, if the Treasury will be able to add to its reserve silver coin, for it is a well-established fact that the redemption of the Sherman notes is the heaviest during the summer and autumn months. This increase is occasioned by the demand for crop-moving purposes in the Southern and Central Western States, but more particularly in the former, where cotton is the leading production, due, it is said, to the fact that the field hands prefer silver to paper currency.

The Superintendent of Mint's latest estimate regarding the gold output of the world is $220,000,000 with a strong probability that it may go several millions more. The world's production was in 1890, $118,848,700; 1891, $130,650,000; 1892, $146,815,100; 1893, $157,287,600; 1894, $180,626,100; 1895, $203,000,000. The production for the current year, therefore, will aggregate nearly double what it was five years ago. The production of the United States is placed at $54,000,000 for this year which will continue us in the lead as the largest producer of gold. In 1894 Australia was the largest.

New York Silver Prices.

NEW YORK, July 16.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	31½	68⅝
Saturday	31½	68¾
Monday	31 7-16	68⅝
Tuesday	31⅜	68½
Wednesday	31⅜	68⅝
Thursday	31 7-16	68¾

	Copper.	Lead.	Iron.	Tin.
Friday	11 37½	2 97½	11 00@12 50	13 50
Saturday	11 25	2 95	11 00@12 50	13 50
Monday	11 37½	2 90	11 00@12 50	13 50
Tuesday	11 25	2 90	11 00@12 50	13 45
Wednesday	11 25	2 90	11 00@12 50	13 45

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	7½
New York Telegraphic Transfer	.10
London Bankers' 60 days	$4.88
London Merchants	$4.86¼
London Sight Bankers	$4.89½
Refined Silver, peroz., 1000 fine	68¾
Mexican Dollars	54@55c

SILVER.—The market has been quiet, with a downward tendency to Wednesday, when there was a slight advance, with a strong closing reported from New York. Export buyers are said to be more or less indifferent and only enter the market to fill orders. The same condition obtains at New York. The conviction is steadily growing that if the silver convention, to be held at St. Louis next week, endorses either the Democratic nominee or the Populist nominee for President, there will be a strong silver campaign and the market value of the metal be advanced. This view is not only taken by those on this coast who ought to know what is going on in the market, but by those at the East. Whether it can or will be done remains to be seen. The last steamer for China took out $52,500. The aggregate shipments in June foot up $612,885.

MEXICAN DOLLARS.—The market is quiet but steady. The last steamer for China took out 17,813 dollars. The shipments last month aggregate 486,169 dollars.

COPPER.—The market here is fairly steady. At the East the market is slower, with an easier tone, but this usually obtains at this season of the year. It is expected that when the summer and autumn demand sets in prices will be advanced higher than at any time this year. It is stated that the consumptive demand in this country will show a large increase, while abroad the large demand will continue.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The last steamer for Mexican ports took out 101 flasks. For the six months ending with July, 1896, the receipts at this port aggregated 16,089 flasks, and in 1895, 14,181. The exports by sea during that time were, in 1895, 6347 flasks, and 1896, 8547.

The market is quoted as follows:

Home trade, per flask	37 00
Distant points up north	36 25@37 00
West coast of Mexico, for export	34 50

ANTIMONY.—The demand is slow, with the market easy at 7½@8½c in a jobbing way. New York mail advices quote 7⅜@7½c for Cookson's, 6⅝c for Hallett's and 6½c for Japanese, from store.

LEAD.—There is nothing new to report. The market is easy both here and at the East.

Pig, per lb	3 75	@	4 00
Bar	—	@	4 15
Sheet	—	@	5 50
Pipe	—	@	4 75

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The demand is slow, but the market holds steady.

The market is quoted as follows:

Pig, per lb	14½c
Plate, I C coke, heavy, per box	$4 25
" " " light, "	4 10

BORAX.—The market is quoted as follows

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	6⅛
Concentrated, "	5⅝

POWDER.—There is a continued good demand for mining purposes.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

COAL.—Five steamers are to arrive with coal from Japan. A large-sized barkentine, the Theobald, is about due with a cargo of coal from the North Pacific Mining & Transportation Company's mine in Alaska. This company expects to add to its coal fleet in the near future. The market is practically unchanged. The Australian strike is over.

SPOT FROM YARD—PER TON.

Wellington	$7 50@		8 00

LUMBER.—There is a fair home and export demand.

The market is quoted in this city from dock or yards as follows:

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—Jobbers report a fair demand at quotations.

The market is quoted as follows:

Wire, carloads, basis per keg	$3	22½	
" jobbing, " "	3	35	
Cut, carloads, " "	2	97½	
" jobbing, " "	3	10	

Mining Share Market.

SAN FRANCISCO, July 16, 1896.

The market the past week was only moderately active with fair fluctuations under the lead of Chollar. Hale & Norcross has showed more life, owing to active operations having been commenced on the 300-foot Brunswick lode and also an improvement on the 900-foot level Comstock lode. Notwithstanding the market sold down from last Saturday's highest prices, there is a strong conviction with usually well-informed operators that much better prices will be seen within the next 30 or 60 days. While believing this, they say that at any time there is apt to be a slump in prices, which would uncover the weaker margin accounts. While the center of attraction is confined to the work on the Brunswick lode, fluctuations in shares are to be expected, which call for safe-trading and taking of turns so as not to be swamped. That the Brunswick lode has proven richer than the most sanguine had reason to expect before starting active work, yet it is reasonable to assert that it does not warrant high prices, or even as high as are now current, except on a gamble. If mining men's expectations are realized, then much better figures ought to rule. While attention is given to the work on the Brunswick lode, that on the Comstock lode should not be overlooked, for at several points it is of an interesting and important character. Still, traders do not take so lively an interest in the latter lode as in the former, owing to one having been worked over for years while the other is new and therefore an unsolved problem. Shares of the mines in the Bodie district have shown more strength under light trading. This is due largely to the leading mines being under one management, better and more concise weekly reports and also more active work.

The news from the Comstock mines is to the effect that more exploiting is being done by several, while in some of the others dead work is nearing completion. So far as official letters go, there has not been an increase the past week in the working forces of the men employed, but additions are expected to be made by several of the companies within the next two or three weeks. In Alta they are still prospecting on the 725-foot and 825-foot levels, with, as yet, nothing new to report. In the Gold Hill mines they are raising a few tons of ore in Overman while prosecuting work heretofore reported by us. Seg. Belcher and Belcher have resumed extracting ore. The former raised the past week about 27 tons, assaying over $29 to the ton, while Belcher raised 80 tons, assaying about $26 a ton. This is an increase in the number of tons extracted and raised, and also in its assay value. In Crown Point active work is under way on several levels. So far as the information given in the superintendent's letter goes there is nothing encouraging to dealers looking for immediate good results. The work points to more time, yet no one can tell what a day is liable to bring forth. No report of work comes to hand from Kentuck or Yellow Jacket. It is expected that after the current week there will be a change for the better in the latter mine—more men put to work, which, if done, will call for an assessment. They are still raising in Confidence for air connection. Work is continued in the long west cross drift run jointly by Challenge, Confidence and Con. Imperial. It was driven 14 feet the past week. In Alpha they are still driving ahead the southwest cross drift on the 500-foot level. In Bullion there is nothing new to report. Best & Belcher and Gould & Curry report repairing the Bonner shaft. In Con. Virginia they are pushing work on the 1000-foot, 1650-foot and 1750-foot levels. Only 75 tons of ore were raised the past week. The car samples assayed over $54 a ton. At last advices they were still engaged in putting out the fire and purifying the air in the old Bonanza workings. This part of the mine will soon be as safe as any other portion. Work is continued on the Central Tunnel level, and also 1000-foot level of Ophir. This work is being closely watched, as is that in Mexican on the 1000-foot level. In Union they are working on the 900-foot level of the Sierra Nevada and Union shaft. In the Sierra Nevada they are still at work on the Layton tunnel level. In Utah and Andes the work is on the same levels heretofore reported by us.

Our advices from the Brunswick lode are of the most encouraging character. In Occidental there has been an improvement on the 650-foot level. Active exploiting work is continued on the 550 foot and 750-foot levels. In Chollar, on the 300-foot level, work was suspended from Saturday to Wednesday so as to make some needed repairs. It is expected that within a few days they will strike the downward continuation of the ore found on the 200-foot level. In Hale & Norcross active work has been resumed. Considerable confidence is expressed in the outcome. The work under way in Gould & Curry is being closely watched, as is that in Savage, but from the former the best result is confidently looked for by mining men. The shaft in the Best & Belcher is being steadily sunk. From all that can be learned, it looks as if more active times are near at hand.

From the Bodie district our advices are to the effect that in the Standard mine they are working on several levels, but the ore veins are narrow and the assays around $12. In Bodie they are sinking a winze on the Fortuna vein below the 550-foot level. They were at last accounts in a four-inch vein of high-grade gold ore. In Bulwer active work is continued on several levels. A few tons of fair-grade ore are raised each week. In Mono the work is essentially unchanged.

The following illustrates the changes of the week:

Mines.	July 9.	July 16.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem so favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City.

FOR SALE!

A Large and Well-Equipped Gravel Mine.

This is a regular producer, netting from $1500 to $3000 per month. Reasons for selling will be explained to a bona-fide purchaser. Address, GOLD MINE, P. O. Box 66, Placerville.

Encinal Engineering and Machinery Co.,

309 Folsom St., San Francisco, Cal.

Plans, Specifications and Estimates of Machinery furnished and Construction and Erection Supervised. Mines experted and negotiated.

We have a Good Line of Secondhand Engines, Boilers and Mining Machinery.

See our new Stamp Mill and Rock Breaker. Call or write for estimates. Parties having machinery to sell should communicate with us.

Horse Power Mine Hoist.

Horse Powers!

Triple-Acting Pumps, Deep Well Pumps, Cornish and Jack Head Pumps for Deep Mining, Horse Power Mining Hoists, Water Gate Valves up to 40 inches diameter, and Link Chain Elevators, Pipe and Pipe Fittings at lowest prices. Hydraulic Presses. We also manufacture Cyanide Tanks and Centrifugal Sand Pumps for filling and discharging them. These Pumps work the tailings to perfection and are made to handle small or large quantities.

Office and Works: 51 BEALE STREET and 9 to 17 STEVENSON STREET, SAN FRANCISCO, CAL.

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE

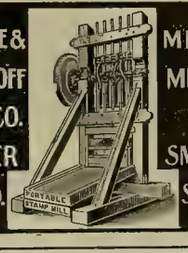
FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared or coating all sizes of Pipes with Asphaltum.

HENDRIE & BOLTHOFF MFG. CO. DENVER COLO.



MINING, MILLING & SMELTING SUPPLIES

M. H. WALSH, Secretary and Manager. C. G. BACON, President.

Sonora Land and Mining Abstract Bureau.

Sonora, Tuolumne Co., Cal.

Abstract of Titles to all lands in Tuolumne County made under the Durfee Self-Correcting and Adjusting System.

Mining properties for sale or bonded on desirable terms. Correspondence invited from principals desiring investments in quartz mining properties or in the development of promising claims. Reliable information given on all matters.

QUICKSILVER!

—FOR SALE BY—

The Eureka Company,

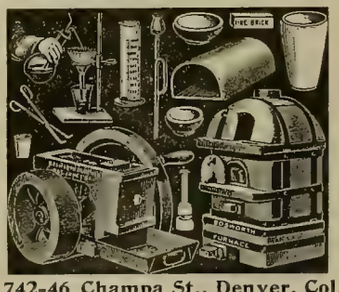
OF SAN FRANCISCO.

ROOM 1, - 426 CALIFORNIA STREET, SAN FRANCISCO.

The Denver Fire Clay Co.

Manufacturers of Assayers' and Chemists' Supplies.

Fire Brick and Tile for Metallurgical Purposes. Importers and Dealers in Chemicals and Apparatus. Sole Agents for the Ainsworth Balances.



1742-46 Champa St., Denver, Col.

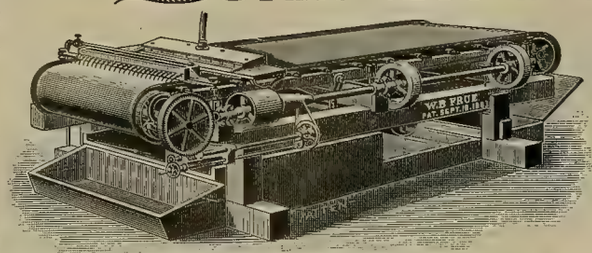
FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.

A Hydraulic Grapple.

Some attention having been directed to a contrivance now in successful use in hydraulic mining in southern Oregon, a photograph of the machine in action was recently secured, from which the accompanying illustration was engraved. The cut represents the grapple swinging a load of small boulders out from the bank.

The grapple, as constructed by Wm. Knox, Jacksonville, Oregon, consists of a cast-iron water cylinder, on which are fastened, by bolts, five T iron straps, with sockets on their lower ends, supporting a wrought-iron ring, which forms the fulcrum or pivotal point of the ten T iron claws that grapple and sustain the load. Within the cylinder is a piston with rod attached, on the lower end of which are fastened ten links, which connect the claws with the piston, so that, by the downward movement of the piston, the claws are made to open and the upward movement causes them to close. The machine is suspended on the boom of a crane or derrick. The power operating the machine, in this case, is taken from the water pipe operating the derrick, and conveyed in 1½-inch pipe to the base of the derrick mast, where a short line of rubber hose is used to admit of the swing or turn of the derrick. The water then passes through a double system of pipe and hose line, fastened on the boom, with suitable valves for controlling its inward and outward flow to the grapple, held in suspension, so that by passing the water under pressure, through the one pipe on to the piston within the cylinder, the claws are made to open; and by reversing the lever, it is made to enter the other side of the chamber and the claws are made to close, the outlet discharging at the base of the mast in either case through the same pipe in which it enters the chamber. The double outlet pipes are drawn together, forming but one outlet, on which is placed a stop cock, which is used to stop the discharge at any time, enabling the operator to open the grapple to any desired size. It is under the control of the engineer at the base of the derrick mast, sixty feet from the machine. With the levers he can pick up any boulder, stump or object within the radius of the boom's length and deposit and stack it, if necessary, 20 feet high upon the bedrock.

This machine is of value to the hydraulic miner, making it possible to work at a profit ground where it is necessary to handle large boulders, heavy tailings, stumps, etc. It is in present operation at the Squaw Lakes mines, Jackson Co., Oregon, handling boulders from one to six feet in diameter and removing large tree stumps, roots and logs, without the use of powder or extra labor. It can be operated with either water or air under pressure or by steam.

HYDRAULIC GRAPPLE, SQUAW LAKE, JACKSON CO., OR., SWINGING FROM BANK WITH LOAD OF SMALL BOULDERS.

Timbering in Drift Mines.

The system of timbering in use depends very largely on the conditions under which the pay gravel is removed. As a rule, a less amount of timbering is employed than formerly. The timber employed, where it can be had, consists preferably of second growth spruce, or more properly red fir, from 10 to 16 inches in diameter. Where this is not available, the second growth yellow pine is frequently used. The logs are stripped of bark and brought to the timber yard of the mine, there being cut into such lengths as are needed from time to time. Where second growth trees cannot be had the large spruce trees are sawed into logs the usual length of timber required, barked and split into two or more sticks roughly squaring from 8 to 16 inches as the requirement of the mine may call for. Lagging are split out of spruce logs six feet long in rough slabs 2 by 6 inches. Wedges are made out of the same material, usually the timber waste in the mine timber yard. Timbers bought by contract are ordinarily paid for by the running foot; lagging and wedges by the one thousand.

In the large mines, where the roof of the breasts is so little cemented and coherent that caves are liable to occur, the timbering is kept close up to the working face. Formerly it was the almost invariable rule to have the caps run from post to post and lag overhead closely. Now the ordinary custom is to set a cap over a post in "T" shape, wedging it tightly to the roof. Not as many posts or caps are required and the use of lagging is materially cut down. The aim of the miner now is merely to keep the roof up at the working face while working at it. The mined-out ground is allowed, and it might be said encouraged, to cave down on the waste boulders that are piled back among the timbers. It has been practically found that the danger of caving is in many mines due to the air slaking of the roof, and that this requires time, enough to admit of the face being advanced the distance apart of the timber sets without supporting the roof. The main tunnel and gangways through this class of ground, however, have to be timbered carefully with a view to comparative permanence and ample pillar protection is left.

In mines where the roof is cemented gravel or lava, posts alone or posts and caps as above are employed, the distribution being controlled by the judgment of the foreman, the idea being to hold the ground only while working in it, and that when it does cave, the timbering shall be sufficient to keep the cave from extending to the breast or working openings. No close regularity of distance apart is observed as in soft ground where timbers are placed at uniform distances. Main tunnels and gangways in this hard cemented roof ground are timbered with a view to permanence, and more care than in the breasts is observed in piling the waste rock. The leaving of pillar protection is rarely necessary.

The cost of timbering by the changes of practice is much reduced. Conditions vary between such extremes that averages are misleading. The maximum cost rarely reaches over four or five cents to the ton carload.

A DECISION of importance in its bearing on the status of the water rights of the power companies that are utilizing mountain streams by electric transmission plants has been rendered by Judge Van Dyke of Los Angeles, in the case Mayberry vs. Alhambra Addition Water Co. The essence of the decision in this respect is in the declaration that the developers of water increasing the flow of the streams are entitled to that increased flow even after it has apparently passed from their control—that is, beyond the point of their primary use. The court recognizes the right of unobstructed recovery of this water by the developers unless voluntarily abandoned. While the decision comes from litigation growing out of the practice in southern California of developing the subterranean flow of the streams with porous beds by building dams from the impervious strata beneath, thus raising the flow to the surface, it logically is applicable to reservoir waters that are used in power development or any other primary purpose and then turned into natural stream channels. By this flow in natural channels developed waters do not become subject to riparian control.

California Mines and Miners, 69. The Dodge Improved Mill; Rock Drilling Contests at the State Fair in September, 71. Coast Industrial Notes: Personal; Recently Declared Mining Dividends; Commercial Paragraphs; Recent California Mining Incorporations, 76. Notices of Recent Patents, 83.

What is "Rock in Place"?

A recent decision by Chief Justice Davie of the Supreme Court of British Columbia has occasioned considerable discussion among mining men and experts and is being quite generally criticized by them. Without quoting the full text of the decision, the essence of it is in the declaration that "rock in place" is "mineral in place"—to which there is no dissent, since the term, though not literally accurate to the language employed, has grown into use from a colloquism—and that "mineral in place" is not mineral in country rock, but "mineral between definable rock walls." This last being indifferently, in colloquial speech and even English as she is written, ledge, lode or vein, the Chief Justice holds that "rock in place" is practically synonymous with "vein" or "lode" and that "rock in place" means a "substance defined between some definite walls or boundaries."

The question of the exact technical meaning of these several terms is not a new one. It has been on the surface of the terminology of the technical expression of the mining industry ever since the discoverers of mineral, where it ought not to be according to Van Cotta and his followers, have been building up new theories to fit the entire range of observed facts, not the portion of them first known. The terminology we use for definition is simply a survival maintained by the conservatism which would make new facts fit old theories regardless, instead of making new theories to fit the new facts.

Rock in place did mean a quarter of a century ago substantially what the chief justice decides it does now, but mineralized country rock was not known then. Its discovery and the knowledge we have of its formation justify the abandonment of the old definitions as not fitting the conditions. In some knowable cases they will fail. They should be cheerfully abandoned with the abandonment of the erroneous interpretation of nature that they defined. In place of the old definitions make new ones. R. L. Dunn, in a paper entitled "The Genesis of Placer Gold," published in this paper in October, 1894, made this distinction between lode deposits and placers—a lode [rock in place], he says, "is a mineral bearing deposit in which the presence of the mineral is due to the operation of chemical forces alone, and is the place of primary deposit; and a placer is a mineral-bearing deposit in which the presence of the mineral is due to the operation of the mechanical forces of nature acting on the lode deposits defined above, and in reference to them secondary." This definition has the essential merit of a simplicity that makes the argument of any supposable case impossible. The evidences of origin in a very few known cases are so obscure as to cause differences of opinion even between mining experts. Its use would tend to clarify mining law and its interpretation. The latter at present seems to be guided by the opinions of witnesses, who, no matter how expert in mining, are, as a rule, the reverse in knowledge of the meaning of words.

Chief Justice Davie based his decision on the opinion of one of the witnesses, testifying as to what he thought was the meaning of the term "rock in place." Accepting the definition suggested, the witness would only have had to testify in answer to the question: "Was the presence of the mineral due to chemical forces alone, or had natural mechanical forces removed it from its original place of deposit?"

Of Present Local Interest.

Some suggestions of advisable action to be taken by the owners of mining claims on the odd sections of the railroad grants, to protect their claims against being patented to the railroad, pending the possible action of Congress this coming winter, appeared in the last number of the MINING AND SCIENTIFIC PRESS. In continuance of these suggestions, mine claimants taking the suggested action would likely find an unavoidable delay in the first step—the approval of the survey by the Surveyor-General, in consequence of the accumulation of the surveys in his office awaiting action. The work of examination cannot be hurried. This delay being inevitable, to provide against its effect, on the survey being completed by the Deputy, a certified copy of his plat and official report, a certified copy of his order of survey, and an affidavit of claimant reciting the facts—that is, the application of the railroad to patent the land, the unavoidable delay which might deprive claimant of his rights if he awaited the regular order of action through the Surveyor-General's office, the facts of his occupancy of the claimed mining ground—should be made the basis of an application to the Land Office for the issuance of the citation for the railroad to appear and show cause why the railroad filing should not be cancelled. The Land Department will certainly respect the sworn reports of its own officers—the Deputy Mineral Surveyors—rendered in the performance of their official duties. If for any reason it does not, the foundation is laid for an appeal to the courts for summary relief, which will delay the issuance of the railroad patent, if nothing more, to the extent that time may be gained giving Congress opportunity to act.

Beyond the protection of the actually vested rights of individuals, the inspiration of the preceding, there are the areas of mineral land unclaimed at present, but which undoubtedly contain gold, undiscovered, but nevertheless existent. It is these lands that the Mineral Land Committee of the State Miners' Association should be fighting for. The opportunities for this are not nearly as absent as has been asserted in the daily press. In fact, the way is cleared for protests that will have to be considered on their merits. The rulings made by the Land Department on protests that have been refused, say as well what the form and matter of a protest should be to receive favorable consideration. The blanket protest has been dismissed on logical grounds; the requirement has been insisted on that the protest must be specific. The Mineral Land Committee should then see to it that specific protests are made. The examination of all of the lands by forty-acre tracts for this form of protest would undoubtedly be beyond its resources, though no such enormous sum as has been claimed. But there is no necessity of examining all the forty-acre tracts. An examination of the lists by the resident surveyors and miners would eliminate safely half, possibly two-thirds, of the listed area as being fairly non-mineral—that is, having on it no mining claims, and its geology such that the absence of mineral deposits could be safely inferred. As to the remainder of the land, the geological character and locus of which is such that the existence of mineral can be reasonably inferred, even if undiscovered, these same resident surveyors and mining engineers could protest on all or part, as far as each one's personal knowledge extends, from their personal knowledge without making examination of the ground specially for the purpose. These protests, costing but a nominal amount, could be made meeting the requirements of the Department, and would certainly be effective in delaying the patenting to the point that Congress might have time to act.

The railroad should have the non-mineral lands, independent of their being of agricultural value or not; but the mineral lands once in their possession, and the extension of the only free industry, gold mining would be restricted for years to come. The railroad, all through their contest for these lands, has insisted that "mineral land" meant "mines," and mines in a most restricted sense, meaning mines that not only produced gold, but produced it at a profit. They have seemingly impressed this construction on the Land Department despite Supreme Court decisions that make a clear distinction. There is a point in this that should not be overlooked in the preparation of protests. Mineral land is not necessarily mines; it has a wider significance. It is land in which the prospects are such that a working miner would be willing to spend his time and money on it looking for mines. Would it not be well for the Mineral Land Committee to consider these suggestions as to economical protests to gain time, if nothing more substantial directly?

A Mining Exhibit at the Mechanics' Fair.

The managers of the Mechanics' Fair in San Francisco this fall are making a creditable innovation in limiting exhibits to Pacific coast products and manufactures. There has been as yet no move to make a mining exhibit on the part of California mining men, nor is there any prestige to be given the industry by an exhibit on the customary lines, exhibits of mining appliances and machinery of course excepted. These latter are instructive and appreciated, and the business interests of inventors and manufacturers can be depended on to make this class of exhibit a prominent feature of the Fair.

Something is needed, however, to take the place of the exhibits of selected specimen ores and rocks which, to the average man not a miner, are meaningless. True they contain gold, silver, copper or whatever it may be; but aside from that fact, which must be and is only accepted on hearsay by our average man, he learns nothing. What is needed is something more comprehensive and concrete, that can instruct directly through the eye of the observer. To accomplish this, we suggest that a reproduction of the mother lode in its extent through the several counties be made in glass, showing the topography of the surface, the towns, the mother lode system of veins and the mines and mills. The Mining Bureau has two views in glass of single mines that illustrate what would be required. Of necessity, minor details of the mines could not be reproduced and a certain amount of distortion would be essential. Nevertheless, a far more comprehensive idea could be had of the mother lode and of the gold quartz mining industry from this reproduction than could be gained in any other way. Particularly striking, too, will be the relation between the developed portion of the lode and the undeveloped portion. Indeed, in this last particular it will be educational to experts even.

The same reproduction of a placer lead would be equally instructive. For this purpose a reproduction of a portion of the Forest Hill Divide is suggested—either that district around Forest Hill that includes the Mayflower and Paragon mines or the district taking in the Hidden Treasure, Red Point and Eureka Consolidated. The latter could include the Pioneer and Herman quartz mines as well. Either of these districts—and they are suggested for that reason—are accurately surveyed and mapped and the reproduction can show bedrock, rims, lava capping and the complex buried channel systems with fidelity to actual ground.

Following close on the educational value of the suggested form of exhibit would come the utilitarian value. Capital which has congested other industries in this State would be induced to flow freely and confidently into the chief profit-earning industry of them all—gold mining.

Concentrates.

SILVER buys as much of anything except gold as it did twenty years ago.

SUPT. HOGG, of the Princess mine, Butte Co., Cal., says he is taking out 150 ounces gold per month.

THE Noble Five Company at Nelson, B. C., will build a tramway and concentrator this summer.

THE Cripple Creek, Colorado, miners decline to strike in sympathy with the striking miners of Leadville.

IT is claimed that 45,000 tons of ore are treated monthly in the United States by the cyanide process, recovering $500,000.

THE Southern Pacific Co. has filed patents in the recorder's office at Bakersfield for 75,409.42 acres of land in the Visalia land district.

THE App and Rawhide mines, Tuolumne Co., are figuring on electro-plating works to do the silver plating required in their respective mills.

AT the State Fair at Sacramento next month there will be two rock drilling contests for miners. The directors have appropriated $400 for prizes in each contest.

L. E. WALKER, S. Wormser, F. Youngren, J. E. Shepard and C. Bonner have incorporated the Stockton and San Joaquin Electric Power Company, to operate at Fresno.

THE Luther Gold Mining Company yesterday incorporated in this city. Directors—E. R. Burke, E. B. Cushman, R. A. Harris, B. G. Smith, F. H. Rice. Capital, $100,000; all subscribed.

AT the Golden Scepter mine, Quigley, Montana, daily wages are: Superintendent, $10; mine foreman, $7; miners, $3.50; millwright, foreman, $6; millwright's, $4 to $4.50; laborers, $3.

AT Austin, Nev., the Austin Mining Co.'s tunnel is now 5000 feet in. There are 1000 feet more to be pierced; 100 men are at work, and it is expected the tunnel will be completed Jan. 1st, '97.

THE ordinary rule is reversed at the Benton mine, Bingham, Utah, where, as the work goes deeper, the ore changes from sulphurets to oxides. Utah is a land of marvels, furnishing silver in sand and gold in coal.

IN a recent drilling match at Wallace, Idaho, between miners from Canyon Creek and a team from Murray, the latter won the purse of $100, drilling 34⅛ inches in the regulation 15 minutes. The Canyon Creek team made 33 inches.

THE Shasta Dredging Company has incorporated to operate dredgers on mining properties. The capital stock consists of 50,000 shares at a par value of $1 each. The directors are P. and A. Becker, J. A. Chesmit, J. G. Barker and L. A. Gibbons.

THE Miners' Mutual Mining and Improvement Co. is a new Montana incorporation with a capital stock of $1,000,000 in $5 shares. Its plan is co-operative and applies some of the features of building and loan associations to mining investment and operation.

A CONTRACT to erect hoisting works at the Allison Ranch mine, near Grass Valley, has been let to W. C. D. Body. Horan Bros. and J. McLachlan have the contract to put in the pipe line. Machinery for electric, steam and water power will be put in.

THE Yuba County Supervisors have employed Dr. P. Durst of Wheatland at a salary of $300 a month to watch the hydraulic miners in the interest of Yuba alone. They at the same time withdraw their financial support from the Anti-Debris Association.

THE suit over the Apple and Brown Maria mines near Needles has been compromised, A. S. Barney, the holder of the contract to purchase the mines, agreeing to pay the owners $22,000 within twenty days, in default of which the title to the mine reverts to the owners.

THE mining districts of northeastern Washington, northern Idaho and the Rossland district of British Columbia are being swept by forest fires, destroying property and forcing a temporary suspension of work at many of the mines. The destruction of timber will be very large.

THE Chinese are not neglecting placer mining though they keep fairly clear of quartz mines. The Quong Foo Co. have bought the Lambing derrick at the Lambing mine in Amador Co. and are shipping it to Mills City, Nevada, where they will use it on a gravel claim they own there.

THE mining of beach sands for gold is reported as being carried on at Lompoc, Santa Barbara county, with, it would seem in the absence of details, fair returns. The statement is made that platinum is also recovered from the sands, which is questionable, certainly as to quantity claimed.

THE Nelson, B. C., smelter is to have additions to it, increasing its capacity at once. A water-jacket furnace of 250 tons capacity, roasters and a reverberatory furnace for the treatment of matte are to be built. An electric plant for the transmission of power and economizing of fuel are under consideration.

THE fall in the price of iron ore has forced the closing down of several of the large mines in Michigan. One company, ordinarily producing 1,000,000 tons a year, alone throws nearly 2000 men out of employment. The business condition is such that operators are unable to hold out any hope of reopening to the miners.

THE exceptionally hot weather is causing much suffering among miners and prospectors in the Mohave and Colorado districts. The temperatures are ranging from 124° to 128°, and many of the springs, few in number and scanty in supply at the best, have dried up, increasing the danger to life incident to travel.

IN consequence of the lateness of the season and depth of snow, the Gold Commissioners of British Columbia have been authorized to extend the time for completing assessment work 60 days from July 17th, where they have good cause to believe the claims inaccessible at the present time by reason of the snow covering them.

THE attorney for the Chinamen cited for contempt for hydraulic mining at Moore's Flat, Nevada county, after being enjoined, has proposed that the injunction be made perpetual, the extreme penalty of the law to be imposed if they work the mine again, and that any further proceedings in the contempt matter be temporarily suspended.

THE Alaska Treadwell Gold Mining Company reports its cleanup for June as follows: Period 31 days; bullion shipment, $68,913; ore milled, 21,451 tons; sulphurets treated, 405 tons; of bullion there came from sulphurets, $20,827. The working expenses for the month amounted to $28,087. The average yield was $3.21 per ton of ore milled.

EL DORADO COUNTY mines are receiving a share of the attention of the foreign capital appreciative of the gold mines of California. Col. W. J. Sutherland is reported to have secured for English capital several properties in El Dorado county, on which development has been done during the past year and will equip them with a milling plant immediately.

THE State Mining Bureau has in press, to be issued shortly, a paper on mining pumps and their installation by H. F. Behr, mechanical engineer. The high professional reputation of the writer, and the practical character his suggestions get by reason of their inspiration from California conditions and experience, will make the book a valuable addition to the library of the working miner.

NOW THAT President Neff, of the California Miner's Association is home he will, doubtless, immediately call a meeting of the executive committee to receive the report of its representative, Hon. Tirey L. Ford, which is awaited by many with considerable interest. It is understood that Mr. Ford's report is exhaustive, giving in detail the progress and present status of the whole matter.

LOUISVILLE, Ky., men who are credited with having sunk $300,000 in trying under mismanagement to make the Idaho mill and mine at Murray, Idaho, pay, have sold the property to Spokane and Coeur d'Alene men comprising the Katie Burnet and Josie Consolidated Mining Co. They will not build a mill on the Katie Burnet, as originally intended, but will operate the 20-stamp mill at the Idaho.

A LARGE electric transmission power plant is to be put up at the Calumet mine at Old Diggings, Shasta county, by Dr. Wm. Gardick, the owner of the mine, to supply the mines and mills at Old Diggings with power. The Hart mine is said to have contracted for 100 H. P. and other mines for lesser amounts. The water of Spring creek will be used and 300 H. P. developed. It is announced that A. B. Paul is to manage the enterprise.

READING of the stagnation in agricultural regions of the Mississippi valley and the East, the lack of market or price for the product of the surface soil, one is inclined to congratulate the farmers and fruit growers of California, resident adjacent to the mines, who are assured of a ready market and good prices from the miners, who have the money to pay for what they want, and who are thus the present mainstay of their agricultural brethren.

AT the monthly meeting of the Executive Committee of the Anti-Debris Association at Sacramento this week C. Mulkey of El Dorado county appeared and stated that he would keep his hydraulic mine closed down until he satisfied the Association that no more injury would result from its operation. W. T. Phipps reported on the condition of the mines watched by the Association, and R. T. Devlin reported on the cases against miners being conducted by him in the courts.

BUTTE COUNTY is the latest to the fore with the story of a ledge tramped over and discarded, principally, it appears, because it was big and white, for thirty or more years, which a little honest prospecting is demonstrating to be a gold mine. The ledge in question is on the Oroville and Quincy road, first used by the immigrants who entered California by the Beckworth Pass route. The discovery of gold value in the ledge is credited to a stranger from the outside—a tenderfoot.

RETURNING miners from Cook's Inlet, Alaska, say the country at the Inlet is barren of gold. They say the miners worked hard and prospected for 200 or 300 miles around the Inlet without finding a single claim that paid anything. Thousands of holes were sunk to bedrock, some of them having to be thawed out by fires before they could be dug. There was no work to be had and from 500 to 700 men are said to be stranded there without the means to leave the country.

SIMULTANEOUS with reports of a "1500-pound gold nugget" in the DeLamar, Nevada, mine, comes an apparently authentic statement that the proposed sale on a $3,000,000 basis of the mine to English capitalists is off, and that the transfer will not be made. There was a difference of about one million dollars between the present and would-be owners that blocked final settlement of the negotiations of purchase. Apart from the extravagant stories told concerning its richness, the mine is an unusually valuable property.

THE Gold and Silver Extraction Co., the owners of the MacArthur-Forrest cyanide process in America, are about to commence a suit to annul their contract with the local company who have the right to use the process in the four counties including the Black Hills district in South Dakota. They claim the local company has not complied with the terms of the contract, their plant being much too small for the amount of ore offering for treatment. The local company will not increase their plant nor permit the parent company to enter the field.

ALL the minor coins, cents and nickels, are made at the Philadelphia mint, and nearly 100,000,000 cents are coined every year. This large number is caused by the large annual loss in circulation. The profit of the Government on their manufacture is large. The blanks are made for $1 a thousand by contract. Blanks for nickels cost a cent and a half apiece. Austria has for some years been experimenting with nearly pure nickel for its minor subsidiary coins. A little cobalt is used to harden it. It is claimed to be satisfactorily tested by use.

THE owner of a mining claim, giving a working bond on it, can protect himself and his mine from liability for the cost of material furnished or labor done on the claim under the bond, by posting conspicuously a notice before work is commenced that the work is done under a bond or lease to such parties, stating their names, and that the owner disclaims for himself and the mine all liability for the cost of such work. The bond should have a condition in it that the party taking the bond will pay for all the work he does under the bond, and the bond should be recorded.

RANDSBURG, in the desert, fifty miles northeast of Mohave, has grown from nothing to a population of 1000 in less than four months, despite the limited facilities for mining. The water supply is still short, though the eastern part of the district has developed well supplies sufficient for its present needs. A pipe line, estimated to cost $40,000 to $50,000, on which the preliminary work is being done, will bring in sufficient water to admit of running large mills. An incident of the development of Randsburg is the revival of interest in the old Panamint mining district in the mountains west of Death Valley in Inyo county. Several sales of mines in this district to Colorado and Utah capital are reported.

AT Monday's meeting of the Debris Commissioners, permits were granted to reopen and hydraulic the Try Again mine near Placerville, and the Raffeto mine, both El Dorado properties. The latter is interesting as the permit was granted so that a rancher could get the tailings to give a top dressing to his land. The Spring Valley hydraulic mine at Cherokee, Butte Co., was granted a permit to work some bedrock cemented gravel, but not the main bank. A permit was refused the Buckeye mine near Volcanoville, El Dorado Co., because the debris could not be successfully impounded. The matter of a permit for the Omega mine in Nevada county will be considered at the next meeting of the commissioners.

ON the Comstock the Savage reports on the 850 level the upraise from the stopes in east crosscut No. 8 has been carried up to the 11th floor. The north prospecting drift from the 5th floor advanced 24 feet; face in porphyry and quartz. The south prospecting drift from the 5th floor of the north upraise advanced 20 feet; face in porphyry and quartz. Main south drift advanced 57 feet. This drift passed through a small streak of ore assaying $37 per ton; face in quartz. Usual work being done on the 750 and 900-foot levels. During the past week 90 tons of ore were milled at the Nevada mill; battery samples averaged per ton: gold $6.15 and silver 10 7-10 ounces; bullion on hand and at the mill of the assay value of $2515.88. No ore was hoisted during the week.

THE opportunities for power development from the waters of the Sierra streams, and the chances for commercial successes thereby, seem to be attracting attention and comment even if practical realization is slow in most of the propositions. The Stanislaus river, between Calaveras and Tuolumne counties, in the heart of the existing great development of the mother lode mines in both counties, is naturally the subject of much consideration as a source of transmittable power. Numerous surveys and examinations have been made and as many installations projected. The latest is to locate a head dam somewhere above Murphys, and by a ditch fourteen miles long to get 1280 feet of utilizable head for 5800 inches of water, all the low water flow of the river, and thus develop 17,000 electric H. P. for transmission.

IN Colorado, particularly, and to a lesser extent in other of the mining States, the practice of leasing blocks of mining ground on tribute to working miners whose capital is in their skill and strength provides opportunities for miners who would otherwise be unemployed. From the extent to which this is done the inference is fair that such arrangements make satisfactory returns to both mine owners and the men. While California mines present conditions that are not identical with Colorado mines, it would appear as if the practice of tribute leasing might be extended to the mutual profit of mine owners and men. There are undoubtedly properties which owners feel they must shut down that miners would be glad to lease in on terms that, by dividing the risks of loss, would justify operations being continued.

A SEQUENCE of the installation of the San Joaquin Electric Company's power house on the San Joaquin river has been the discovery that some of the near-by high bars of that river are desirable placer ground. The electric company, accidentally discovering this, located 320 acres and are preparing to ground sluice with the surplus water. The location of their canal is such that several other bars on both sides of the river can be worked and a pipe line is being put in for that purpose. The discovery, or rather development, for the existence of the gold in the bars was known, would indicate that the early-day miners did not work the more southern placer deposits of the Sierras as closely as they did the northern. There may be opportunities in shallow placers in this section for the working miner which he can work without waiting for the aid of capital.

THE State of Utah proposes to test its right to make selections of mineral lands under the grants made by the General Government, none of which it is claimed make an expressed reservation of mineral lands. The State Board of Land Commissioners have decided to select and enter a section of known mineral land, free from any adverse claimants, for patent to it under one of its grants, the board deciding that the State has as much a right to select mineral lands as any other kind in the absence of a reservation being made. Colorado owns and leases some mineral land, but that occurs through the discovery of mineral on school sections after patent to the State had issued. The selection of known mineral land under a State grant of school lands has been decided adversely to the State in California and the patents where issued have even been declared void where the land was known to be mineral at the date of selection.

IF a location of a mining claim is made for a stated length and width, and it is found, after the monuments have been fixed on the ground and described in the "Notice of Location," posted and recorded, that a less length or width than claimed has been included within the monuments, the monuments can be changed, or, if stakes, moved out, to get the claimed length and width. Provided the additional ground so included is subject to location—that is, is not claimed by any one else; and also provided that when this extension is made, a new "Notice of Location" describing the monuments as fixed by the change shall be posted and recorded. Such a "Notice of Location" should preferably have in it a clause reading substantially as follows: "This location is a relocation made for the purpose of amending and more exactly defining the boundaries of the ground claimed." A claimant should make all such amendments before an official survey for patent is applied for. The deputy surveyor is required by his instructions to survey the monuments as he finds them on the ground. If he finds more ground within the monuments than the maximum permitted by the United States and district laws (if the latter exist), he must cut the claim down to this maximum, keeping within the monuments. He can cut it down further at the request of claimants. But he can, under no circumstances, include in his survey any ground outside of the monuments as he finds them. There are cases where stakes can be moved out by a claimant to get the full dimensions of his claim without posting a new "Notice of Location," but the safer and better plan, in which there is no element of chance, is to post and record this new "Notice."

The Gold Belt of Gunnison County, Colorado.

Written for the MINING AND SCIENTIFIC PRESS by THOMAS TONGE.

Among the new gold producing districts coming to the front in Colorado is that of Gunnison County. The information here given was obtained personally by the writer in two trips in April and May, occupying altogether over two weeks, and involving 300 miles of wagon riding in order to visit a large number of the mines and more or less developed prospects of this gold belt, which is, roughly, about 65 miles long with an average width of about 15 miles. The writer was accompanied by Arthur Lakes, who has had over 20 years' practical geological experience in Colorado.

The southern end of the belt is easily accessible from the town of Gunnison (on the Denver & Rio Grande Railroad and the Denver, Leadville & Gunnison Railroad), daily stages running between Gunnison and Iris, Chance, Vulcan, Spencer, Dubois, Tolifero, etc.

Commencing with the eastern end of the southern portion of the belt, viz., in the valley of Cochetopa Creek, years ago gold bearing ore was known to exist there, but in such form and of such grade that its remoteness from railroad and treatment then precluded its being profitably mined and treated. The subsequent improvements in mining and ore treatment and the reduced cost thereof have now brought this district within the range of a dividend paying proposition.

The district around Iris and Chance has been fortunate in the fact that it has already attracted practical men with capital, and the result has been the opening up of the Mineral Hill group with most encouraging success. A description of this particular property presents a valuable lesson. In June, 1895, two prospectors found and followed an outcropping, sunk on it, found vein of gold bearing free milling quartz, pushed the work, exhausted their means, were unable to procure the necessary hoisting plant, stamp mill, etc., and became financially embarrassed. The property was submitted to O. P. Posey, one of the owners of the Tomboy mine near Telluride, who, after investigation, acquired it for his copartners in the Tomboy and himself, for nominal cash payment, formed a private company, erected hoisting plant, sunk new shaft 190 feet deep, about 1500 feet of drifts on a vein of gold bearing quartz of an average width of 5 feet, and erected a 20-stamp mill and pumping plant. The total cash invested up to the present date is upwards of $75,000, and the results are 60 men at work and about 70,000 tons of ore in sight, blocked out and ready for stoping, which averages about $13 per ton in free milling gold and can be mined and treated for about $3 per ton. In other words, $700,000 net in sight for an investment of $75,000.

The special importance of this property is that the owners, so far, are the only people with capital who have hitherto gone into that particular section. While their above-mentioned improvements have been in progress, the owners of other claims in the district, encouraged by the confidence displayed by the owners of the Mineral Hill group, did further work on their own claims, and the result is that today, within a radius of a few miles from the Mineral Hill group, there are a number of prospects which have now as good or better showings than the Mineral Hill group had when its present owners took hold of it.

The vicinity of Chance shows veins from 4 to 5 feet thick of white quartz, carrying gold.

At Vulcan, as shown in the Vulcan and Mammoth Chimney mines, there has been geyser action, producing bonanza gold deposits near the surface, running as high as $1600 per ton, and, with depth, gold-bearing pyrites.

Near Spencer is the Iron Cap mine, owned by Iowa men, with a free milling vein from 3½ to 8 feet wide, averaging $36 gold per ton. There is a 5-stamp mill on the property.

Near Spencer, too, is the Old Lot mine, which has been taken hold of by D. Hyman, of Aspen, Col. It is at present the deepest mine in the southern end of the belt, being over 200 feet deep.

At Dubois, Iowa capital is pushing the Dubois tunnel, now in over 300 feet, and expected soon to strike the first of a series of parallel rich veins, which are exposed on the top of the mountain and assay well.

In the Goose Creek district is the Carpenter Hill group of seven claims, in which A. T. Hathaway, of the San Juan district, is interested. There are 500 feet of shafts and levels, exposing free milling veins ranging from 5 to 20 feet wide, averaging from $8 to $20 gold per ton.

In addition to the more developed properties mentioned above, there are throughout the whole district, from Cochetopa creek to Lake Fork, numerous other less developed properties of great merit, some of them being actively pushed, with encouraging results, and others only needing the judicious expenditure of a moderate amount of capital to become ore-shipping, dividend-paying mines, while in the intervals between such properties the entire country is more or less dotted over with promising prospects, as yet in the hands of the original impecunious locators, who are unable, for lack of means, to proceed further than the "windlass stage" with development work. Such men, as a rule, are glad to sell their claims for very moderate sums or to give an equal or even a controlling interest to anyone furnishing capital for further development work.

The northern end of the gold belt, including the Quartz Creek district, Box Canyon district, Tin Cup, Union Park, Cross Mountain and Taylor Park, is most accessible from Pitkin on the Denver, Leadville & Gunnison Railroad.

In the vicinity of Pitkin, in the triangle of country, two sides of which are bounded by Ohio creek and Quartz creek, the only really developed mine is the Sacramento, in which the ore body is continuous and well mineralized, remarkably even in character. The property is developed by some 5000 feet of tunnels and levels, the ore ranging from $20 to $300 gold per ton, the production to date being nearly $300,000. What has been and is being done at the Sacramento can apparently be duplicated at fifty other properties in this triangle, the only question being one of capital.

It is within the mark to say that about a dozen mines within a few miles of Pitkin, with judicious management and a moderate amount of capital, could at once or in a very short time ship gold ore and pay dividends. There are scores of less developed properties which only need capital to put them in the shipping list.

Pitkin was a great silver-producing district prior to 1893, and the Cleopatra and Fairview mines on Fairview mountain, seven miles from Pitkin, compare favorably with the very best mines of Aspen and Leadville, as, owing to the extreme richness of the ore, they have never ceased shipping. When silver is remonetized, Pitkin will enter upon an era of great prosperity. In Chicago Park, near Pitkin, a few years ago, two holes were bored nearly 1000 feet deep, penetrating much the same strata as at Aspen, but revealing three rich silver ore zones instead of one. The fall in silver in 1893 prevented shafts being sunk at the bore holes. Within a short distance is a similar basin where bore holes revealed equally good prospects. Such investigations demonstrated the fact that in the vicinity of Pitkin are two of the largest silver ore basins as yet known in Colorado, both practically virgin ground.

Tin Cup is surrounded not only by silver mines, now closed down owing to the low price of silver, but by rich gold placer ground in Bertha gulch and other gulches, Union Park and Taylor Park. Some of these have been worked for many years, though only by hand—that is, without any appliances on a large scale, involving the investment of capital.

Ten miles north of Tin Cup, in Taylor Park, a company composed of Boston capitalists is developing a most important placer enterprise. The company owns about 3000 acres of ground and is building a ditch from Taylor river 17 miles long, 8 feet wide on the bottom, 10 feet wide on the top, 3 feet deep, with a fall of 15 feet per mile, carrying 2000 miners' inches of water, the total cost of such ditch being estimated at $38,000. The company is also building a second ditch from Texas creek 6½ miles long, 5 feet wide on the bottom, 7 feet wide on the top, 2½ feet deep, with a fall of 20 feet per mile, carrying 1500 miners' inches, the total cost of such ditch being estimated at $12,000. Next spring these two ditches will furnish water for hydraulic placer mining on an extensive scale. The lowest estimate of any of the experts as to the gold in the gravel is 25 cents per cubic yard. One single gulch, representing one-tenth of the company's ground, is expected by the experts to yield $2,000,000 in gold.

There are at least 200 square miles of gold bearing gravel in and around Taylor Park, Union Park and Tin Cup; the Boston capitalists are the first who have approached the matter with capital on a large scale; they have only got a mere fraction of the ground; what they are doing others have every opportunity to do in adjoining places.

At Cross mountain, seven miles from Tin Cup, the Wall group presents a valuable object lesson. J. W. Taylor commenced work August 1, 1895, and found considerable ore that panned and assayed well. He put up a small stamp battery and in fifteen days ran through it 151 tons of ore, the result being very satisfactory. The ore averages $65 or $70 per ton and he saves from 60 to 70 per cent of the assay value on the plates. During the past winter he has continuously employed 18 men and an assayer. With cyanide from 90 to 98 per cent of the assay value of the tailings can be saved. At the time of our visit there were 600 feet of workings all in ore and 1800 tons of ore on the dump. The vein varies from 18 inches to 7 feet in width and there were four different places where a shift of men could be set to work on ore apparently belonging to the same ore body.

M. HENRY has discovered the power of sulphate of zinc to absorb sunlight and give it back in the dark. Poudre de riz made with this mineral gives a soft luminosity to a fair young face. A lady cyclist dusted all over with this powder is in herself a lamp on a pitch dark night. The luminous pigment is not liable to be spoiled by damp, by carbolic acid or by any weak acid. It resists rain if united to some strongly adhesive body. There is a house in Paris where a windowless set of rooms is lighted with it. The lady of the house receives there her friends at "five o'clocks." The apartment seemed bathed in moonlight, the curtains are as if studded with glow-worms, the ceiling scintillates. The furniture looks as if rubbed with phosphorus. The play of this light on colored objects gives one the impression of Aladdin's underground palace. Often they take the rich, glowing tones of the topaz, ruby and emerald. This powder does not lose its brilliancy if used in starch or size. A black dress trimmed with lace made luminous by it is more than bewitching.—Scientific American.

Locating Mining Claims.

TO THE EDITOR:—I have before me your question, "Is it the law that one stake or monument is or may be a sufficient marking of a mining location, under the statute of May 10, 1872 (Sec. 2324 R. S. of U. S.) which says: 'The location must be distinctly marked on the ground so that its boundaries can be readily traced'?"

This question has been so often answered by decisions of the courts, that at this late day there can be but one answer possible, and that is in the negative.

A due regard to the distinction between the "discovery" monument or stake, which is usually erected when a lode is first discovered, and the final marking on the ground, whether by stakes, monuments or otherwise, intended as the "location" of the lode, which is usually made after more or less examination of the ground, will prevent the confusion existing on the subject.

In the case of Doe v. Waterloo Mining Co., 70 Fed. Rep. 455, decided by the U. S. Court of Appeals on Nov. 8, 1895, the law of the matter is fully and clearly stated as follows:

"From the evidence it appears that on the 26th day of March, 1881, one P. H. Newbill made the discovery of a mineral-bearing vein or lode in what was called "Grapevine Mining district," San Bernardino County, Cal. On that day he posted a notice upon said premises known as the "Red Jacket" lode or claim, claiming the right to locate 1500 feet on said lead and 300 feet on each side of the same, and also claiming the right to have 20 days from said date in which to complete his boundary monuments. * * * *

"The notice of Newbill should have no other force than a notice of discovery. As a notice of discovery and intention to claim and locate the ground described therein, it was certainly sufficient. Erhardt v. Boaro, 113 U. S. 527, 5 Sup. Ct. 560; Marchall v. Manufacturing Co. (S. D.) 47 N. W. 293.

There is a considerable space in the brief of appellee devoted to maintaining that the notice and acts of Newbill were a sufficient location of the Red Jacket claim; that the one stake he placed upon the ground, claiming 500 feet one way and 1000 feet in another way on the vein discovered, with 300 feet on each side of the same, was a sufficient marking of the boundaries thereof. In the location of quartz lodes, before the mineral act of 1872, such a mode of location was common. Since that date I know of no instance in which such a location has been sustained. Since that date it has generally been held that, in some way, the location should be made in the form of a parallelogram, and the location so marked that its boundaries can be readily traced. The cases of Golden Fleece, etc., Co. v. Cable Consol., etc., Co., 12 Nev. 312–330; Book v. Mining Co., 58 Fed. 106; Gleeson v. Mining Co., 13 Nev. 442–458; Holland v. Mining Co., 53 Cal. 149; Gelcich v. Moriarty, Id. 217, maintain fully that such a location as is claimed for Newbill is insufficient. It is also claimed that the above-named cases decided by the Supreme Court of California were overruled by the same court in the case of Carter v. Bacigalupi, 83 Cal. 187, 23 Pac. 361. I do not think this should be asserted. The question presented in the last case was the sufficiency of a location notice under the local rules of the district, and not as the marking of the boundaries of a claim. Certainly it does not purport to overrule the former cases. Many cases might be cited from other States and Territories showing that such a location is invalid. Yours very truly,

San Francisco, July 17, '96. JOHN M. WRIGHT.

ALUMINUM bars and rods are now being extensively manufactured by the hydraulic extrusion process. A large quantity of gun-metal tram rails have been made by the same process, and experiments are being made to utilize the process to turn out steel rails.

THE per capita of gold money in the United States is: Gold, $8.78; silver, $8.89; paper, $5.92; total, $23.59. France has, per capita: Gold, $22.19; silver, $12.74; paper, .85; total, $35.78. Germany has: Gold, $12.21; silver, $4.20; paper, $1.18.

WYOMING is to have a new national park. A treaty has been concluded with the Shoshone and Arapahoe tribes for the cession to the Government of a section of land ten miles square in one section of the reservation.

CALIFORNIA MINES AND MINERS.*

Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

Continued from issue of July 11th.

Scientific Progress.

How Electricity Manifests Itself and What it Can Do.

A. E. DOLBEAR.*

(Continued from Last Issue.)

Are there any phenomena which imply that rotation is going on in an electrical conductor? There are. An electric arc, which is a current in the air, and is, therefore, less constrained than it is in a conductor, rotates. Especially marked is this when in front of the pole of a magnet; but the rotation may be noticed in an ordinary arc by looking at it with a stroboscopic disk, rotated so as to make the light to the eye intermittent at the rate of four or five hundred per second. A ray of plane polarized light, parallel with a wire conveying a current, has its plane of vibration twisted to the right or left, as the current goes one way or the other through the wire, and to a degree that depends upon the distance it travels; not only that, but if the ray be sent, by reflection, back through the same field, it is twisted as much more—a phenomenon which convinces one that rotation is going on in the space through which the ray travels. If the ether through which the ray be sent were simply warped or in some static stress, the ray, after reflection, would be brought back to its original plane, which is not the case. This rotation in the ether is produced by what is going on in the wire. The ether waves called light are interpreted to imply that molecules originate them by their vibrations, and that there are as many ether waves per second as of molecular vibrations per second. In like manner, the implication is the same, that if there be rotations in the ether they must be produced by molecular rotation, and there must be as many rotations per second in the ether as there are molecular rotations that produce them. The space about a wire carrying a current is often pictured as filled with whorls indicating this motion, and one must picture to himself, not the wire as a whole rotating, but each individual molecule independently. But one is aware that the molecules of a conductor are practically in contact with each other, and that if one for any reason rotates, the next one to it would, from frictional action, cause the one it touched to rotate in the opposite direction, whereas, the evidence goes to show that all rotation is in the same direction.

How can this be explained mechanically? Recall the kind of action that constitutes heat, that it is not translatory action in any degree, but vibratory, in the sense of a change of form of an elastic body, and this, too, of the atoms that make up the molecules of whatever sort. Each atom is so far independent of every other atom in the molecule that it can vibrate in this way, else it could not be heated. The greater the amplitude of vibration, the more free space to move in, and continuous contact of atoms is incompatible with the mechanics of heat. There must, therefore, be impact and freedom alternating with each other in all degrees in a heated body. If, in any way, the atoms themselves *were* made to rotate, their heat impacts not only would restrain the rotations, but the energy also of the rotation motion would increase the virbrations; that is what happens always when an electric current is in a conductor. It appears that the colder a body is the less electric resistance it has, and the indications are that at absolute zero there is no resistance; that is, impacts do not retard rotation, but it is also apparent that any current sent through a conductor at that temperature would at once heat it. This is the same as saying that an electric current could not be sent through a conductor at absolute zero.

So far, mechanical conceptions are in accordance with electrical phenomena, but there are several others yet to be noted. I have spoken of electrical phenomena as molecular phenomena, and there is one more in that category and suggestive, that I wonder its significance has not been seen by those who have sought to interpret electrical phenomena. I refer to the fact that electricity cannot be transmitted through a vacuum. An electric arc begins to spread out as the density of the air decreases, and presently it is extinguished. An induction spark that will jump 2 or 3 feet in air cannot be made to bridge a perfect non-conductor of electricity. Is there more than one possible interpretation to this, namely, that electricity is fundamentally a molecular and atomic phenomenon, and in the absence of molecules cannot exist? One may say: "Electrical *action* is not hindered by a vacuum," which is true, but has quite another interpretation than the implication that electricity is an ether phenomenon. The heat of the sun in some way gets to the earth, but what takes place in the ether is not heat conduction. There is no heat in space, and no one is at liberty to say, or to think, that there can be heat in the absence of matter.

When heat has been transformed into ether waves it is no longer heat, call it by what name one will. Formerly such waves were called heat waves; no one, properly informed, does that now. In like manner, if electrical motions or conditions in matter be transformed, no matter how, it is no longer proper to speak of such transformed motions or conditions as electricity. Thus, if electrical energy be transformed into heat, no one thinks of speaking of the latter as electrical. If the electrical energy be transformed into mechanical of any sort, no one thinks of calling the latter electrical because of its antecedent. If electrical motions be transformed into ether actions of any kind, why, should we continue to speak of the transformed motions or energy as being electrical? Electricity may be the antecedent, in the same sense as mechanical motion of a bullet may be the antecedent of the heat developed when the latter strikes the target; and if it be granted that a vacuum is a perfect non-conductor of electricity, then it is manifestly improper to speak of any phenomenon in the ether as an electrical phenomenon. It is from the failure to make this distinction that most of the trouble has come in thinking on this subject. Some have given all their attention to what goes on in the matter, and have called that electricity; others have given their attention to what goes on in the ether, and have called that electricity, and some have considered both as being the same thing, and have been confounded.

*Journal Franklin Institute.

PROFESSOR LANGLEY'S remarkable instrument known as the bolometer, occupying the entire building of the astro-physical observatory attached to the Smithsonian Institution, is pronounced by Rene Bache the most delicate mechanical contrivance ever devised, inasmuch as its "senses" are more acute than those of any human being. Outside of the building a huge machine, the inside works of which are a clock-work mechanism, pumps sunshine through a long tube into a dark room, where the bright ray passes through a prism; the latter is not of glass, because glass is opaque to the invisible rays of the solar spectrum, but is of rock salt, carefully cut to a certain angle by the famous optician Brashear, and, though the prism looks almost opaque to the eye, it is as crystal to the invisible rays above the violet and below the red. Thus the operator is able to follow the invisible rays along their dark path, their presence and potency being accurately registered, by an instrument having for its most essential part a balance composed of a thread of spun glass and a tiny mirror, the latter attached to a piece of a dragon fly's wing.

SOME singular amalgams of chromium and mercury have recently been obtained by J. Feree by electrolyzing a solution of crystalized chromium chloride diluted with hydrochloric acid with a current of 22 amperes. In this way in a very short time 1½ kilo. of chromium

amalgam was obtained. The amalgam was washed with water and the mercury removed by squeezing in chamois leather. By distillation in vacuo a novel form of chromium was obtained, which takes fire spontaneously in the air, absorbs oxygen and nitrogen at the same time, disengaging enough heat to raise the whole mass to incandescence. It gives a number of very interesting reactions.

Electrical Progress.

Artificial Sunshine.

At the recent meeting of the American Institute of Electrical Engineers in New York, D. MacF. Moore presented a paper embodying the results of his researches in the direction of producing light with sensible heat. All efforts in the production of cold light have heretofore failed, because of the fact that with the exceedingly high potentials required for the production of the rapidly oscillating currents necessary to cause vacuum tubes to glow, ordinary insulating materials do not insulate properly. The nucleus of Mr. Moore's researches and inventions is that of a disruptive discharge of an induction coil, the break of which is produced in a vaccum. Under these conditions it is found that the phenomena produced by ordinary apparatus for producing glow light in a vacuum tube are wonderfully changed, both in power and quality of the light emitted. At the potentials which are used in this apparatus, ordinary insulating materials are adequate for all insulation of the system. The amount and kind of light emitted depends upon the suddenness of the break in the primary circuit of the induction coil, and this, under ordinary conditions, cannot be done rapidly enough to produce the desired effect, owing to the prolongation of the time of making and breaking the circuit caused by the spark which is produced at the make and break of an inductive circuit. By producing this break in a vacuum the narrowest conceivable complete gap in the metallic circuit results in an almost instantaneous discontinuance of current, insuring the proper conditions for the production of cold light. The apparatus by which these results are accomplished are extremely simple, consisting of an ordinary small electromagnet, a vibrating contact contained in a vacuum tube of any desired dimensions which furnish the light by the glow produced in its interior. The vibrating contact is formed of a steel spring rigidly supported at one end and connected in the circuit so that the attractions and repulsions of the electro-magnet located outside the tube inclosing it intermittently make and break the current in which the glow lamp is placed. This glow lamp consists of a simple glass tube of any desired dimensions, exhausted of air and provided with a tinfoil cap at each extremity. These caps are connected to the electric circuit. When the circuit so formed is supplied with current by a battery of a few primary cells, a beautiful glow resembling sunshine is obtained. The color of this glow when contrasted with the light of an incandescent lamp causes the latter to look reddish and to have a wasteful air, indicating the presence of heat waves, while the light of the former appears by contrast to be pure white. While the system has not yet been developed to a commercial basis, the hall of the institute was beautifully lighted by these tubes during the presentation of the paper. A decided advance has been made upon what was thought impossible even a year ago, and the many advantages possessed by cold light mark it as the light of the future for general illumination purposes.

Electrical Hardening of Steel.

A new invention in electrical metallurgy is a process by which it is reported that the inventor, Mr. Taux, has executed the following experiments before a committee of engineers at Strasburg. A drill hardened by electricity pierced a shell twice as quick as a drill of the best steel hardened in the ordinary way. The drill was closely examined afterwards by means of a strong microscope, and not the least injury could be discovered. An electrically hardened circular saw cut iron bars with surprising ease. With a cold chisel similarly treated a steel bar, ½x1 inch, was cut through and the operation was repeated five times on the same bar. Then a cast steel plate, ¼ inch thick, was cut with the chisel, the edge of which showed neither a fissure nor any other alteration afterwards. An electrically hardened table knife cut iron wire of ⅛ inch diameter just as easy as a cotton string. The process is said to consist in the hardening of the red hot steel objects in a conductive bath traversed by an electric current.

ELECTRICITY is one of several forms under which energy becomes appreciable, and, like heat, light or work or any other form of energy, it is measurable and can be produced by or converted into other forms of energy. Farming is carried on in some portions of the world by electric currents passed beneath the ground. In places where the earth has been electrified, production has been increased and the quality of products made superior. After experiments of this character potatoes have been found to show 11 per cent in weight of yield and wheat from 28 to 56 per cent. Roots and esculent vegetables have been harvested four times superior to such product from ground not electrified. In France they have a system of treating wines, called the De Meriten system, after the discoverer, by which currents of electricity are passed through the wines to mellow and preserve those in a healthy condition and to arrest deterioration in those beginning to give way.

THERE are eight storage battery roads in Europe, four of which were installed during the past year. The largest system of this type comprises three roads in Paris, operating nineteen storage battery cars, some of which have been doing duty since 1892, and the addition of a third road last May seems to indicate that for the conditions there existing the storage battery has proved satisfactory. The other four roads are located—one at Birmingham, England, one at Hague-Scheveningen, Holland, and two in Austria-Hungary.—Electrical Review.

A NEW storage or secondary battery for locomotive purposes has been patented, in which the liquid forming the electrolyte, while having free access to the plates, is contained in a suitable absorbent to prevent the free movement of such electrolyte. This corresponds in secondary batteries to what is known as the day battery in primary cells.

Mechanical Progress.

Changes by Punching.

The changes that take place in a sheet of metal while it is having a round hole punched through it were experimentally investigated recently by M. Fremont, who gives the results of his experiments in a communication to the French Academy of Science. Brass, copper, soft steel and wrought iron, in plates 25 millimeters (1 inch) thick, and steel punches 35 millimeters in diameter were used. The die first used was 36 millimeters in diameter; afterwards one 39 millimeters in diameter was substituted, without altering the size of the punch. The hole made with the 36-millimeter die underneath was cylindrical, but with the 39-millimeter die it was conical. The greatest resistance offered to the pressure was the same in both cases, but the total resistance was much greater with the smaller die. From diagrams of the work done, it is shown that when the punch is one-third through the plate, the piece to be removed has been completely sheared round its edges, and the rest of the stroke is only required to push out the plug. Sections of metal plate, with punchings in various stages of completeness, were made by M. Fremont, a cut through the centers of the line of punch-marks being taken with a shaping machine, so as to expose the exact formation. The plug is at first cylindrical and the action of the punch is a shearing one. Later on the plug takes the form of two truncated cones, with their larger ends at the plate surfaces and their smaller ends together at the middle of the plate. When the die is not sufficiently larger than the punch, the hole made in the plate is ill-formed because of the crowding of the metal on the under side, where it then breaks off instead of flowing out. The diameter of the hole in the die should exceed the diameter of the punch by about one-fifth of the thickness of the metal to be punched.—Iron Industry Gazette.

Steel Shafts.

The fact that steel shafts break from the outside, instead of the inside, goes against the microscopical examination of minute bits of the interior of shafts, says *Engineering Mechanics*. One steamship engineer, who had put in 110 steel shafts in fourteen years, one of which had run 1,000,000 miles and is still good, did not take any interest in the microscope. Some engineers still favor the boring out of shafts in order to take away that part containing defects in casting; but this is not a general rule, because often the best part of the steel is towards the center of the shaft and not on the outside. In cooling off a steel casting the sulphur and carbon collected in the center, because that part remained fluid longest. Forgings need annealing just as castings do, but if a steel casting were put in an annealing furnace it would be ruined. One eminent engineer declares the proper way to make a steel shaft is with the hydraulic press. The custom of one well known maker of shafts is to anneal a straight forging, turn it in the lathe and then anneal it again. They produce the collars at the end by upsetting the metal, so as to get the fibers running round into the flange from the shaft. Just what fatigue of metal means in a chemical or mechanical sense is hard to define, as every worker in metal knows. Still, that is the only word we have to describe a result and condition.

IF shears are used for cutting off iron and steel, they should be very sharp and run close, with no lost motion whatever between the jaws. It is better for all nice work to have the stock cut off either by sawing or milling. An old shaper (a new one is just as good) may be rigged up as a special cutting-off tool. A piece of bar metal can be cut in two very quickly with such a machine. Being kept specially for that purpose, there is no time lost in hunting up cutting-off tools or in setting or adjusting the same. The machine is all ready to receive the bar of metal, and a few turns of the hand wheel cut it off, leaving a clean, square end.—The Tradesman.

ACCORDING to *Nature*, M. Moissan, the French chemist, is reported to have discovered a substance harder than the diamond, in the form of a compound of carbon and boron, produced by heating boracic acid and carbon in an electric furnace at a temperature of 5000 C. This compound is black, and not unlike graphite in appearance, and it is likely to supersede diamonds for boring rocks, cutting glass and other industrial purposes. It will even cut diamonds without difficulty, and can be produced of any required size.

REAMERS and taps can be tempered by heating first to a cherry red, next cooling off entirely in a gallon of water in which are dissolved two pounds of salt and one pound of lime. When perfectly cold polish with a fine emery brush; then heat iron ¾x4 inches to a black heat; at the point the change from black to red is observable. Lay reamer, tap or die on the hot iron, observe its color closely, and when it changes to purple put in water.

Practical Information.

Iron Ore in Mexico.

At the city of Durango, Mexico, is a mountain of solid iron ore. It is one mile long, 388 yards wide, and 640 feet high, and represents 1,246,984,244 cubic feet of ore.

Besides the ore exposed on the surface, there are undoubtedly beds extending for thousands of feet below, so that the supply of iron in this mountain may fairly be said to be inexhaustible.

The ore is in the form of the sesquioxide of iron called martite, a mineral having the form of magnetite, but the composition of hematite. From it may be obtained from 60 to 75 per cent of the pure metal. The mountain is surrounded by beds of jaspar and quartz-bearing rocks not unlike those out of which the Iron mountain of Missouri rises. Whether the mass is eruptive or has been deposited by chalybeate waters is a question which geologists have yet to settle.

The mountain is called Cerro del Mercado, or Hill of Mercado, after the Spaniard who came to it in 1562, led by the report that it was a mountain of silver. Till within a few years the ore has been worked only by local artisans, who sold the metal which they made for 35 cents a pound.

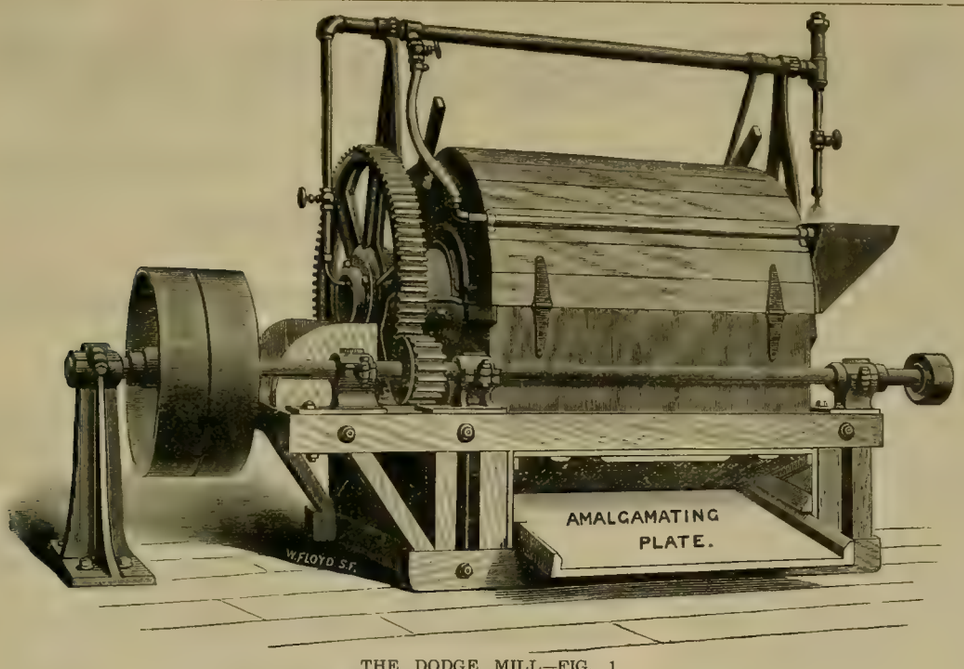
A COMPARISON of the losses of heat by the respiration of an absolutely dry and absolutely saturated air, shows that at 32° we lose 1172 caloric units; and at 86° and dry, we lose 1096 caloric units—a difference of only 76; but at 32° and saturated, we lose 1060 caloric units; and at 86° and saturated, 420 caloric units. The different states of dryness of the air appear thus to be of greater moment than the difference of temperature, and this is why our sensations do not always coincide with the thermometer. The working power of the body depends upon a certain amount of consumption, by which a certain amount of heat is necessarily created, and which has to leave the body in a regular way.

IN casting aluminum bronze care must be taken not to heat the metal too high or the aluminum will oxidize. The alumina thus formed mixes with the metal and makes the casting "dirty." The metal is also liable to be spongy from the presence of occldued gases. If the scum which floats on top of the bronze in a melted crucible goes into the metal trouble arises. This should be prevented by the use of suitable skim gates. The shrinkage of the metal is one of the greatest troubles in making aluminum bronze castings. This is overcome by giving the casting a large sinking head and "risers," but it is often necessary to make the sinking head as large as the casting.

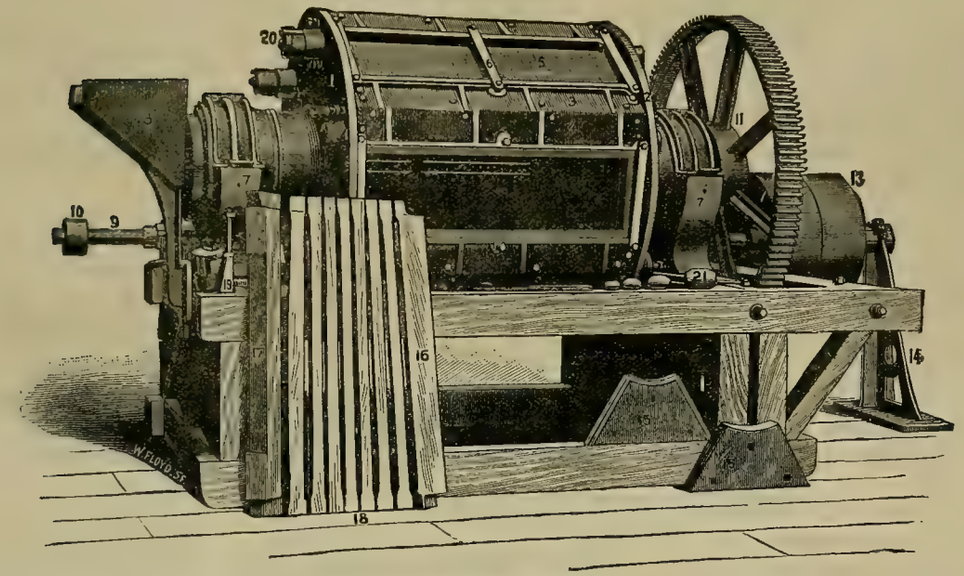
IN the operation of oil wells the flow of petroleum is apt to be retarded by the accumulation of paraffine in the pipes. To obviate the choking of the wells an electric heater has been devised, which consists of a resistance coil of wire to fit easily in the pipes. This is lowered into the well, and when paraffine deposits are encountered they are melted by the heat in the coils, and the clearing of the well is thereby secured.

INSURANCE companies have decided that electric lighting, when the wiring is well done—and they have formulated special rules on the subject—is the safest of all illuminants. Statistics show the following comparative risks: Fires in one year from paraffine and kerosene, 259; from gas, 110; matches used for gas, 35; candles, 88; arc electric lights, 7; and incandescent electric lights, only 1.

How much water shall we drink? Prof. Thos. G. Allen says, from one-third to two-fifths as many ounces as there are pounds in our weight. Thus a person weighing 168 pounds would drink 56 to 84 ounces, or 3½ to 4 pints daily.



THE DODGE MILL—FIG. 1.

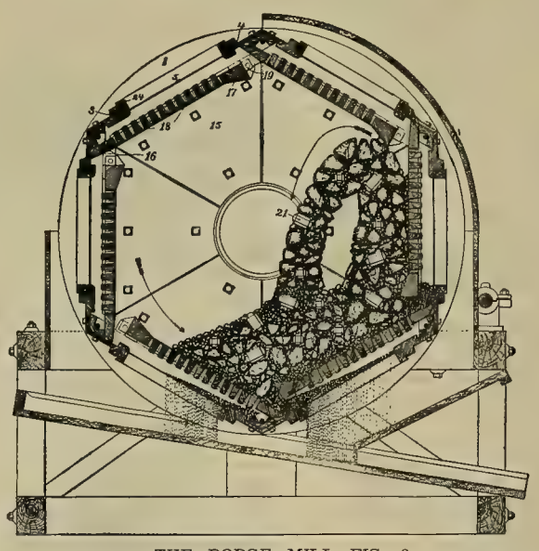


THE DODGE MILL—FIG. 2.

The Dodge Improved Mill.

Herewith is illustrated the Dodge Improved Mill, as manufactured by the Dodge Mining Machinery Co., M. B. Dodge manager, 65 First street, San Francisco, Cal. Fig. 1 shows the mill arranged for wet crushing. Fig. 2, a sectional view, shows that the mill consists of a hexagonal drum or barrel, into which the ore, after passing through a rock breaker, is fed through a hopper. The barrel is lined with steel bars held in place by wedges, and securely fastened. There is a space of ½ inch between each bar, forming a grating through which the ore passes to the screens, which are on each side of the hexagon, affording means of discharge for any ore that is crushed fine enough to pass through them, the coarser particles being returned to the interior of the barrel for further crushing. The ore does not slide in mass, being raised to a certain point and dropped by each side of the hexagon as the mill rotates, thus insuring effective crushing and little wear on the bars. Pieces of hard quartz or ore are used for crushing. Steel grinders, weighing about 15 to 30 pounds each, may be used for this purpose; or, preferably, both steel and quartz are employed. The mill is arranged for either dry or wet crushing, and, the makers say, gives equal satisfaction under either arrangement. When arranged as a dry crushing mill the water pipes and apron shown in the cut are not furnished, and the bottom frame is boarded up, forming a bin into which the crushed ore is discharged, and from which it can be removed by means of an elevator or other device. The jar, caused by the falling of the ore and steel grinders on the bars as the mill rotates, tends to clear the screens and prevents choking, thus adding to its capacity.

Three sizes are made, as follows:



THE DODGE MILL—FIG. 3.

Fig. 3 represents the mill in section. Each set of bars, Nos. 16, 17 and 18, forms a side of the hexagon, each overlapping the preceding side, and leaving a space between for the return of such ore to the machine as may be crushed fine enough to pass between the bars, but not fine enough to go through the screens. Looking at the top of the cut the direction of rotation is to the right, and when ore confined between the bars and screens reaches the highest point and begins to go down on the right hand side, as one looks at the cut, it will fall back into the machine between bar No. 17 and bar No. 16 of the succeeding set. When wet crushing is desired a constant stream of water plays on the outside of the screens, washing the pulp that comes through down to the apron below.

No.	Size.		Capacity.	Horse Power Required.	Tight and Loose Pulleys.		Revolutions Per Min.		Screen Surface.	Weight.	
	Diam.	Length.	Per 24 Hours.		Diam.	Face.	Pulleys.	Mill.		Heaviest Piece.	Total.

Rock Drilling Contests at the State Fair in September.

The Executive Committee of the State Fair have appropriated $800 to provide for two rock drilling contests, with $400 for each contest, to be divided into three moneys, at the State Fair at Sacramento, Cal., next September. A hand rock drilling contest between men is the drilling of a hole in rock with hammers and drills, the same as those ordinarily used in the prosecution of daily labor by miners in a mine, the contest being under certain rules and regulations. Experience in contests of this nature have led to the establishment of certain rules and regulations, the most of which are subject to slight change, but in the main those below given have been generally adopted throughout the world.

There are single hand, double hand and triple hand contests. The most popular of these is the double hand (two men) contest, though the single hand (one man) contest is also in favor.

The rules and regulations here given are with reference to a double hand contest, and need to be but slightly changed for either of the others.

Team—A team in a double hand contest consists of two men.

Steel—The men are to furnish hammers and drills.

Hammers—Hammers must weigh, without handles, not to exceed eight pounds.

Drills—All drills are to be of seven-eighths of an inch steel, and to be seven-eighths of an inch four inches from the bit.

Stroke—One man to strike at a time.

Turn—One man to turn the drill at a time.

Change—Men to change from striking to turning and from turning to striking as often as they desire. Generally changes are made each minute or half-minute.

Time—The time of drilling is 15 minutes at each hole.

Judges—Three judges are to have charge of the contest; they are to be appointed by the association.

Timekeepers—Two timekeepers are to be appointed by the association, whose duty it is to see that each team drills 15 minutes, no more and no less.

The winning team—The winner in a contest is the team drilling the deepest hole in the 15 minutes drilling.

Rock—The rock to be a block of Folsom or Rocklin granite (the harder and more uniform in formation the better) and is to be placed on the ground by the association, one piece to be tipped up so the holes in it will be drilled at an angle of about 45 degrees, one piece to be flat, so the hole can be drilled downward. The surfaces of the rock which are to be drilled must be faced. The judges must mark off the face of the rock in squares of not less than 5 inches each, each square to be marked by number.

Order of drilling and place for each hole—Each team must draw lots for members and drill in 1, 2, 3 order in the squares thus selected by lot.

Duties of the judges—The judges must take entire charge of the contest; see that all rules are properly and promptly obeyed; see that all steel is of proper size; see that all hammers are proper weight, which should not exceed 9¼ pounds, with handles; measure each hole as soon as the team's time is up; keep a record thereof, and, when all teams have finished drilling, announce the result and award the first prize to the team drilling the deepest hole, the second prize to the team drilling the hole next in depth, the third prize to that next in depth, and so on.

Entries—All entries to contests to close a few days before the time set for contests to begin.

Entrance fee—A small entrance fee to be paid by each team to the association as an evidence of good faith.

Professional Cards.

HERBERT LANG,
Mining and Smelting Engineer,
Albany Hotel, Oakland, Cal.

WADE & WADE,
Analytical Chemists and Assayers,
109½ Commercial St., Los Angeles, Cal.

D. B. HUNTLEY,
Mining Engineer and Metallurgist,
TELLURIDE, - COLORADO.

ALMARIN B. PAUL, M. E.,
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

W. J. ADAMS, E. M.
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Eighteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address. 132 Market St., Room 15, San Francisco, Cal.

H. VAN F. FURMAN,
Mining Engineer and Metallurgist.
SPECIALTY:
SILVER, GOLD AND LEAD.
Room No. 118, Boston Building,
DENVER, COLORADO.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

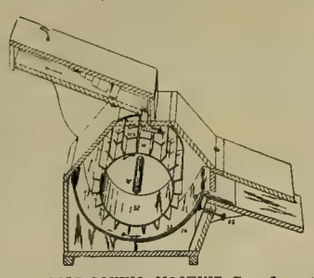
VICTOR AMALGAMATOR

(PATENTED.

FOR MILL OR PLACER USE.



Greatest GOLD-SAVING MACHINE Ever Invented.

It will come nearer saving every color of free gold than any gold-saving device made up to the present time. Whether the gold is fine, flake or flour, its work is perfect. The only machine that works the black sands of the ocean perfectly, saving the fine flake gold contained therein. Our machines are now running on beach sand and on tailings from some of the best mills in California, and they are working successfully. We give guarantee with each machine. In working over old tailings from a stamp mill that contains free gold, amalgam and quicksilver, this machine has no equal. Send for catalogue and particulars. Manufactured only by the VICTOR AMALGAMATOR CO., 703 S. Main St., Los Angeles, Cal.

Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.

No dust. No ashes. Cheap, effective, economical, portable and automatic.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Mining Summary.

CALIFORNIA.

Amador.

Record: At the Kennedy mine there are two triple compartment shafts equipped with every appliance for doing economical and effective work. A 40-stamp mill, with concentrating plant, treats the ore. An average of 125 men are employed in the mine and mill. From the 1200 level, which was reached in 1890, the mine has been a dividend payer. The total bullion output for the last nine years has been $6,000,000. The ore at the present time is taken from the 1700, 1850 and 1950-foot levels. The station is cut and crosscutting just begun at the 2100-foot level. A main east crossdrift is now being run from the 1950 level to penetrate the hanging wall, a conglomerate of slate and greenstone, beyond which an undeveloped ore body is believed to exist.

The shaft at the Oneida is down over 300 feet.

Butte.

(Special Correspondence).—The Golden Feather, Ltd., expect to get into their best ground in the bed of the Feather river early this season. The Banner gold mine, 4½ miles northwest of Oroville, is 3000 feet of quartz lode, bearing NE. and SW. The ore vein is from 8 inches to 2 feet thick; free milling but carrying from 1½ to 2% of sulphurets. The 10-stamp mill, hoist and drills are run by compressed air, the power for which is transmitted by electricity from a water power two miles distant. The mine is worked through a vertical shaft down 1031 feet, the ledge being reached by crosscuts. About 30 tons per day are mined and milled, the ore coming from the development work at present. The crosscut on the 1000-foot level has reached the ledge opening up 400 feet depth of unbroken ground. The property employs seventy men. The Standard Gold and Silver Mining Co., W. S. Williams, Supt., is working several quartz claims at Oregon City, eight miles north of Oroville. Of these, on what is known as the Cambria, a double compartment shaft with steam hoist is down 487 feet on a NE. and SW. contact vein between serpentine and greenstone. The ore chute is 150 feet long and 18 inches wide. Ore is being taken out and milled from the 235 and 400-foot levels. It runs from $12 to $15 a ton. The mine employs eighteen men. The Spring Valley quartz mine, 2¼ miles north of Hengy (formerly called Oregon City), is being developed by a tunnel now in 800 feet, at which point it taps the ore body 200 feet from the surface. They have cross-cut and drifted on the ore body, which is low-grade, running about $6 per ton. The Spring Valley at Cherokee is being worked by a company of fifty Portuguese on shares. They make from $1 to $2.50 per day. The Morris Ravine G. M. Co., Geo. H. Evans, Gen. Manager, have abandoned their mine in Morris ravine, removing their plant to a tract adjoining the Magalia mine on the north and east where they are sinking a shaft to bedrock, prospecting for the Magalia channel. The Princess Gold Mining Co., Geo. E. Hogg, Supt., adjoins the Magalia. It is being developed by a 45° incline shaft now down 320 feet and into pay gravel, on which is a water hoist and steam pumping plant, recently completed at a cost of over $16,000. This company began operations in May, 1895. In running a drift through gravel some 60 feet without breasting out, they took out $5000. The Ram Creek hydraulic mine, W. W. Butterfield Supt., is 26 miles northeast of Oroville, near Brush creek. The mine has a water supply all the year for one giant, and employs four men.

L. P. McC.

Calaveras.

Citizen: Six men are employed on the Holland mine near town, recently bonded by Prince Poniatowski.

A depth of 325 feet has been attained in the Ford shaft with the ledge looking very promising. A station has been put in at 300 feet.

Two forces of men are at work on the Gottschalk mine. In the new shaft a depth of 60 feet has been reached. Sinking has been commenced in the old shaft.

A large water wheel has been placed at the Horswill gravel mine, and the pipe to convey water to the wheel is being laid. As soon as completed, operations on the tunnel will be resumed. It is estimated that 100 feet farther must be run to tap the channel.

The Gwin mine extends about a mile on the mother lode. It is owned by the heirs of the late Senator W. M. Gwin, but has been bonded for $400,000 for a long term to the Gwin Mine Development Company, the principal shareholders in which are D. McClure, Mr. Belshaw, Senator Voorhies of Amador county and F. Thomas the superintendent. The Gwins put down two shafts, one 200 and the other 1400 feet, partly crosscut the vein and did some stoping, taking from the mine $2,000,000. Ten years ago, obstacles were encountered, the mine was shut down, and since then the shafts have become filled up. A little over two years ago the present holders began work and have sunk a shaft farther to the north to a depth of 1300 feet, but starting down from a canyon it is now about 100 feet lower than the level where work was formerly abandoned. At that depth a 16-foot vein of ore running from $9 to $10 has been encountered. Thus far the Gwin Development Company has expented $90,000 in exploration, and has ordered a 45-stamp mill, which will cost $60,000 more. It is to be put at work on the body of ore already struck, but in the meantime the original intention of sinking the new shaft 1500 feet down is to be carried out.

The Butts mine has shut down temporarily. Preparations are being made to sink a new shaft.

At the Peirano mine at Albany Flat a steam plant is being put in.

Osborn and Murray struck a vein on the Field's ranch about a foot in width, which has widened to 14 feet 20 feet down. The ore averages from $5 to $10 per ton.

Del Norte.

Record: Copper-mining interests in Del Norte are beginning to revive, judging from reports. Portland parties who recently bonded several claims at Low Divide, and representatives of New York capital interested in claims in the same vicinity, are expected at the mines shortly. This, with the formation of a local company to develop a copper ledge in the Big Flat mining district, looks promising. The local company will incorporate for $62,000, in shares of $2 each.

El Dorado.

(Special Correspondence).—On the Rosebud, twenty-seven miles east of here, the new tunnel is 88 feet on a 3-foot ledge of very fair ore. This property is owned by Melton & Roberts. It was abandoned years ago, but the present owners are encouraged in prosecuting the work by the discoveries thus far made.

A permit to hydraulic has been granted the Varozza Brothers, three miles east of town.

In the copper mine recently secured by Head, Clark & Bind a shaft was sunk to water depth. A tunnel is now being run on the lode. There are 800 tons of ore on the dump. The ore is composed of malachite, sulphate of copper and oxide of copper, carrying gold and silver.

G. Reiber, twelve miles east, has an aggregate of 330 feet of tunnels and drifts completed. He is opening a large gravel property on an extensive scale.

A contract has been let for a new tunnel on the Blue Gouge, which is already well advanced. If this tunnel discloses an ore body equally as good as the tunnel recently completed higher in the hill, it is a foregone conclusion that extensive milling facilities will soon be started on the Blue Gouge.

It is reliably reported that the Darling mine, ten miles northeast of here, is to be reopened about August 1st. The water will be pumped and the shaft, now 190 feet, continued to greater depth. There is a good hoist and 10-stamp mill on the property. It is owned, I am told, by Mrs. Whitney of Oakland and A. Gallatin of San Francisco.

Kunce & Mills, in the Stale Mountain district, eleven miles northeast of here, have found an 8-foot ledge of ore that will yield $10 in free gold.

The local lumber consumption in this county during the current year for mining purposes, it is carefully estimated, will exceed 5,000,000 feet. It is all home product.

Placerville, Cal., July 20th.

Inyo.

Independent: J. Basto brought into Independence a few days ago 63 ounces of gold, nearly $1200, the result of a cleanup from the crushing of 12 tons of ore from the Uncle Abe mine, in the Alabama Hills, about 12 miles south.

Kern.

Pick and Pan: Frazier and Bunker Hill mining district, over near where Kern and Ventura counties corner is alive with miners and prospectors who are opening up many prospects. The only mine that has been worked to any extent is the Frazier. The Bunker Hill mine is more developed than any of the latter discoveries, and is bonded to New York men, who have a tunnel in 300 feet.

Times-Index: Between 60 and 70 men are working at Goler. There are twelve claims operated, but in each several men are employed at fair wages and the camp is regarded as reasonably prosperous. While there are no big strikes reported as at the opening of the camp, there is an occasional find of a valuable nugget. A few days ago P. Jackson, who purchased the Bald Eagle No. 2, found a nugget valued at $100. There have been several smaller lumps discovered, the largest of which was worth $20.

Mariposa.

(Special Correspondence).—It is reported that a dam is to be put in the Merced river, eight miles above Benton mills, during the next three months, and an electrical power plant at Benton mills. The Horseshoe mine in Hunter's Valley, E. Thom, supt., has been started up and ore estimated to go about $15 per ton is being milled. At Hornitos the old Kellett mine is to be reopened. Two miles from Hornitos C. E. Stuart is working the Dorse mine and taking out heavily-sulphureted quartz. At Haywards the Sellick mine is being prospected. At the Tyro mine, one mile south of Coulterville, the 10-stamp mill is working ore from the 700-foot level.

Coulterville, July 13th.

Gazette: Hutchison and Henderson have uncovered a vein of ore about two feet in thickness and showing free gold. This find is in the neighborhood of the old Mt. Ophir mine that has not been worked for several years.

The Horse Shoe mine in Hunter's valley has fourteen men at work. They are sinking a new shaft and are now down 100 feet. They have some good ore in sight. A piece taken out recently, about eight inches in diameter, was thickly dotted with gold, there being about $75 worth in the rock.

Nevada.

The Metropolitan mine at Moore's Flat has been sold by Geo. Abraham through Geo. F. Davidson to San Francisco men and is being equipped with a new plant throughout. Water for all purposes is supplied from the Eureka Lake & Ditch Company's ditch, with a head of 400 feet to present millsite. It will be worked through a tunnel. Mr. L. Davis, of Moore's Flat, will be superintendent. Late assays from a 2-foot vein average $25.

Transcript: Turner, Morgan, Tilley and others have sold the Texas quartz mine in Willow Valley to an Eastern company. Work will begin there very soon.

Transcript: Twenty-two men are employed at the Mayflower mine on Canada Hill, engaged in development work, no quartz being taken out.

Telegraph: The new concentrators have been put in the Brunswick mill and the additional five stamps will soon be running.

Superintendent Dawson reports the Gold Hill mine nearly ready to start up. The machinery is on the ground and the buildings are about completed. The shaft is now cleaned out and retimbered.

Herald: The Red Hill quartz mine was ground-sluiced and hydraulicked many years ago, but not deep enough to get the richest of the pay, which was in quartz not placer, as the old miners supposed. The property is now owned by the Red Hill Mining Co., Ld., of Glasgow, and Mr. Trevaskis, the late owner, being foreman of the mine. The ledge is about two feet thick where now worked, and courses from northwest to southeast. It is on the slate and granite contact, the hanging wall being of decomposed slate. The ore averages about $10 per ton. Besides the ledge there is a large and scattering formation of very rich pay dirt, red with oxide of iron. While certain spots in the ledge and in small stringers have yielded thousands of dollars in specimens of pure gold, there are other places where, with only a few inches of ledge matter, this red dirt for 10 or 12 feet around has proved to be all "pay." From one hole, about 20 feet square and 12 to 20 feet deep, $5000 was taken out. Most of this sum was in two tons of ore which was pounded up in a mortar. It is common to find spots where from $200 to $300 is washed out of a single pan of this red dirt, while in the mill large nuggets are found when they clean up.

Placer.

Sentinel: Ralston district is being developed by the French company. They have let a contract for 750,000 feet of timber which will be cut near the mine by a new sawmill. Locations recently made have been added to the property, and roads and ditches are being surveyed.

The Truro Placer Mining Co., principally Colfax people, have incorporated to run a bedrock tunnel to tap a gravel channel about three miles from Gold Run on the American river. J. L. Pearson, F. M. Ackerman, S. C. Jordan, H. Disque and G. D. Wyman are the directors.

J. Manson and J. H. Garbe of Towle have built a four-stamp, water-power mill on their quartz ledge in Bear Valley, near Emigrant Gap.

Plumas.

Bulletin: A quartz ledge from 8 to 12 feet in width of milling ore is reported developed in the lower tunnel of the Four Hills mine.

The Jamison Mining Company has ordered 150,000 feet of lumber to be used in the erection of a 10-stamp quartz mill on their mine above Johnsville.

In the Claybank, above La Porte, an upraise to the channel will soon be made. The indications are favorable for finding the channel, which is the same one worked through the Thistle shaft.

Men are now employed at the Gold Bar mine on the Middle Fork of the Feather.

From La Porte recently $60,000 in gold was shipped. It came from drift and hydraulic mines in the vicinity of La Porte, Plumas county, and Gibsonville, Sierra county.

San Bernardino.

The Rose is reported to have been sold for $100,000 to R. L. Grant of Chicago and O. O. Howard Jr., nephew of Gen. O. O. Howard. Mr. Grant is largely interested in Colorado, having recently sold one at Cripple Creek for $300,000. The first shot after the change of ownership opened up a new body of ore that will run from $30 to $40 per ton.

Shasta.

Free Press: There is considerable activity at the smelter yards of the Mountain Mines, Ld., at Keswick. A blower has been put in to increase the supply of air to the present smelter. A force of men are engaged in laying the foundations and building the framework for three large water-jacket smelters, which will be erected immediately. These smelters will be of the same pattern as those in Denver, Colorado, and Butte, Montana.

J. Salee and H. McDonnell are developing the old Copper City property. They have built seven miles of road to the property, following the old tramway. The old tunnel has been cleaned out and they have run a new tunnel 500 feet. This has cut the copper ledge several times. A bunch of pure copper weighing seven pounds has been taken out, and ore developed worth $30 in gold and thirty ounces in silver per ton besides the copper.

Sierra.

The *Herald* says that Supt. Jones has found another gravel channel in the North Fork drift mine at Forest City. The channel was tapped with an upraise, being eleven feet above the main drift. It is blue gravel and pays $2.50 a carload.

Siskiyou.

Journal: Work is being crowded in the American Bar mine, on Klamath river at the mouth of Ash creek. Forty men are employed and considerable gold is realized along the bedrock.

A large body of ore milling $15 per ton free gold has been struck in the Black Bear mine.

The Gold Bar mine at Sawyer's Bar is employing a large force of miners.

The Quartz Hill mine at Scott Bar is being opened up in a quiet way, after being shut down for several years.

Journal: At the Commodore mine, owned by Billups, Humphreys & Quigley, they have just made a cleanup from a six weeks' run, taking out eighty-nine ounces, about $1600, from seventy tons, which averaged $23 a ton. At present they are using arrastras, but propose to erect a 5-stamp mill about next October.

The ditches and creeks in the vicinity of Hawkinsville are all dry and water cannot be had for mining. The numerous small claims in that vicinity, operated by the Portuguese, were quite successfully worked this season up to the time the water gave out. The water held out longer this year than usual.

Tuolumne.

Democrat: At the Chrystalline mine a new air compressor plant capable of supplying four Burleighs has been ordered.

The new 20-stamp mill of the Jumper is running steadily. Since the Jumper acquired the New Era ground, the New Era and Jumper shafts will be connected by a tunnel.

At the Dutch preparations are being made to put in the new hoisting plant. The ore coming from the 400 level is a high-grade.

At the App most of the ore now being crushed is coming from the 200 level. As the water in the mine is being reduced, a better idea of the ore reserves is obtained. They approximate to those of the Utica.

The Vulture mine, on Whiskey Hill, has been sold to B. M. Newcomb for a company he represents for $6000.

Yuba.

Register: At the Daneborg mine during the past three months the company has made a number of improvements, including a 10-stamp steam power mill, three concentrators run by a separate engine, a new hoisting engine of 75 H. P., a new boiler, 54x16, and a large compressor for machine drills. The company have also erected an office building and boarding house.

Democrat: On the Yuba river near Weed's Point, George Weed & Co. are mining the river bed.

Union: The Blue Point drift mine at Smartsville now employs about twenty-five men. The cement is worked in an arrastra.

NEVADA.

ESMERALDA COUNTY.

Bulletin: The Red Light has six feet of ore which will work $40. About 700 feet from the tunnel entrance, porphyry and quartz have been cut. The formation is soft, while the tunnel has been in lime and serpentine.

Barnes & Keyser are still taking out good ore.

OREGON.

BAKER COUNTY.

The last payment of $10,000 for the Union-Companion mines in Cornucopia has been made and the deeds passed and recorded. W. J. Clark, of Montana, and J. E. Searles, of New York, are the new owners.

Democrat: The Basin hydraulic mine, near Sanger, owned by J. Palmer of La Grande, cleaned up $4000 from a twenty-day run. The total output of the Basin mine is now $20,000 and the yield about $400 per day.

DOUGLAS COUNTY.

Plaindealer: The Victory mine on Cow creek, this side of Glendale, sold by Capt. Nash for $100,000, is pronounced one of the best mining properties in the State. A 48-hour run of one giant produced $500. When the steam pump has been repaired the water of Cow creek will keep the giant running continuously. The mine is a bank of red pay dirt, 70 to 80 feet high, whose extent has not yet been determined, but there is sufficient now in sight to continue operations for a lifetime. Preparations are being made to increase the output by increasing the water supply. Fifteen men are employed.

WASHINGTON.

The gold and silver output of the Monte Cristo Company's mines for the last two weeks is the largest made in the Monte Cristo mining district. It consisted of 21 cars of concentrated and 3 cars of unconcentrated ore. The value of the shipment was about $56,000, and the ore was sent to Everett for smelting. The concentrates were from the Mystery mine and the upper workings of the Pride of the Mountains. The unconcentrated ore was from the lower workings of the Pride of the Mountains, in which the strike was made several weeks ago.

Messrs. Lesage, Massi and McDonald, with a crew of men, are doing extensive development work on the Homestake and Wild Cat mines in the Deer Creek district, near Silverton. These are undeveloped copper properties owned by Messrs. Cleveland and Kline, of Monte Cristo.

Index: A strike of free gold has been made in the Little Giant, situated in the Pierre lake camp, in the Reservation country. The gold is in a well-defined vein about two feet in width, which is free milling. This discovery is near the big copper lead.

News: Fifty men will be put to work at Deer creek at once. Horses will be used to pack ore to the railroad for shipment to the smelter. There are 5000 tons on the dump.

Post-Intelligencer: On Money creek, King Co., the largest force of men is probably employed on the Apex, Milwaukee group, distant about 6½ miles from the Great Northern railway. The group was located in 1892 by the present owners and was the first in the district to be opened up and made to pay. The lead is well-defined a distance of 4800 feet, comprising four claims. The vein in the tunnel already driven is from two to five feet in width. The main pay streak, generally on hanging wall, is from two to eighteen inches wide, and composed of solid sulphides of iron, lead, antimony and zinc, carrying from one to three ounces of gold and from five to 126 ounces in silver. An average assay of the ore already taken out this season went over $60 in gold and silver. At present there are eight men working, taking from one to three tons of ore per day out of the face of the tunnel and stope. When sorted and sacked it is packed to the Great Northern railway, thirty pack horses being employed.

It is reported that gold has been discovered in the beach sand, four miles east of Port Angeles. A single pan of the sand is said to have yielded seventy-five colors and that with an ordinary rocker a man can take out $2 a day. Old settlers say that the beach at this same point was mined for gold twenty

years ago, and at that time miners made good wages.

BRITISH COLUMBIA.

Miner: An 8-inch pay streak on the Northern Belle No. 2, Slocan, assays 136 ounces in silver and 30 per cent lead.

The Wonderful is being ground sluiced to find the lead. Float ore is now being shipped. The property was recently stocked in Spokane for $1,000,000, and the shares are now said to be firm at 25 cents.

The Washington has shipped a carload of concentrates. The mill is working the dump, estimated to hold 25,000 tons. It is expected to ship a carload a day.

Tribune: The O K was the second mine in Rossland to make a shipment of ore over the Columbia & Western. The returns have been received from the Trail smelter on a carload of concentrates, and they show $89.70 in gold and $11.50 in silver per ton.

The Le Roi Mining & Smelting Co. is now sinking a shaft from the 450-foot level and will continue it for 100 feet. One hundred tons of ore are being taken out of the mines daily and there are 10,000 tons on the dump.

The Red Mountain tunnel, 40 feet in, has cut a vein of shipping ore. Two shafts are being sunk on the vein, and the property is presenting an appearance equal to any in the camp.

Journal: The Horsefly hydraulic mine, Cariboo, shipped $9300, being only a partial cleanup and making for the season to date between $17,000 and $18,000. A cleanup at the Cariboo mine will soon be made, and the Horsefly will clean up again the last of July.

ALASKA.

News: Arrangements are being made to commence development on the Alaska-Willoughby company's claim at Funter bay. Shafts are to be sunk in several different places to a depth of 200 feet, with levels at 100 feet and at the bottom. The sinking will be done on the ledge, the ore taken being milled. Stoping ground will be opened up and the mines put in shape. As soon as the work is completed the company will, if the development proves satisfactory, add twenty stamps, making a 30-stamp mill The ore of the Shelp claim at Snettisham bay is so rich that the mine has paid its way since it was located. An arrastra is under construction at this mine.

The Sum Dum and Snettisham bay districts are attracting prospectors this season. In the former, new finds are being made of ore similar to that of the Bald Eagle.

The 30-stamp mill of the Juneau Mining Company, in the Basin, is now in operation, running day and night on first-class ore.

News: The Alaska mineral belts formation is of alternate striatas of slate, granite, limestone, porphyry and, in some localities, sandstone. The gold-bearing veins are associated principally with slate and granite, and those of silver with limestone and porphyry, although both metals are found together and more or less in all the formations, except the sandstone. The country rock of the Yukon is principally slate. Nothing but placer mining has been attempted there as yet, although gold leads certainly exist, as much of the placer gold taken out has gold quartz sticking to it. On the Copper river and at Golvin bay the formation is principally limestone, porphyry and slate. Silver and copper ores are known to exist there, and placer gold has been found.

UTAH.

Record: A seam of ore in the Lucky Bill, at Park City, has been struck which averages $45 per ton. The ore makes on the foot wall of a vein fully 4 feet wide and dips from the drift in which it was struck toward the shaft, on which sinking has been started to tap the vein deeper.

The Anchor, at Park City, which has several veins within its lines, has found ore that is rich and has the strike and dip to keep it on the Anchor ground, instead of running into the Daly West ground, as previous strikes have done. Much of the ore recently uncovered is free milling and carries very little lead, while it is thought the entire vein will show an average of about fifty ounces in silver, with a fair percentage of lead.

At the Daly West prospecting and dead work are being done in the mine, but no hoisting, on account of changes and additions to the hoisting plant and buildings now in course of construction.

The Silver King continues to take out ore and pay its regular monthly dividend.

Stringer Bros., who are jigging near the Crescent concentrator, shipped 40,400 pounds of jig ore last week.

The McIntosh sampler shipped 2,170,000 pounds of ore and concentrates from Park City during the week ending July 18th.

Tribune: The Yankee Girl at Silver City has its first carload of ore at the sampler, and another producer is added to Tintic's already long list. The property is located in the town and has been idle for several years till E. E. Jones made further development. But a few shots were fired before the vein was encountered, and since that time it has steadily improved, the ore consisting of a fine galena, running high in silver and lead and in sufficient quantity to enable a steady output to be kept up.

An important strike in the Shoebridge-Bonanza is anticipated from ore being taken out. The ore consists of a galena, resembling very closely that which prevails in the Swansea and others in that locality, some of which has yielded about 100 ounces silver and 25 per cent lead per ton. The property was obtained but a short time ago by the present company, though in early days it was productive, yielding several hundred thousand dollars before it was abandoned. The present company made a thorough test of the old dump, to learn that with jiggers it could be profitably handled. Exploring the property through a new shaft at a depth of about 100 feet they struck an ore body, the extent of which is not yet determined.

MONTANA.

Inter-Mountain: On Wisconsin creek, Madison Co., above the Leiter mine, the Montana Gold Mining and Milling Company is preparing to start the 12-stamp mill, idle for several years past. During the past winter the company has opened up base, silicate and black manganese, ore carrying gold.

Below Leiter's a few miles, a Dillon company is hydraulicking the gravel of Wisconsin creek. The company has expended about $10,000 and is now within 20 feet of bedrock. It is claimed that even at the present depth the ground pays wages to the men.

There is a great deal of activity in placer mining about Alder gulch this season.

At a meeting of the directors of the Iron Mountain Mining Company at Helena it was decided to run a tunnel 5600 feet in length to tap the shaft of the mine at a depth of 1600 feet. It will cost about $70,000 and will take a year to complete. By working through the tunnel the mine can be operated at a saving of at least 25 per cent over present cost. The tunnel will be 8 feet wide, 7 feet high and double tracked. The regular monthly dividend of a cent a share has been declared for July. It amounts to $5000. The company has about $40,000 now in the treasury to begin work on the tunnel. The net output each month runs from $8000 to $15,000.

World: At present there is but little work being done on the porphyry dike, and, with the exception of M. Manual's property, the others are closed down. The question is not "ore in sight," but one of economical milling. The ore is very low grade, averaging from $2.50 to $4. The dike is 600 feet wide and several miles long, and at the bottom of the 100-foot shaft of the Pauper's Dream claim the ore is of the same character and grade as on the surface. The cost of mining and milling was in the neighborhood of $2 per ton.

Returns made to the County Assessor of Silverbow county by fourteen mining and smelting companies aggregate $3,634,606.76 as the net profit of operation for the preceding assessment year.

Miner: The Elmira, a prospect lately discovered at Clancy, on Legal Tender hill, is now in the windlass stage of development. The shaft is down 25 feet and has yielded two and one-half tons of ore that will go 200 ounces. At the bottom of the shaft the streak of shipping ore is from 6 to 14 inches in width. Sinking will continue until a depth of 50 feet has been reached. Should the mine hold out at this point it will be developed more extensively.

Independent: The Eva May is shipping about fourteen tons of concentrates a day. The Eva May has immense ore bodies and employs a large force of men. Capital is becoming interested in the Cataract district, and there is every prospect that several big mines will be opened up there this summer.

The Blaine & Garfield Company is resuming work, stoping out ore and doing development work. The Blaine has been closed for four years, but the road built last fall will enable the mine to work now at a good profit. In 1887 ore was hauled to Wickes at a cost of about $5.50 a ton, but it can now be hauled to Basin and loaded on the cars for $1.50 a ton.

SOUTH DAKOTA.

The first three carloads of ore shipped from Danialson fraction lode on Yellow creek, yielded over $1300 per 20-ton car. The present output is from thirty to forty tons per day.

The Ninth Cavalry M. Co. have contracted sinking their 65-foot shaft 50 feet deeper. The mine is near Rochford, on a large vein of ore.

A discovery of high grade gold ore has been made by G. Coates on his claims near Hill City, adjacent to the Cowboy tin mine.

The first carload of ore from the Anchor and Balmoral property, situated near Ragged Top mountain, has gone to the D. and D. smelter. From assays made, the carload will yield between $2000 and $3000.

Times: The Wasp Mining Company, in the Yellow Creek district, has discovered a fine body of siliceous ore lying below the quartzite. The ore lies flat, similar to the formations above, and is of the same general character as the siliceous, highly oxidized ores of this district. It is of much higher grade than the ore above, running $130 gold per ton, on an average, and there appears to be a large quantity of it. The ore was only recently discovered, and consequently has not been developed yet. It is the intention of the owners to sink through the ore and crosscut the shoot. It has been discovered also that the footwall was solid ore of high grade. The generally accepted theory among mining men has been that the quartzite was the foundation of the siliceous ore formation; that there was no use sinking below the quartzite, as no siliceous ore would be found. This discovery then appears to upset this theory, and has thereby added importance. The *Times* reported, a couple of weeks ago, the discovery of a flat body of siliceous ore on Squaw creek. The report excited interest and many mining men visited the ground and found the vein to exist just as reported. Some mining men have volunteered the opinion that siliceous ore deposits exist below the quartzite, but that they are vertical veins. They believe the siliceous ores were thrown up from the source of precious metal, through seams in the quartzite, and were then flattened and spread out by water. But these two discoveries have contradicted such theories, as the ore deposits are found to be flat and quite similar to regular shoots, now so clearly located and defined.

There certainly has been wonderful advancement in the methods of developing our mines in the past two years, and the results of the deep mining have proven of inestimable value. There is no longer any speculation or doubt about the existence and uniformity of the ore zones, and mining at present is simply a business proposition. However, there is yet much to be learned, even by those who have given the closest application to the industry.

Pioneer: The new camp on Castle creek, Pennington Co., is at the junction of Middle and Main Box Elder creeks. The ore bodies are large and the ore, which is talc and granulated quartz, is the freest milling of any discovered in the Hills. Pan tests of surface and float give $2.50, and at a depth of ten feet it runs as high as $4.

Review: The Overland mine near Clancy, operated by Essler and Stahl, is shipping a carload of ore per day to East Helena, the lowest returns from which have been $800 per car.

A new mining camp called Sylvanite has been opened in the Kalispel country and is very promising. The Goldflint is one of the chief mines of the district.

COLORADO.

At the Sleepy Hollow mine, Gilpin Co., a hoisting plant is being put at the 800 level, and the east and west drifts at this depth have been started. In the shaft they have a vein 4½ feet wide. Twenty-two men are now working in the mine. Daily shipments of from 60 to 70 tons of ore are made to the Eagle mill.

Writing from Colorado Springs, under date of the 17th inst., F. H. Pettengill says: "It would almost seem that the market will never reach bottom—down, down, they all seem to go—and those whom we would naturally expect would brace it look on with apparent indifference, or they industriously take hold and help bear everything, seeming to forget that a lower quotation means a narrower market, absence of confidence and a shrinkage in one's assets. Now there is no use of anyone becoming disheartened; stocks are all right and will recover. The main trouble is Colorado people allow themselves to be influenced by New York's stocks, which at present seem to be slowly going to nothing—election, silver agitation and various other complications. In my opinion, mining stocks are far better securities for a hold than two-thirds of the listed stocks on the New York Stock Exchange; they are subject to fewer manipulations, fewer re-organizations and numerous other diseases all too common to New York stocks.

Republican: For the past four months almost weekly note on the progress of development in the ground of the Arcadia company at Cripple Creek has been reported, and the property is now showing fully as much strength and greatness as did the Independence under the same amount of development. The shaft is down 135 feet; there is one level 70 feet and another 48 feet in length. The ore was entered at 35 feet from the surface and from there there is a continuous and regular body, with all headings still in ore and a decided widening and improvement in the body with every foot advance. From 12 inches the high grade ore has widened to 30. The lowest shipment ever made from the mine ran 2.7 ounces to the ton, and the average is above $100. Last month the property cleared $147.50 a day from development work and the run this month is much higher. Ore carrying as much sylvanite as any from the Independence is now being mined, and an average assay across a 16-inch streak of it gave above $9000 a ton a day or two ago. Twenty feet north of the Arcadia shaft Tutt, Penrose & DeWitt are getting the same ore, and from the dip of the chute the Abe Lincoln shaft of the Marinette company will undoubtedly come into it with depth.

In the Annie C., in Swift Water district, about a foot of fine sulphide ore, which comprised what has always been considered the foot wall, has been found. A wide streak of mill ore and a foot of sulphide ore was being followed upon as being the full extent of the lead. When about 20 feet of work had been finished on this particular lead, it was noticed that what had been looked upon as the foot wall was apparently a blue porphyry formation, and on putting in a couple of shots it was found that about a foot of $100-ore formed a blanket over the true wall, which is now partly uncovered.

Republican: In the Sneffels district a strike has been made by Bridenstein, Hubely and Clark in their Gertie lode. A vein of twenty inches of ruby and brittle silver was developed. Work has not progressed far enough to ascertain the value definitely of the ore yet to be taken out.

Ouray shipments during the month of June amounted to 162 cars, within three of the May shipments, the latter being the largest on record. This number added to the Red Mountain output makes a total of over 400 cars.

The Benedict will ship a car of good ore, and other shipments will soon follow.

The Melvina, Gold Hill mining district, Boulder county, is progressing and will commence shipping ore soon. In the 400 foot level an 18-inch streak of ore has been found that is gradually widening out. In the center of this is a 2-inch streak with sylvanite all through it, while many pieces are mottled all over with free gold. Workings north of the tunnel are also coming into sylvanite. A sample made of third-class ore gave a return of $115.50 to the ton.

NEW MEXICO.

Gazette: The Victor mine, at the head of Colla canyon, Cochiti mining district, in New Mexico, has been bonded to Colorado parties for fifteen months for $50,000. The owners are to receive, in addition, ten per cent of all ore valued at $30 and fifteen per cent of all ore over $500 per ton taken from the property in the fifteen months. This lessee agrees to put in thirty days' work each month for fifteen months.

Enterprise: In the Chance mine, Central district, 150 feet down the vein has increased in size and value, and considerable quantities of ore are being extracted.

The Lost mine ore chute continues to increase in richness as development work progresses.

On the Golden Gate claim, Pinos Altos, the shaft is down 40 feet; the bottom is in ore, copper and iron pyrite which runs about 15 per cent copper and carries about $9 per ton in gold and silver.

On the Mountain Key the old workings on the several levels from the 300-foot down will be drained and reopened. The two upper levels are producing sufficient gold ore to pay all expenses.

The Golden Giant shaft is down 360 feet. Since the mill was started the output has been from 400 to 600 ounces of gold per month, and about 200 ounces more from concentrates shipped to the smelters. The second level has produced nearly twice as much gold as the first level and the third level twice as much as the second from the same extent of ground worked. Forty men are employed at the mine and mill.

Bell & Stephens are sinking the new shaft upon the Mina Grande mine. It is down 120 feet and will be continued to 160 feet, where levels will be run, the south one connecting with the old adit level. Seven men are employed. On the Pacific the same firm has nineteen men employed. Shaft No. 1 is down 400 feet and drifts are being started on the vein. The ore from the two mines is being stored in the mill yard at the mill, waiting for the water supply of the rainy season.

At Bald mountain Crawford and Woodward have five men at work on the Big Casino mine. The principal value of the ore is in gold.

Messrs. Sapp & Hannas have started work upon the Old Man mine at Camp Fleming, employing five men.

ARIZONA.

Herald: A. L. Butler and A. J. Murphy have six men at work on the Jessie R. group, 35 miles east of Prescott in Cherry creek district. The main shaft of the Jessie R. is down 180 feet on an incline vein. At 85 feet a level runs east 24 and west 60 feet. Another shaft near the west end of claim is down 50 feet, with drifts running east and west on course of vein. The mine is paying working expenses. The last shipment of 18¾ tons is said to have yielded 43 ounces in gold.

The Mammoth mine, J. E. Allen owner, is on a quartz ledge 3 to 5 feet wide. The main shaft is down 140 feet on a 45° incline.

The Rocky Pass mine is now under bond and worked by Williams and Adams of Jerome. The vein is not large but in places rich. A tunnel is in 300 feet and from the tunnel a winze is down 60 feet with drift at the bottom on a fine vein of ore.

Orb: The usual amount of copper, amounting to nearly 1000 tons per month, is being shipped from Bisbee by the Old Dominion Co. About 750 men are on the payroll at present.

At Pearce a project is being considered to work the ore at that place instead of shipping. Samples of the ore are now being tried, and if it is found that the ore can be satisfactorily worked, the old Severns mill will be started on it.

Work on the Tomlinson Hill still continues, and considerable free gold is being found. The Golden Bow and other claims belonging to Tomlinson, Garrett and Sydow are showing up in good shape. The shaft at the Little Jessie, sunk on the top of the hill, showed free gold in an iron-stained quartzite from near the surface, there being no defined ledge. The whole hill is of the same formation; and if the same assays are found in the tunnel which is to be started at the bottom of the hill, Cochise county will have a most promising gold claim.

MEXICO.

Oasis: G. Robinson is working the tailings at La Mina Barranca in the Sahuaripa district. There are some 35,000 tons of tailings which assay twelve dollars in silver and two dollars in gold. They are worked by a new leaching process, and at a small cost yield two-thirds of the assay value. Work was commenced in December, and within the past month the plant was put into operation and is now yielding regular returns.

Don Fortunato de la Vega, who owns rich gold properties at the mining camp of Real de Quebrada Honda, Sinalca, is about to put up reduction works.

It is said that the drowned out mines in Pachuca suffer a loss of at least $200,000 a month because of the water. The San Rafael alone has been known to mine $100,000 per month for export.

Times: The San Domingo placer fields in the Alta river bed, Sonora, Mex., have been bonded for $400,000 by an English company, and $250,000 will be expended in machinery, dams and shafts. The concession is eleven miles long and the dirt is said to average $9 a cubic yard.

La Mina Colorada, Ures district, about thirty miles from the City of Ures, has been sold to a Guaymas, Mex., company. The price paid was $30,000 silver. The mine has produced largely in the past, and is expected to renew its productiveness.

The Mexican Ore Company of Hermosillo, Mex., has placed in its works new and costly machinery, which is capable of smelting forty tons a day.

SOUTH AFRICA.

The De Beers Consolidated Company (G. T. Williams, formerly of Oakland, manager,), which has the largest and richest diamond mines in the world at Kimberley, has declared a half-yearly dividend of 18s per share, and an extra dividend of 4s. With the dividend of 18s declared last December, the total distribution during the year ending June 30, 1896, was 40s per share, equal to 40 per cent on the share capital. This is the highest dividend ever declared, and at the same time the reserves of blue ground, in which the rough diamonds are found, are announced to be greater than ever. The quotation of the £5 shares is now £31. The gross profit for the year was £2,248,000, and the net amount available for dividends was £1,900,000.

Journal: The total output for May on the Rand was 195,008 ozs., an increase of 21,000

ozs. over April. The following were the leading producers: Robinson, 17,049 ozs.; Ferreira, 13,115 ozs.; Crown Reef, 10,939 ozs.; Langlaagte estate, 9323 ozs.; New Primrose, 9004 ozs.; Simmer and Jack, 8654 ozs.; City and Suburban, 8350 ozs.; Henry Nourse, 6297 ozs.; New Heriot, 6033 ozs.; Geldenhuis estate, 5897 ozs.

Coast Industrial Notes.

—The Shasta County supervisors have ordered the construction of another bridge across the Sacramento river at the mouth of Cottonwood creek.

—The electric light and power plant of the Tuolumne E. & P. Co., on the Stanislaus river, was seriously injured by a bolt of lightning last week, the dynamos being burnt out and the machinery being otherwise injured.

—In Santa Barbara Co., Cal., the Ojai Valley Railroad construction will begin September 1st. A subsidy of $10,000 has been given by the inhabitants of the valley, and the necessary right-of-way secured. The construction is in charge of Captain Cross.

—A broad gauge lumber railroad seven miles long is being constructed by the Sierra Nevada Wood & Lumber Co. from Truckee to Overton, a new lumber camp. There are seventy men employed grading and clearing, and it is expected to complete the road within the next thirty days.

—John W. Ferris, 320 Sansome street, San Francisco, has had 150 men with a large excavating plant at work for two years removing hills and grading a 45-acre tract in the southwestern part of this city, making 500 building lots, to be ready for street work and construction Jan. 1st, '97.

—The Union Iron Works, at the request of the Japanese Government, has submitted bids for the construction of two high-class cruisers for its navy. At Washington, where the bids were opened by the Japanese minister before being forwarded to Japan, the impression among the naval experts is that the Union Iron Works will secure the contract on one if not on both.

—During June merchandise was shipped East from Sacramento by the S. P. Co. as follows: The figures represent tons: Borax 61, brandy 19, canned goods 50, cattle 3315, dried fruit 14, green fruit 4224, hides 26, hops 13, horses 54, leather 112, lumber 118, miscellaneous 259, ores 1108, potatoes 567, powder 42, rice 32, saddlery and harness 4, canned salmon 18, vegetables 718, wine 567, wool, grease 132, wool, pulled 19, woolen goods 1; total, 11,473.

—During the fiscal year ending June 30, the receipts at the U. S. Custom-house in this city aggregated $5,526,535.34. The exports of merchandise and treasure were as follows: Domestic—Merchandise, $31,127,452; treasure, $7,326,597; total, $38,454,049. Foreign—Merchandise, $465,904; treasure, $6,291,476; total, $6,757,380. The expenses of the collector's office for the year aggregated $358,869.98. There are 256 employes, the annual salary list being $228,629.67.

—The South Yuba Water Co. has commenced the construstion of their storage reservoir dam at Clipper Gap, Placer county. The reservoir will cover 40 acres and hold 21,000,000 cubic feet of water. The dam will be 426 feet long, 150 feet width of base and 42 feet high, the construction being of earth and puddle. A large number of men will be employed. The object of the construction is to protect the development of electrical power for transmission to Sacramento from danger of interruption by breaks in the long lines of mountain ditches above the reservoir.

Personal.

J. B. TREADWELL is at Nevada City.

W. L. AUSTIN is sojourning at Globe, Arizona.

JAS. H. KINKEAD has returned from Needles, Cal.

J. H. TIBBITS has returned from Buluwayo, South Africa.

R. F. HARRISON, manager of the Rose mine at Victor, is in the city.

J. B. FARRISH, M. E., who recently returned from Mexico, has gone to London.

PASCAL GARNIER, a French mining engineer, is in this city en route to Coolgardie, Australia.

BARRY SEARLE goes to South Africa to take charge of the Crown Deeps property, Johannesburg.

GOULD & CHALMERS have been awarded a contract for making a complete plat-book of Mono county.

JULIAN SONNTAG has been elected president of the Manufacturers' Association, Horace Davis resigning.

GENERAL WADE HAMPTON, U. S. Railroad Commissioner, is in San Francisco on his annual inspection of Government aided railroads.

W. HAMMOND HALL is the deserved recipient of the Norman medal for '95, awarded by the American Society of Civil Engineers for his recent paper on the Santa Ana canal.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

Commercial Paragraphs.

THE Pacific Sheet Metal Works, 209 Mission St., now daily make over 400,000 cans for packing salmon, fruit, etc.

THE Risdon Iron Works of this city have the contract for the new electric plant at Ogden, Utah. Five Knight wheels will be used.

THE new smelters for the Mountain Mines Co., building by the Fulton Engineering and Shipbuilding Works, are in process of completion.

THE Bald Eagle Mining Co. of Sum Dum, Alaska, have placed orders for a second shipment of Springer six-foot canvas belt concentrators, and Supt. Trowbridge says they are doing first-class work.

THE John Taylor Co., 63 First St., S. F., are manufacturing a combined crucible and muffle furnace that takes a 12x6x4 or "J" muffle and No. 10 or equivalent size crucible, that admits of using either coke or coal as fuel.

THE B. C. Iron Works Co., Vancouver, B. C., ask for exemption from taxation on extensions, and say that $100,000 will be spent on a marine railway, $125,000 on the extension of the present works for manufacturing machinery and $100,000 addition to working capital. They propose to employ 200 men.

RECENT sales by the Dow Steam Pump Works are an electric driven triplex plunger pump for the Banner mine, Butte Co.; an underwriters' fire pump for the Sierra Lumber Co., Red Bluff; a sinking pump for the S. C. G. M. Co., Placerville, Cal.; a combined air and circulation pump for the steamer Barclay Golden.

THE Pelton Water Wheel Co. have the past week made the following shipments: A 200 H. P. wheel for the Mountain Mines in Shasta county, a 160 H. P. wheel and accessories to the Juneau Electric Light Co. in Alaska, a 250 H. P. wheel for the Garnet mine in Montana, a 150 H. P. wheel for the Heppner Flour Mills in Oregon, a 400 H. P. wheel for the Michoacan Mining Co. in Mexico.

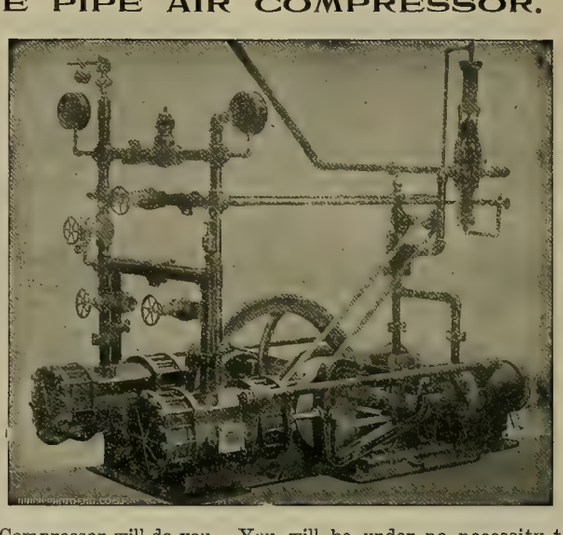
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

(MACARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

The Kendall system is covered by patents which this company will defend.

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

Owners of mines and reduction works can obtain full information on application to

PAYNE'S

PATENTED

GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

1710 Champa Street, DENVER, COLORADO.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

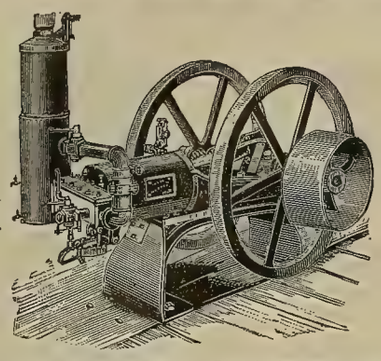
FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY



BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 5¾ gallons @ 14c.	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c.	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c.	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c.	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

Market Reports.

The Markets.

SAN FRANCISCO, July 23, 1896.

Jobbers report a large increase in the volume of goods going out over that at the like-time last year. The different transportation companies corroborate the above but say that the increased movement comes from the mining districts in California and Pacific coast States in general. The strength displayed by wheat so early in the harvest season is having a beneficial effect. It gives encouragement to the belief that many producers will be able to cancel a part if not all their obligations. The prices ruling for fruits admits of a fair profit to the grower. Manufacturers, considering the time of the year, are fairly busy.

The local money market continues easy with gilt edge paper quickly taken by the banks. The latter still discriminate closely, which allows outside lenders to place funds at good rates. Money continues to seek this coast for investment in gold mines but owners of good propositions are slow to let go except at higher prices than was asked a year ago. From the East our advices are to the effect that money is firmer caused by the outflow of gold to Europe, but the action of the banks in coming to the relief of the Government until crops begin to move is having a favorable influence. Business at the East is said to be quiet but not more so than usually obtains at this season of the year. Owing to prominence given to silver by the political parties in this country, and the interest taken in the subject by all classes, the present position of silver, so far as the United States is concerned, is for account of the Government. There is practically no coinage of legal tender silver dollars, except from the bullion securing the Sherman "Treasury notes," and these silver dollars are only coined to redeem these notes, and when so redeemed they are cancelled. Of the total issue of Treasury notes (which reached the maximum of $155,931,002) there has been redeemed to July 1, $26,247,722. Fractional silver coin is of course coined only for the account of the Government according to the needs of circulation. It is legal tender only to the amount of ten dollars. The standard weight and fineness is lower than that of the standard dollar. The weight of the latter is 412½ grains and the fine silver therein is 371¼ grains, while the fractional coin is of a weight equivalent to 385.8 grains to the dollar and the fine silver therein is 347.22 grains. Although silver standard dollars are legal tenders for all purposes to any amount, the "silver certificate" of deposit issued by the Treasury against these dollars is not legal tender except for customs and taxes and all public dues. By tacit consent of the banks, they are not considered clearing house funds. Silver certificates are redeemable by the Treasury only in standard silver dollars.

New York Silver Prices.

NEW YORK, July 23.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	31 7-16	68¾
Saturday	31½	68⅞
Monday	31 7-16	68¾
Tuesday	31½	68⅞
Wednesday	31½	68⅞
Thursday	31½	68⅞

	Copper.	Lead.	Iron.	Tin.
Friday	11 25	2 95	10 75@12 50	13 50
Saturday	11 25	2 90	10 75@12 50	13 50
Monday	11 25	2 90	10 75@12 50	13 50
Tuesday	11 25	2 90	10 75@12 50	13 50
Wednesday	11 25	2 90	10 75@12 50	13 50

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, ¾ per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	5
New York Telegraphic Transfer	7½
London Bankers' 60 days	$4.88
London Merchants	$4.86¼
London Sight Bankers	$4.89¾
Refined Silver, per oz., 1000 fine	68⅞
Mexican Dollars	54@55c

SILVER.—The market on this coast and also at the East is quiet but fairly firm. Shippers only take for pressing wants, claiming that prices in this country are too high for profitable shipment. There is some buying for speculative account by parties having idle money, who believe in better prices later on.

MEXICAN DOLLARS.—There is a fair inquiry but not up to what had been expected would rule in this month for export to the Orient.

COPPER.—The market is quiet. There is strong probability that Japan may have two war vessels built in this city, which will increase the consumption. The East reports quiet but fairly firm markets. In their last circular letter James Lewis & Sons, Liverpool, say: "The firm who have recently bought so largely have quietly continued their purchases whenever they could do so at cheap rates, and must now have control of a quantity approximating 20,000 tons. The total stock of Chili bars, which practically means that of G. M. copper, in England now amounts to only 25,627 tons. Stock taking has somewhat diminished deliveries, the decrease in English and French stocks for the month of July being 1021 tons. From 41,528 tons on the 1st of January the public stocks in England have diminished during the half year to 28,393 tons, or 13,135 tons, while during the past twelve months the diminution amounts to 24,059 tons. There must also have been a considerable reduction in the quantity at the works of smelters and manufacturers. The branches of trade which consumes copper continue very active, shipbuilders, locomotive engineers, dynamo makers, and wire drawers being especially busy."

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is practically unchanged.

The market is quoted as follows:

Home trade, per flask	37 00
Distant points up north	36 25@37 00
West coast of Mexico, for export	34 50

ANTIMONY.—The demand is slow, with the market easy at 7¾@8¼c in a jobbing way. New York mail advices quote 7⅜@7½c for Cookson's, 6½c for Hallett's and 6½c for Japanese, from store.

LEAD.—The market is quiet. The largest consumer in this city has imported quite a quantity. It is said that it will cost more than if domestic had been bought, unless it is worked up into lead in bond for export, then a saving is made.

Pig	3 75	@	4 00
Bar	—	@	4 15
Sheet	—	@	5 50
Pipe	—	@	4 75

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The demand is slow, but the market holds steady.

Pig, per lb	14½c
Plate, I C coke, heavy, per box	$4 25
" " " light, "	4 10

BORAX.—The market is quoted as follows

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	6⅛
Concentrated, "	5⅝

POWDER.—The market is firm at quotations with a continued free consumption.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON.—The market is reported firm with a continued good consumption for the season of the year. At the East the market is said to be easy, with a lessened demand, but this always obtains at this season of the year.

Our market is quoted as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 50
Gartsherrie	21 50	23 50
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c	
Lake Superior Sheathing		20

COAL.—There is absolutely nothing new to report since last week's issue.

SPOT FROM YARD—PER TON.

Wellington	7 50@	8 00	
Greta	6 00@	6 50	
Nanaimo	6 50@	7 00	
Gilman	5 50@	6 00	
Seattle	5 00@	5 50	
Coos Bay	— —@	4 50	
Cannel	— —@	8 50	
Egg, hard	— —@	11 50	
Wallsend	— —@	7 00	
Scotch Splint	— —@	7 50	
Brymbo	— —@	7 50	

TO ARRIVE—CARGO LOTS.

Australian	5 50		
Liverpool Steam	6 25		
Scotch Splint	— —		
Cardiff	6 25		
Lehigh Lump	9 00		
Cumberland	13 00		
Egg, hard	10 00		
West Hartley	6 50		

COKE.—The market is quoted as follows:

Gas Companies'	— —	— —	
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—The home demand is said to be quiet, but there is good shipping movement.

The market is quoted in this city from dock or yards as follows:

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is quiet. Dealers do not anticipate wants, under the belief that the market will go lower.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, July 23, 1896.

The market fluctuated to lower prices the past week. Trading has been only fairly active, and at each decline there was more or less selling by outside holders. The large proportion of those that sold were on a margin and compelled to this course so as to strengthen their account. It is stated that quite a number of holders having cash shares also sold under the belief that they could buy back for less money before another advance sets in. The decline was brought about by those manipulating the market not giving it any support. Notwithstanding this, it is a well-established fact that the shares sold drifted into the hands of those who have taken them out of the market, which has made several quite scarce and exceedingly sensitive to any demand from outside buyers. At yesterday's low prices, when Chollar sold at $1.80, Potosi at 90 cents and Con. Virginia at $1.55, the shares of the north-end and Gold Hill mines were as low as they were when the Chollar deal began, but Gould & Curry, Savage, Chollar and Potosi were higher. The better prices ruling for the latter is due to the work that is being done on the Brunswick lode and favorable chances for finding quite a body of ore in one or more of them. The work under way in the different mines on the Comstock lode does not attract much attention from dealers, but mining men who profess having knowledge of the lode are watching it with considerable interest, although they say it may take several weeks yet before it will be advanced far enough to warrant asserting whether it is a failure or success. While saying this they are quite sanguine that it will be successful. In the Bodie shares trading was quite active at higher prices under the lead of Bodie, which sold up to 66 cents. It is reported that it is the intention of the new management of Bodie, Mono, Bulwer and Standard to consolidate the mines into one so as to reduce expenses and run them on a business basis and not as a speculative proposition.

From the Comstock mines the news, so far as official advices go, is essentially unchanged. In Alta they are saving some ore while prosecuting the work on the levels heretofore published. In Overman they are raising each week a few tons of ore assaying around $30 a ton. No work, so far as we can learn, is being done in Caledonia. In Seg. Belcher and Belcher a lessened number of tons of ore were raised the past week. The car sample assays were also slightly less. In Crown Point active work is going on around the 600-foot, 700-foot and 1100-foot levels. The most interesting work is to the west on the two first-named levels. We are not advised of work having been resumed in Kentuck and also if they are working in Yellow Jacket. In Confidence they are still raising for air connection. No ore has been extracted for several weeks. No work, so far as we are advised, is being done in Challenge. The joint Challenge, Confidence and Con. Imperial west crossdrift is in over 600 feet. In the latter mine another crossdrift is being run on the surface tunnel level. In Alpha they are still running the southwest crossdrift on the 500-foot level. It is in over 135 feet. The long west crossdrift being run by Bullion is in over 3350 feet. Work is continued in Potosi on the 450-foot level, but nothing new is reported. In Chollar they raised the past week over 90 tons of ore, assaying over $25 a ton. In Hale & Norcross, on the 900-foot level, they are pushing for the continuance of the ore found in Savage. A small stringer of ore was cut which gave a high assay. In Savage the work is about the same as reported last week. Some fair-grade ore is being raised and sent to the mill for reduction. Work is continued by Gould & Curry and Best & Belcher in the joint east crossdrift from the Bonner shaft. Con. Virginia extracted and raised over 100 tons of ore last week, which assayed about $60 to the ton. The work that is being done on the 1000-foot level toward Ophir is being closely watched, as is the work on the same level that is being done by Ophir and Mexican. Work is continued on the Central tunnel level by Ophir. There is no change in the work that is being done in Sierra Nevada, Union, Utah or Andes.

The news from the Brunswick lode is of an interesting and important character, which will soon have a strong bearing on the market. Whithin a few days, some say by Sunday, while others say August 1, the south drift on the 300-foot level in Chollar will have been advanced a sufficient distance to admit of three crosscuts being started at on the same day. The superintendent of the mine stakes his reputation as a miner that he will strike the downward continuation of the ore found above. It is the impression that the vein will be wide and the ore probably higher grade. It is quite certain that with the striking of the ore on the 300-foot level there ought to be better prices for the shares. On the 200-foot level they are running two crossdrifts. In Hale & Norcross work is continued on the east and west crossdrifts on the 300-foot level. They are also pushing the north drift towards the Savage line. They have about 150 feet to run yet before reaching it, but when it does the latter company will continue the drift. In Savage the work reported last week has been suspended. In Gould& Curry the work is said to be of an interesting character. It is being closely watched by experienced miners. Work is continued in the shaft in Best & Belcher's ground. In Occidental work is continued on the 550-foot, 650-foot and 750-foot levels. So far as we are advised there has been no change to report.

News from the Bodie district is about the same as given in last week's issue. A proposition is said to be on foot to pump out the Mono and Bodie shafts by electric power, this being considerable cheaper than if done by steam owing to the high price of fuel. If this proposition should be carried into effect it means a revival of mining in that district.

The market opened this morning firm for the Gold Hill shares, steady for the northends and weak for the middle shares. After regular call considerable strength and activity was developed in the Gold Hill shares, under the lead of Challenge. The advance caused the middle and north end shares to firm up in sympathy. What caused the upmove in the Gold Hills no one seems to know, for there is nothing new from the mines, but an assessment is said to be pending on three of them. The Bodies sold lower, but Occidental sold slightly higher. A winze is to be sunk below the 750-foot level in Occidental. The management of this mine seem determined to find out how far down the ore extends. That found on the 750-foot and the other levels justifies the new work.

The following illustrates the changes of the week:

Mines.	July 16.	July 23.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REGULATOR FAUCET FOR LIQUID UNDER PRESSURE.—Samuel C. Freels, Hollister, Cal. No. 563,952. Dated July 14, 1896. The object of this invention is to provide a simple and effective faucet, by means of which the pressure in the vessel from which the liquid is withdrawn is reduced and held in check in such a way as to permit the liquid to flow without undue foaming or the presence of the unrestrained gas. The faucet has a conical valve-plug adapted to engage with a correspondingly conical seat, whereby the liquid is permitted to pass around said valve-plug in a thin sheet or film, and in connection with said plug there is a circumscribing wall over which the liquid overflows from around the plug in a thin sheet on its passage to the discharge.

Books Received.

THE *Engineering Magazine* has issued a volume that engineers and constructors of engineering work will appreciate. It is Volume II, 1892–1895, of "The Engineering Index," and has been prepared by experts selecting from papers read before technical and engineering societies and from current technical periodicals—such matter as is thought to have a permanent value, and adding to the title index notes that give a general idea of the scope of the article indexed. With Volume I it makes a complete classified index to the engineering literature of the past eleven years. The index was started by the Association of Engineering Societies, but is being carried on by the *Engineering Magazine*, which will issue the index annually hereafter. The engineering profession will find these volumes of permanent practical value in their practice. The price of Volume II is $4. For sale by the *Engineering Magazine*.

Assessment Notices.

MARGUERITE GOLD MINING AND MILL CO. Location of principal place of business, San Francisco California. location of works, Auburn Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 18th day of June, 1896, an assessment (No 3) of Ten Cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 257 12th St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of July, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on FRIDAY, the 28th day of August, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office 257 12th St., San Francisco, California. Office hours from 4 to 6 P. M.

BEST AND BELCHER MINING COMPANY.—Location of principal place of business, San Francisco. California. location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of July, 1896, an assessment (No. 60) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 33, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of August, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 27th day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of July, 1896, an assessment (No. 4) of Two cents (2c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of August, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 21st day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, Room 38, Crocker Building, San Francisco, California.

DELINQUENT SALE NOTICE.

NIMSHEW GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Nimshew, Butte County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the Fifth (5th) day of June, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
D. Gutman, Trustee	19	500	15 00
D. Gutman, Trustee	20	500	15 00

And in accordance with law, and an order from the Board of Directors, made on the 5th day of June, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, Mission Street Pier No. 1, San Francisco, California, on MONDAY, the 3rd day of August, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

C. D. COOK, Secretary.

Office, Pier 1, Mission Street, San Francisco, California.

ANNUAL MEETING—The regular Annual Meeting of the stockholders of the North Pacific Mining and Transportation Company will be held at the office of the Company room 5, No. 632 Market St., San Francisco, California, on Monday, the seventeenth (17th) day of August, 1896, at the hour of 1 o'clock p. m., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Wednesday, August 12th, at 3 o'clock p. m.

E. D. FARISH, Secretary.

Office—Room 5, No. 632 Market street, San Francisco, California.

A Large, Valuable Mining Property For Sale CHEAP.

Situated within the Rich Mineral Belt

OF NEVADA COUNTY, CALIFORNIA.

From Emigrant Gap, C. P. R. R., distant in a northerly direction by wagon road eight miles, and consisting of nine full claims of 1500x600 feet each; all heavy veins from 2 to 10 feet wide, one 30 feet. One of which is patented; balance possessory title perfect, with sufficient development done upon six of the unpatented claims to entitle owners to patent. But one of the group has been operated by the present owners; this one (the Last Chance) is now being developed and the ore mills from $2.50 to $102.50 per ton, free gold, and has from the start to present time yielded a net profit of 30 per cent over total running expense. CAUSE FOR SELLING—The company has no capital, therefore the property is too large for us to handle satisfactorily. Would sell a part or all; would prefer to sell an undivided one-half. Price $18,000 cash; or for the whole, price $40,000 cash; or would give a working bond, price $60,000, 30 per cent cash. Also three other distinct groups, all situated within the same belt and county, one of which consists of six full claims 1500 by 600 feet, patent applied for; another of four full claims, one patented, and still another of three claims, unpatented, all large, heavy veins. Included in the last named three groups are four mines that were worked quite extensively 25 to 40 years ago and have an A1 record: one yielded an average of over $40, another over $30, and two more over $20 per ton free gold. Will sell one mine, one group or two groups. Will give purchaser pick and choice. This is an unprecedented opportunity for mining men of capital to secure a valuable property at a reasonably small figure. Come and look at it. No triflers or middlemen without positive backing need apply. For further particulars, please address **S. B. FOWLER, Maybert, Nevada County, California.**

Gentlemen:

We desire to express to you our appreciation of the 12 H. P. Power Gasoline Hoist, purchased by us for our works at Silver City, Utah. The same is working satisfactorily to our Board of Directors. We have never yet used in any one day, five gallons of gasoline [illegible] to do our hoisting, although we are running two shifts of men, one at night and one in the day, using the engine during the day only. We are satisfied that in a dry country, or in one where fuel must be transported any considerable distance, that the gasoline hoist is the proper one to purchase; for that matter, we may say, even where water and fuel is plenty, after a thorough test of the Hercules Gasoline Engine, we would not consent to the erection of any other plant, as it costs less than three-fourths of a cent per ton hoisting one hundred and sixty-five feet high. We therefore take pleasure in recommending the Hercules Gasoline Engine as being the most complete and successful hoisting engine of that kind in the market.

Very respectfully,

For Aces Mining Company,

By Franklin Booth President.

Fac simile of letter to

By J. R. Slater Secretary.

HERCULES GAS ENGINE CO., builders of Gas, Gasoline and Crude Oil Engines, from 1 to 200-horse power. Hoisting, Pumping, Stationary and Marine. Office, 405 and 407 Sansome Street, San Francisco, Cal.

For Sale, Cheap.

SECOND HAND.

One 25 H. P. Ohmn Engine;
One 40 H. P. Tubular Boiler.

Address, CALIFORNIA ELECTRICAL WORKS, 35 Market St., San Francisco, Cal.

FOR SALE!

A Large and Well-Equipped Gravel Mine.

This is a regular producer, netting from $1500 to $3000 per month. Reasons for selling will be explained to a bona-fide purchaser. Address, **GOLD MINE, P. O. Box 66, Placerville.**

PACIFIC COAST AGENTS

THE POOR MAN'S MILL AND ENGINE:

THE ..... DANIEL BEST CRUDE OIL .. ENGINE.....

CAPACITY,
2 to 200
HORSE POWER.

The Cheapest Power Known;

Invaluable Where Fuel is Scarce.

The most economical motive power ever invented, costing but 10 cents per H P. per ten hours; run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

THE KINKEAD QUARTZ MILL.

The Kinkead Quartz Mill will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine, to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

Price of Mill $1,000, f. o. b. San Francisco, including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole Mill. This Mill can be made in 300 lb. sections, if desired, at extra cost. Send for Catalogue.

Interior of Four Kinkead Quartz Mill Plant at Virginia City, Nevada, Equal to Twenty Stamps, Crushing Fifty Tons Quartz Daily Average.

Call and See Our Kinkead Quartz Mill in Operation. * * * 413 & 415 MARKET STREET, San Francisco, Cal.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1882.—VOLUME LXXIII. Number 5. SAN FRANCISCO, SATURDAY, AUGUST 1, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Springer Concentrator.

Herewith is presented a cut of the Springer concentrator. The inventor and manufacturers claim for it: "Perfect distribution of the pulp over the belt by means of a readily controlled hopper and drip pans. An end rocking motion which can be adjusted to the best settling qualities of the pulp and the quantity of water. Adjustment in the grade of the belt while running at full speed. A soft flooding wash of concentrates before entering the receiving tank. A sure and certain cleaning of the belt of concentrates in the receiving tank. A belt to which will adhere all concentrates and slimes. Adjustable eccentrics, so that the shaking stroke can be adjusted, as well as a machine that requires little attention in operation, with small wear." They say this concentrator "embodies all these features to a perfected degree, and requires so little attention that one man can easily attend to a dozen."

The belt is made of No. 3 canvas, woven specially, with solid rubber flanges. There is a steady uphill travel of the belt on the rolls over the head roll or drum and below the surface water of receiving tank. Its weight is 2000 pounds and it occupies a space of 9x12 feet. The canvas belt is a special feature of the Springer concentrator.

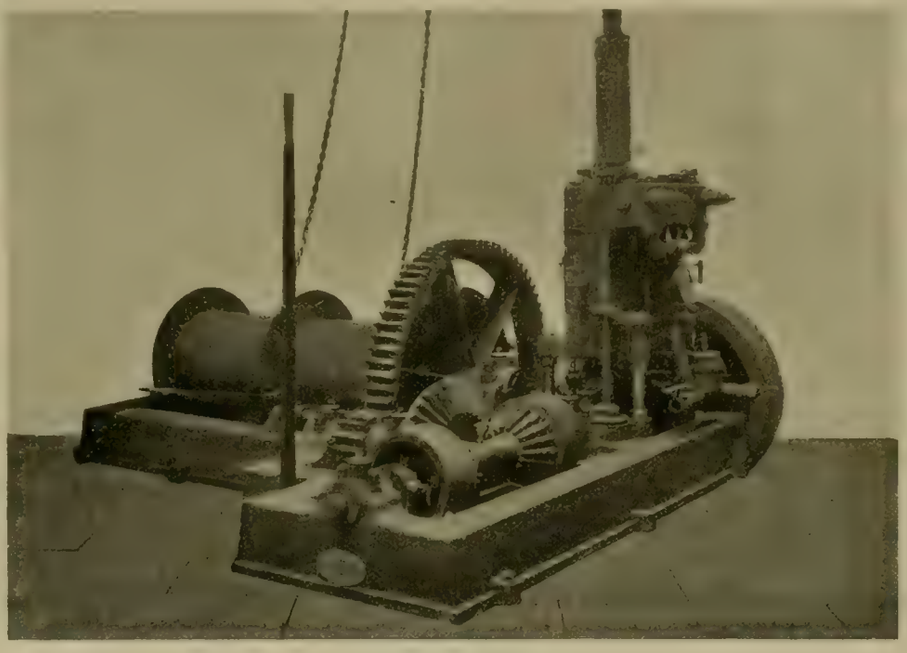
The heavier particles of quartz and fine slimes are precipitated on the rough surface of the belt and carried upwards over the end roll to the wash tank. The continual motion of the belt table, surging beneath the water in the receiving tank, washes the belt clean of all concentrates, which are precipitated in the receiving tank. The concentrator is designed to daily handle 12 to 15 tons of pulp. It can be seen in working operation at the warehouse of I. S. Van Winkle & Co., 413–15 Market St., San Francisco.

THE SPRINGER CONCENTRATOR.

THE Virtue mine, Baker Co., Oregon, last week let a $20,000 contract for 5000 cords of word. This is illustrative of the good a mine is to a community. That twenty thousand dollars will be a Godsend to many a one in that vicinity during days of depression. Wool cannot be sold at Baker City now for seven cents per pound; wheat hardly pays for hauling; all eastern Oregon's products are alike depressed, but fine gold brings $20.67 per ounce and gives employment, direct and indirect, to many who would otherwise be well-nigh destitute.

New Mine Hoist.

The Rosalie Mining Co., whose office is at San Francisco and whose mine is at Arispo, State of Sonora, Mexico, have recently installed in their mine one of the Union gasoline engine hoisting plants, a cut of which is illustrated herewith. This mine is of gold quartz and is reported to be very rich, assaying well up in the hundreds.



GASOLINE MINE HOIST.

The officers of the company are: President, ex-Governor Daggett, of San Francisco; Vice-President, Chas. Yale; Secretary, Hugh Tevis. Directors—John Reid, James McNab, Robert Barnett and C. F. Beverage.

The hoisting plant shown was built by the Union Gas Engine Co. of San Francisco, and, it is stated, is capable of raising one ton of ore at a speed of 125 ft. per minute. It is self-contained, and so arranged that one car of ore is raised and at the same time the empty car is lowered. With one vertical lever the drum is revolved in either direction, or by placing the same lever in vertical position, and, by pressing down foot lever, load can be stopped at any point and safely held.

This form of motive power is rapidly coming to the front for mining purposes, owing to the compact form of the fuel. Three other hoists of this pattern have been ordered and are now in process of construction.

A GOOD word is to be said for the leasing system, which has proved so mutually satisfactory in Colorado and elsewhere. Much of the mining there in the last three years has been done by leasers. The leaser has to be a miner; he can't be simply an ordinary laborer who imagines he must have a miner's wages because he works around a mine. He is jointly interested with the mine owner, and the relationship is of mutual benefit. It gives him an interest in local and general welfare, inculcating thrift and industry, coupled with independence.

Commercial Paragraphs; Obituary; California Mines and Miners, 90. Coast Industrial Notes: Patents; Fourth on the List; Personal; Recent California Mining Incorporations; Recently Declared Mining Dividends, 96.

A Mistaken Policy.

It is not uncommon to receive an item of news from an authentic source saying "the —— mine in —— district, —— county, has been sold to San Francisco people" (or New York or London men). When it is suggested that the value in a news sense of the information would be greatly enhanced by stating the names of the purchasers, and the amount paid for the property, it is generally said: "I'll tell you, confidentially, but the names or amount must not be published." When asked, "Why?" almost invariably the answer is, "Well, they don't want it known." Of course, the confidence is not abused, but the bare, bald statement that "the Copper Gong mine in Bluestone district, Pipeclay Co., has been sold to New York parties, who will develop the property," is of far less value and authenticity than were the paper at liberty to chronicle the sale of the mine "to Brown, Jones & Co., of 38,633 West 343rd street, New York City, for $75,000, $25,000 down, and the balance in one and two years." The first statement is on a par with that class of mining items that says "Johnny Hayes has refused $20,000 for the Holy Terror." The second would carry weight and belief in its correctness. Just why we of California are so shy or reticent of giving names, figures and details in these matters is sometimes a puzzle. In almost any other mining section when a sale is made, be it big or little, the general impulse is to give it the utmost publicity. Here with us the desire has all along been the other way; the general tendency is to keep it as quiet as possible. One can readily understand a desire to have any and every preliminary kept out of print; when a mine is for sale, or being reported on, or negotiations for its sale are in progress, up to the time the whole thing is settled and the money paid and the new owners in legal possession there may be many valid reasons for having nothing said about the transaction. But when the whole thing is settled, and there is no longer the slightest apparent need or reason for concealment, the principals are still desirous to have nothing published concerning exact facts, the result cannot be wholly satisfactory.

The reason may probably be a lack of confidence, a sort of distrust. There are those who would, if they could, upset a trade at any stage of its progress, men who know a whole lot that generally isn't so. Then, too, there is the natural, almost instinctive, desire of a man to keep his business to himself. The benefit, however, is in the case cited of too manifest a nature to justify the usual reserve. Nothing helps a district so much as authentic news and exact published information regarding a bona fide mining transaction, where money changes hands. Nothing is of more tangible value to the adjacent property, and, in one sense, to the property itself. We are not unmindful of any of the possible circumstances. It is thoroughly understood that in a case where a man bonds a mine for $20,000 and sells it for $30,000 he is not particularly desirous of widely proclaiming the fact. The effect of such knowledge on the bondee or the final purchaser might not be satisfactory to any one of the three. All this and kindred possibilities are borne in mind in discussing the matter. But in general it is evident that an accurate statement of the main facts in the purchase and sale of a mining property would be of more benefit, individually and collectively, than the time-honored policy of keeping out of the published account the money consideration.

Time was when a man who bought a mine didn't care to have the fact known lest it might injure his business standing. That time is gone by. The soundest, wisest, most conservative business men of the world are now among the principal purchasers of mining property in this State and elsewhere. It is no longer a discredit to a man to know that he has an interest in a mining property, rather a tribute to his sagacity, an evidence that he knows a good thing when he sees it.

This is not intended as a plea for information. If this paper wanted to it could publish the exact details in nearly every instance. The idea is to note the almost universal policy of repression in this regard. It is not good policy, viewed from any standpoint. It would be better in any conceivable case that the full facts were published, better for the seller, better for the buyer, better for the district, better for the county, better for the State.

Better Transportation.

Increased activity in the mines of California brings increased facilities in everything but transportation. Outside the present lines of railway, travel is about as difficult in many sections as ten or twenty years ago. The fullest measure of success and satisfactory development cannot be attained till improved means of transportation are in general use. Men complain that it takes days to make a trip that should be made in as many hours at less expense and infinitely less inconvenience, and that ordinarily profitable ore cannot be economically handled. Mining properties that under better conditions would pay well and give employment to a large number of men lie dormant. The working of ore at a profit often depends on the one question of cheap transportation.

In this, as in nearly all other things, the matter is purely a commercial one. If it will appear to be a paying project, light lines of railway can be built anywhere and everywhere there is a possibility of profit. Whether there is sufficient promise of profit is for advocates and projectors of such proposed lines to determine. Take, for instance, the forty miles from Oakdale, Stanislaus Co., to Sonora, Tuolumne Co. The latter county is one of those experiencing renewed activity which it is claimed could be greatly increased and permanently maintained by the construction of the line indicated. The narrow-gauge road from Colfax to Grass Valley and Nevada City is a good illustration of the benefit in every way such system of transportation may be to a thrifty mining region. Probably next to the mines themselves nothing has been a greater factor in Nevada county's prosperity than that little road. Supt. Kidder supplies figures that show the enterprise is a fairly paying one.

Colorado furnishes a good example of the great benefits resulting to a State from improved means of transportation to and from the mining sections. That State is gridironed with light railways. The following shows how this matter is looked at in Colorado. The Boulder Co. *Herald* of April 3, 1896, says:

An important project is on foot for this section which will mean much for Boulder and the mountains of this section. It will be known as the Inter-Mountain Railway. The building of this road as outlined by the promoters means much for Boulder city and the county. It will be the starting of prosperous times for this city and county. The construction of this road will make this city the milling center of the mining camps within thirty or forty miles. It is a well-known fact that small mills seldom pay and no one process will handle the ores of this county. The many idle mills in the county will verify this statement. Large mills with combination processes seem to be the only solution to this problem of how to handle our ores at a profit. The building of this railway makes the large milling plants feasible. It is promised the road will tap every mining camp in Boulder county, and a very low rate on milling ores will be given on shipments to this city; 50 cents per ton from the nearer camps and not to exceed $1 from the outside camps. With these rates in force it is estimated the shipments will exceed 500 tons per day when milling facilities are had. We have it on good authority that several responsible parties are ready to build mills on the commencement of work on the railway. The building of this road and mills in the city will also relieve the city of the necessity of stopping by law the building of any more mills on Boulder creek or its tributaries above the head of the city's water supply. Dumping tailings into the creek must be stopped or the water supply of the city is ruined. Our prosperity depends on our mines and mills. To shut off the mills means hard times; to allow them to destroy the water supply means ruin to the city. Happily the railway will solve the problem to the best advantage of all. Owners of mills now in operation can well afford to move their mills to this city. The saving in the cost of fuel alone will soon pay for cost of moving. Another advantage in being located at a central point is that the mills would not be depending on one mine or camp for ore. This would insure the steady running of the mills. The immediate benefit to this city derived from the building of this road will be the employment of all who are able and willing to work, not only on the railway work, but in other directions that will follow the building of the road.

The following is an estimate of receipts and profits on forty miles of the Inter-Mountain Railway between Boulder and Ward, and Boulder and Lafayette.

150 tons milling ore, Ward and intermediate camps to Boulder	$ 100 00
Smelting ore and concentrates, Ward and intermediate camps to Boulder	50 00
Logs, lumber and timber, Ward and intermediate camps to Boulder	60 00
Passengers, Ward and intermediate camps to Boulder	30 00
Merchandise, etc., Boulder to mining camps	40 00
Coal, Lafayette to mining camps	50 00
Coal, Lafayette to Boulder	30 00
Other freight, Lafayette to Boulder	25 00
Passengers between Lafayette and Boulder	30 00
Mail and express	20 00
Paving and building stone	20 00
Total per day	$ 455 00
Per month, 30 days	13,650 00
Per year	163,800 00
Operating expense, 60 per cent of receipts	$98,280 00
Interest on bonds, $240,000 at six	14,400 00
	$112,680 00
Net profit	$ 51,120 00

The above is cited as being analogous to the forty miles between Oakdale and Sonora, in this State. It is thought that $7500 a mile would build and equip such a road. Following is an estimate of the cost of construction and equipment of the two-foot gauge railroad in Boulder county, Colorado, forty-nine miles long:

Organization expenses	$ 1,000
Grading, masonry, trestling and bridging	50,000
Ties, 112,000, at 15 cents	16,800
Rails, 1920 tons, at $32 per ton delivered	61,440
Splices and bolts	3,200
Spikes	2,600
Laying track	6,000
Surfacing, etc	6,000
Frogs and switches	2,000
Water and fuel stations	1,000
Depots and buildings, not to exceed	5,000
Engineering	6,000
Incidental and minor expenses, 10% of labor items	7,500
Total for roadway	$168,540
EQUIPMENT.	
Four locomotives	$ 16,000
One hundred freight cars, at an average of $225	22,500
Two baggage cars	1,250
Two combination cars	1,500
Four coaches	5,000
Miscellaneous cars—hand, push, etc	1,000
Telegraph line	3,200
Total for equipment	50,450
Grand total	$218,990

The above does not provide for an elaborate road, but it would doubtless answer all requirements. In the building of such roads as the one suggested lies largely the problem of successfully working many of the mining sections in this State, now too remote for practical consideration.

THE suggested necessity of a Cabinet officer as Secretary of Mines, recently made herein, bears abundant fruit. Nearly every mining paper in the country indorses the idea, and many personal letters received at this office give abundant reason why action on the matter should be unanimously in the affirmative.

Concentrates.

A CUBIC YARD of coal weighs, practically, one ton.

THE Salt Lake, Utah, mining exchange has resumed operations.

THE *Kootenaian* says the mining stock market in that part of British Columbia is flat. Another bad case of boom.

AUSTRIAN capitalists have representatives inspecting Sierra and Plumas county mines.

THE De Lamar, Idaho, Mining Co. paid a 20 per cent dividend for the year ending June 30, '97.

THE next convention of the California Miners' Association will be held in this city next November.

ABOUT 1000 men are in the Florence, Idaho, district, and considerable development work is being done.

THE Calumet & Hecla mine paid a $500,000 dividend on the 22nd ult., making a total to date of $45,850,000.

A FLAT of all the underground workings up to date is always a good thing for every working mine to have.

THE Morning Star Mining Company, Iowa Hill, Placer Co., last Tuesday declared dividend No. 68 of $5 per share.

AMONG the nations Mexico is the present largest silver producer. The '95 output approximated 51,000,000 fine ounces.

J. C. FRANKS, U. S. Marshal, Alameda, has bonded the Alpine mine, seven miles from San Andreas, Cal., for $25,000.

"CAPITAL and water are mainly needed at Randsburg, Kern Co." The remark is applicable to several other localities.

ACCORDING to the *Miner*, placer miners are busy now on all the streams and gulches of Yavapai county, Arizona, washing out gold.

A PALL of smoke is hanging over the States of Oregon, Washington and Idaho, and much valuable timber has been destroyed.

NEVADA and Montana miners are contributing toward the silver political campaign. At Belt, Montana, a coal mining town, every man gave $5.

THE Mexican dollar has 417.79 gross grains, or 377.17 grains of pure silver. The United States silver dollar has 412½ gross grains, or 371.25 pure grains.

THE public treasury reserve is again reported running low. The private treasury reserve is also somewhat depleted in a good many individual cases.

THE Northwest Mining Association, by its executive committee, will make a mineral exhibit at the Northwestern Exposition at Minneapolis and St. Paul next month.

THE new owners of the Oro Fino mine, near Trinity Center, Trinity Co., are credited with immediate intention to build a 40-stamp mill. The purchase price is said to be $150,000.

THERE are 200 miners at work at the DeLamar mine, Nevada. The daily output is 200 tons. The bullion coach, with four armed guards, makes weekly trips to the railroad terminus.

NEW YORK men propose, if the report warrants, to put in an extensive hydraulic plant at Gold Creek, Elko Co., Nevada, where they have an option on several thousand acres of placer ground.

THE fact that in Michigan they freeze a formation to sink through it and in Alaska they thaw the ground to sink thereon illustrates some of the opposite expedients in practical mining.

THE *Tidings* says that the aggregate motive power at the Allison Ranch, Nevada Co., mine, after the water, electric and steam machinery shall have been put in, will amount to 950 H. P.

INCREASED activity in California mining counties causes a corresponding increase in the assessment rolls, and in one more way indirectly contributes to the prosperity of the entire State.

THE *Union-Democrat* at Sonora, Tuolumne Co., has in its forty-three years seen nearly $100,000,000 gold taken out of that county. It will doubtless see as much more added to the world's wealth.

THE first shipment of crude oil ever unloaded on the Comstock, Nevada, was a carload last Saturday consigned to the G. & S. M. Co., to be manufactured into gasoline for the Silver City mill.

CHICAGO officials are arresting and prosecuting some of the bogus mine "operators" and "promoters" who have been inducing purchase of valueless stock in fictitious companies. 'Twas about time.

JAS. DUFF of this city is the superintendent of the new mining company organized in this city to operate in Corea. The company is securing men at good prices, who take their departure from Tacoma, Wash.

SEC'Y OF THE INTERIOR SMITH has approved two more California land grants to the S. P. R'y Co.—list number 24 and supplemental list thereto in the Stockton, Independence, Los Angeles and Visalia districts.

THE midsummer dullness affects all classes of business, except that connected with gold mining. Makers of mining machinery report that not in years were they so busy as at present, many with orders far ahead.

"IF silver should go to one dollar an ounce" is the hopeful sentence with which innumerable items now begin in the columns of papers published in places once busy with life, now as cold and silent as the ore it no longer pays to work.

THE big irrigation dam across the Mokelumne river broke last Sunday, doing immense damage. It was doubtless an act of Providence. If two gallons of water spills out of a debris dam, it is caused by pure cussedness on the part of the miner.

THE June gold output of the Witwatersrand, South Africa, district was 193,640 ounces, a decrease of 1,368 ounces as compared with the May total and of 7,301 ounces as compared with June, '95. The decrease is locally attributed to the scarcity of coal.

NEWSPAPERS that till recently never admitted the existence of such a thing as a mine now give columns of cullings and comment on mines and mining matters, which exemplifies the popular demand for news regarding the most paying of any present productive industry.

IT is probable that when the present extreme heat has passed in that section the borders of Kern and San Bernardino Cos. will be alive with men attracted by the report of new gold finds. A new ledge is now reported discovered five miles south of the first prospect, in San Bernardino county.

OUR contemporaries who are advertising the more or less wonderful statements of the Hartzfeldt Reduction Co., to the extent in some instances of half a page, should make some inquiry as to the authenticity of what is claimed therein. 'Tis a duty they owe to their subscribers.

THE Ute and Ulay mine at Lake City, Colorado, has been closed down by the order of F. S. Underwood, assignee of the Mines Leasing Company. The mine has been giving employment to 250 men and paying $30,000 per month in wages. The *Investor* says no cause is given out for the stoppage of work.

CALIFORNIA next November elects nine men to cast the electoral vote of the State in the real "presidential election" in January, '97. There will certainly be 27, probably 36, names on the ballots voted in this State next November. The nine receiving the most votes will represent California in the electoral college.

ABOUT 30 miles southwest of Port Arthur, Ontario, are what is said to be the only silver mines on the continent, under British dominion, that have produced silver in considerable quantities. Brill and Blum, two French mining engineers, are now examining them with a view to their purchase and resumption by French capital.

VANDERBILT, San Bernardino Co., is reported to be reviving. A. G. Campbell has ordered machinery to the extent of $60,000. The Boomerang, which is now down nearly 600 feet, will be run down 500 feet farther, which will, it is thought, uncover ore and develop water to assist in working it. The 10 stamps now working will shortly be doubled in number.

THE *Mining Investor* says that a mining engineer just from Cripple Creek was asked by another concerning the situation at the camp. "Oh, they are doing the same as usual," was the reply; "the tenderfeet are taking the ore out, where they find it, and the mining men are hunting for it where it ought to be," which is hardly fair to the "mining men."

LOCAL geologists in Plumas county advance the plausible theory that before the upheaval of the Sierra Nevadas a river was running through the United States from north to south down into Mexico, and even South America, and that the rich diggings on the American, Feather and Yuba rivers resulted from the cutting of these rivers into the ancient river bed that they cross.

RETURNING miners from Alaska say a good many hard things of that section. In the early part of the year nothing too good could be said by some of the same people. The truth lies between. Alaska didn't deserve the glowing eulogies it received, nor does it deserve the present condemnation. There is gold there, but it is not an ideal El Dorado; it is not California by a large majority.

THE Populist national nominating convention at St. Louis sat down on Senator Stewart of Nevada and incorporated a plank declaring for the miners in the effort to prevent wholesale absorption of the mineral area. Though they are "away sale absorption of the mineral area. This first public recognition of the kind in the history of national nominating conventions is worthy of passing note.

UNUSUAL cloudbursts are reported from the high Sierras in this State, from Nevada, Utah and Colorado. In addition to the usual destruction occasioned by the rushing water, there is a source of loss in the latter State by railroad washouts which involve temporary suspension of work in several mining towns. Ore shipments are interfered with, and in some cases the supplies of provisions, etc., are cut off.

J. LONGABAUGH of Carson, Nev., is a man whom "slickens" have made rich. Years ago he got a U. S. patent for some land near Bellville, Nev., but it wasn't worth paying taxes on. Since then thousands of tons of tailings have spread over it, and, an improved process of working them making them profitable, Mr. Longabaugh will get more for his land than had it proved ordinarily rich below the surface.

ON the Comstock, Nevada, has recently been milled ore from the 3250-foot level, now under water. At present no work is being done at a greater depth than the 1700-foot level, where the Sutro tunnel tapped the lode. It is not an unusual route for travelers from Virginia City to points more easily reached that way to go down by vertical shaft to a distance of 1700 feet, thence five miles through the tunnel.

A TWO-COLUMN ARTICLE containing a condensation of alleged facts concerning the production of gold and silver recently appeared in the leading paper of the middle Mississippi valley. Seldom has been published anything of the kind containing so many errors. It is three years behind the times and is full of mistakes. It is being widely copied all over the country and disseminates a more than ordinary amount of misinformation.

AT the meeting of the U. S. Debris Commission last Monday, permits for hydraulic mining were granted to the owners of the Ellen Taylor mine, near Indian Diggings, El Dorado Co., and the Merlow mine, near Sonora, Tuolumne Co. Permits to construct dams for impounding debris were granted to the owners of the Cook gravel mine, near Jamestown, Tuolumne Co., and to the Omega mine, near Washington, Nevada county.

CONSIDERABLE local interest is manifested in the drilling now going on in the lower levels of the Mercur, Utah, mine, with the expectation of striking telluride ore. It is believed there that before the proposed depth of 1560 feet has been attained native tellurium and telluride will be found. Native tellurium is of very rare occurrence. It is found chiefly in Transylvania and has been reported at various places in this State and Colorado.

ACCORDING to a local paper Nevada City has a beer mine, The man at the windlass said: "You see, we've been engaged to clean out this old shaft to be used as a well by the landlord yonder. As we dig down we strike bottles of beer—that is, our partner finds them. He has only let us see a half dozen of them so far, but if the supply don't run out soon he will be in condition to turn his job over to us, and be hauled to the top in a bucket." For years the hotel man used the shaft to keep his beer cool in.

THE powder output of the California companies for last July was nearly three times what it was in July, '93. About 90 per cent of dynamite used by the mining companies on this coast is known as No. 2, or 40 per cent nitro-glycerine. This now sells at 8 cents per pound, net cost, which is a big reduction. The companies say they can hardly supply the demand, that there is no money in the business, and they don't care for new customers. The powder costs the individual California miner 10 cents a pound The same powder costs the Australian miner 37½ cents per pound.

THE rock drilling contest at the State Fair next month will be in charge of three judges. Six prizes will be awarded, one a purse of $400, $250 to winning team, $100 to second, $50 to third in a double-hand contest on a down hole in Folsom granite. A second purse of $400, $200 to winning team, $100 to second, $50 to third, will be given for a double-handed contest on a one-half upper-hole at an angle of about forty-five degrees. The rules and regulations were published herein last Saturday. All entries close Sept. 1st. Letters postmarked that date will be received. An entrance fee of $5 for each man will be required. The contests begin Sept. 7th, at the Pavilion, Sacramento. No one anywhere is barred.

ON July 1st the amount of silver dollars in the Treasury available for the redemption of Treasury notes had become reduced to $10,659,582, and was further reduced by redemption during the month. The coinage of silver dollars by the mints will be increased from 1,500,000 to 3,000,000 per month from today. From the first of March, 1893, the Treasury has held 29,390,461 standard silver dollars for the redemption of Treasury notes issued under the act of July 14, 1890. Since the first of March, 1893, the coinage of silver dollars has aggregated $11,983,056. Of this sum, $2,311,677 was profits on seigniorage, leaving $9,671,379 for the redemption of Treasury notes. The amount of Treasury notes redeemed in silver dollars and canceled from November 1, 1893, to July 14, 1896, was $28,402,258.

A MONTANA subscriber pays us the unique compliment of asking that the advertisements in this paper be so arranged that a page of advertisements shall be printed on the obverse side of a page of "reading matter." The reason for the unusual request is that he "wants so often to cut out something good," and finds after he has cut it out that there is something equally good on the other side that he cut in securing the first item. Probably the better way to do would be to follow the example of so many thousands of our subscribers who weekly file the paper for reference. As to the advertisements, rightly considered they are of at least equal value to the reader. There is no news in the paper of superior interest to the announcements of the men who make and furnish the latest and best in all that mining men require.

MADDENED by exposure fraudulent mine schemers are threatening British Columbia mining papers with libel suits. That is something any straight mining paper must always expect. It is the duty of a mining journal to expose fraudulent mining schemes, and it is natural for those whose plans are upset to vehemently protest. Wherever and whenever there is any activity in legitimate mining there will be found men trying to take unfair advantage; 'tis so in politics and all forms of business. The British Columbia papers have nothing to fear so long as they confine themselves to the facts. They will earn deserved public confidence and have what is dearer to any reputable journal than money—good character. Such a paper as the Rossland *Miner*, for instance, is of more value to the district in which it is published than can be accurately estimated.

THE Supreme Court of California this week handed down a decision, in which the judgment of the lower court was reversed. It was the case of W. S. Howeth, plaintiff, J. C. Sullenger, et al., appellants, in an action to determine rights of parties to mining claim. Section 2324, U. S. Revised Statutes, provides that "the location must be distinctly marked on the ground, so that its boundaries can be readily traced," but does not prescribe how it shall be marked. The matter is left to the regulation of the local laws. Held—"Any marking on the ground claimed by stakes and mounds and written notices, whereby the boundaries of the claim located can be readily traced, is sufficient." When the ultimate fact is found, no finding of probative facts which may tend to establish that the ultimate fact was found against the evidence, can overcome the principal finding.

R. W. WOODBURY, president of the California Eastern Railway, located to run from Los Angeles through southeastern Nevada to Utah, which has thirty miles built, thinks that the mineral resources alone justify the rapid extension of the road eastward. The difficulty has been to prove the existence of the ore in paying quantities, and to do this he has organized a company which will build traction wagons, to be operated by steam and run on the surface of the ground. These are now being built. With what can be carried on the wagons themselves and on trailers, he expects to haul fifty tons at a trip. This is only an experiment which has not yet been proved. His theory is that when it is found that the ore can be transported reasonably the mines will be worked, and if the mines are once put in operation in the country he can show that there is enough ore in the country to justify the erection of a railroad.

BY a two to one vote the miners of Lump Gulch, Montana, have decided that they do not wish to be longer compelled to board at the company boarding houses, and have served notice on the mine owners that on and after August 1st they intend to board where they see fit. They feel that it is unjust to compel a married man to board at the company boarding houses, where it costs on the average about 33 cents a day to feed him, and then charge him $1 for it. It has the effect of compelling a man to keep up two establishments, and after he has paid his bills at the end of the month he has not much left to show for his labor. On the other hand, where a man is straining every nerve to develop a property, and putting every cent he can rake and scrape into it, and giving employment in the meantime to all the men he can employ at the going rate of wages, he should be helped and encouraged in every way possible.

THE specific weight of magnesium is about two-thirds that of aluminum, viz., 109 pounds per cubic foot. It melts at 811° Fahr., and has electrical conductivity equal to 41.2 per cent of that of pure copper. Its tenacity ranges from 23,000 pounds up to 32,000 pounds per square inch. Its elastic limit in the shape of wire is about 8770 pounds per square inch, and its elastic modulus about 1,945,000 pounds, or less than that of most stones. The cast metal has a much lower tenacity, ranging from 9640 to 13,600 pounds per square inch. Alloyed with aluminum, up to 10 per cent of magnesium, it increases the strength and elastic modulus of the former metal, but greater additions yield a weak and brittle alloy. Professor Thurston states that, so far as he knows, all attempts made to form an alloy of copper and magnesium have completely failed, though much time and trouble were spent on the matter.

The "Inventive" Faculty.

'TO THE EDITOR:—The interest manifested in the attempts of the writer to suggest a rational answer to the question, "What is invention?" in the articles, "Is the Inventive Faculty a Myth?" *Engineering Magazine*, August, '95, and "Invention the Indefinable Requirement of the Patent Law," MINING AND SCIENTIFIC PRESS, May 4th–11th, '96, is apparent in the widespread reproduction in the Eastern papers and magazines, in those of Europe, Australia and faraway South Africa, and, further, in the still more numerous comments and criticisms thereon. This interest confirms the opinion, expressed in those articles, of the profound importance of a correct understanding of the subject. The legal aspect is but secondary to its bearing on education and general progress.

Hitherto the writer has refrained from replying to adverse criticisms, except in an indirect way in the second article, to such as appropriately fell within the scope of that discussion.

Many of the comments, though earnest, lacked point or pertinency; others, again, were anticipated and sufficiently answered by the articles themselves. The remainder, which, on account of the authoritative character of their source or other reason seem likely to cause misconception in the minds of those who have not carefully read the articles, should be answered. Earnest appreciation of the importance of the matter impels an endeavor to reply to all such criticism. This, for obvious seasons, is impracticable; but, fortunately, in the able editorial comment of *The Engineer*, London, England, May 29th, '96, and *The Engineering Magazine*, New York, July, '96, is embraced the general tenor and substance of this latter group. A reply, therefore, to these will sufficiently cover the ground. To the former an answer has been made in its own pages, which will appear in these columns at a later date.

It is to the remarks of the latter paper that attention would now be particularly called. The criticism of *The Engineering Magazine* opens with a discussion intended to answer the general import of the paper, "Invention the Indefinable Requirement of Patent Law." The separate propositions are then taken up seriatim. This same orderly sequence will be here followed.

The opening statement referring to the admittedly indefinable character of the word "invention" says: "This, however, does not prove that the word is not useful, or that its use is always or even generally misleading. For example, the two words 'animal' and 'vegetable' are in common use, and we could not dispense with them or some substitute for them; yet neither of these words is exactly defined, and there are cases of disagreement among experts as to the proper classification of some living things."

At the outset this shows a misconception. The suggested elimination of the word "invention" from the patent statute and practice was not based merely on its indefinableness, as the writer of the criticism would seem to have assumed, and against which erroneous assumption the introductory argument is almost wholly directed. The substance of the article in effect was, if "invention," as interpreted by the courts, patent office and text book writers, is a myth, difficulty and confusion must accrue in an ever increasing degree, as from the requirement of an impossibility in any other contract. The difficulty and confusion were clearly shown in the conflict of authorities with themselves, with common observation and common sense. Attention was called to the acknowledged impossibility of defining the word "invention" as further tending to show that the authoritative interpretation has no foundation in fact. It is, therefore, beside the issue to cite other words which, though indefinable, have an *unchallenged* foundation in existence. The illustrations of my critic are in no way parallel. The *existence* of "animals" and "vegetables" is obvious and unquestioned, whereas the existence of invention, on the contrary, *is* questioned. That these classes of animate things merge imperceptibly into each other is an interesting biological fact, but it has no bearing on the present matter. The same may be said of the words "life" and "death" and the many others referred to generally. A just and unanswerable criticism would show error in data employed, or conclusions reached, or facts proving the existence of "invention" as authoritatively interpreted.

The propositions which the present writer aimed to establish, taken up separately, are:

First—That though the third requirement (invention) has always been in the statute, and its meaning substantially the same as the present interpretation, until recently it has practically been a dead letter.

The accuracy of this statement is questioned thus: Examiners in the patent office, if competent, have always taken this point (of invention) into consideration, and have decided it one way or the other, as best they could, within the limitation of their knowledge and capacity for forming judgment. As this involves a question of fact, it can hardly be settled by argument. Patent solicitors, however, and those having dealings with the patent office, will without exception bear me out in the statement that until comparatively recent times a rejection for want of "invention" was practically unknown, and that now it is a common ground upon which applications for patents are now rejected. Readers will draw their own inference. The proposition simply states an obvious one. The point, however, is immaterial. The main issue is *not* if officials endeavor to carry out the law, but whether the statute demands an impossibility or not.

Second—That it is not by any means axiomatic that the third requirement is in any case possible of fulfillment; but, on the contrary, there are many cogent reasons for questioning whether "invention," like "spontaneous generation," is not a metaphysical myth.

This proposition, which in reality involves the essence of the whole contention, my critic leaves severely alone, barring the assertion that, notwithstanding the difficulty acknowledged to be experienced by authorities and experts, "an average man, by the exercise of common sense and judgment, would determine whether the subject of a patent is either in whole or in part the result of invention or not."

What it is pertinent to ask is the characteristic which would enable any one—judge, examiner or "average man"—to distinguish the work of the "inventor." A justice of the Supreme Court, after complete investigation, doubtless, of all the data, says it is an "impalpable something." The patent office examiners, who are experts in detecting its absence, notwithstanding reiterated invitations to enlighten us, are dumb as oysters as to what it is like which they do not find; and my critic, too, who says that any "average man" with common sense can see it, even he is tantalizingly silent as to what this "average man" will see. There are a host of attorneys, specialists in patent law, and others of capabilities high above the "average man," who would sacrifice much to share with the "average man" his perspicacity in this particular.

For more years than he cares to think of the writer has been a student of mechanics, engaged continuously in solving mechanical problems and designing machinery incorporating such solutions, many of which are covered by patents of the broadest scope. But as the result of thorough and painstaking investigation from the most practical standpoint—that of the expert witness—he is compelled to adopt the view that invention as interpreted by the courts, text book writers and patent office is a myth, and that there is no distinction characteristic of invention. The difference between the productions of individuals is only such as are attributable to varying degrees of knowledge, skill and reason.

My critic's "average man" would simply determine the question as judges do now, by his ignorance. If the device under consideration was complicated or outside of his usual experience, its production would involve "invention;" on the contrary, if simple or closely connected with his usual experience, then, of course, it is merely "the expected skill of the workman," and as such would not involve "invention."

Third—That even if it be in fact a real quality it has never been defined; nor is it of such character that its presence can in any case be determined beyond doubt. All authorities agree that "questions of invention proceed upon fine and subtle metaphysical distinctions."

This is admitted as true by *The Engineering Magazine*.

There is an astonishing lack of unanimity of opinion among magazine commentators and critics on the various propositions advanced by the writer in this discussion. Those admitted by some are scouted by others, and contrawise; and, again, all are approved by others. Men like the late Franklin L. Pope, but recently an honored collaborator of my present critic on *The Engineering Magazine*, and John Richards, than whom as an authority in his specialties there is none higher, and many others, also, whose opinions carry weight in the world of mechanics and invention, accept and endorse all propositions advanced by the writer in this connection; so that by a process of elimination or cancellation, pairing off each acceptance of a proposition with a rejection of the same, the writer's position would remain practically unassailed, strengthened by many able and authoritative supporters.

San Francisco, July 16, '96. W. H. SMYTH.

(To be Continued.)

NEW GUINEA is a gold field which is not unlikely in the future to attract much more attention than it has in the past notwithstanding the formidable obstacles which oppose successful gold mining there. There have been many expeditions into that country, but the dangers they have encountered have far outweighed their gains, and success, therefore, has rarely rewarded efforts of the gold seekers. But these various attempts were not attended solely with failure. They made the way easier for succeeding adventurers, until, at last, some small, yet promising, measure of success has resulted. Some time ago a party of Queensland prospectors reported that they had discovered payable gold on the Membare river, but at the time it was not generally credited. But now it has been confirmed by the arrival in Sydney of a member of the party, who asserts that in the headwaters of the river gold was discovered in large quantities.—Mining Journal.

A Representative Californian.

On this page appears a good portrait of Julian Sonntag, the secretary of the California Miners' Association. Mr. Sonntag has also just been unanimously elected as the president of the Manufacturers and Producers' Association. He is the general manager of the Giant Powder Co. and a representative California business man.

JULIAN SONNTAG.

New Theories Wanted.

As information is acquired concerning natural phenomena it becomes more and more evident that many of our most treasured theories and explanations will have to be thrown on the scrap heap of scientific hypotheses. The researches of Lord Raylegh in argon and helium have already demonstrated that there is much in the received molecular theory of gases that will have to be rejected as untrue. The Roentgen rays have done the same thing for light, and now Prof. Dewar has shown that as yet nothing like a satisfactory theory of electricity and magnetism has been framed. A recent discourse at the Royal Institution, London, delivered by Prof. Fleming, was mainly a statement of the very remarkable results obtained in the course of a series of experiments carried out by himself and Prof. Dewar on electrical conduction at low temperatures. It is not too much to say that these results go far to upset all our preconceived notions, and tempt us to ask if the phrase "conservation of energy" conveys any adequate idea whatever of any natural processes. Thus, for example, Profs. Dewar and Fleming seem to have established that a pure metal at absolute zero would have no electrical resistance, so that the smallest filament could carry the most enormous conceivable current without being heated. Some time since he stated that it was quite conceivable that a magnetic screen might be produced, and that if it was produced we should be within measurable distance of perpetual motion; in other words, of a machine which could work itself. Prof. Fleming stated that a pure metal at the absolute zero would form an absolutely opaque screen to electro-magnetic radiation. But the whole lecture bristled with statements going to show that there is no apparent connection between causes and effects, and that the expenditure or not of energy in the performance of process is brought about in ways of which we know nothing. For instance, it is impossible to send a current of electricity along a pure metal at normal temperatures without loss of energy. We have only to bring down the temperature to zero, and the loss of energy ceases. What is the connection between the heat in the wire cone and the expenditure of energy? As the years roll on science seems to drift closer and closer to the rocks of agnosticism; and the man who studies and experiments most will in the end be he who knows least.

A GREAT grievance of the engineering profession is that anyone, however inexperienced and incapable, can write after his name the letters C. E. or the symbol M. E. Similarly, anyone can describe himself as a metallurgist or a mining engineer without incurring any penalty. A recent writer has pointed out the absurdity and injustice of the fact that the lawyer who gets his fees whether he wins or loses his case, and the doctor who buries his mistakes under ground, are protected by a law which prevents unfair competition, while the engineering profession, holding, as it does, under its care millions of lives each day, is open to the irresponsible warfare of anyone who may choose to hang out a sign styling himself an engineer, whether he poisons a city with bad water or runs a sausage machine. The grievance is a real one for those who have devoted much time, labor and outlay in qualifying themselves for an arduous and honorable profession.

Scientific Progress.

The Aerial Torpedo.

The aerial torpedo is a small-sized gas-filled balloon, capable of sustaining indefinitely from 30 to 40 pounds at an elevation of from 500 to 1000 feet above the earth. Inside of the lower or small end of the balolon is placed a metal cylinder, which contains an electrical device, the purpose of which is to ignite the gas in the balloon at any stated period. Underneath the balloon is suspended a case or basket containing a high explosive similar to dynamite, which explodes with terrific force when striking a hard substance, like the earth or walled embankments. In action the management of the torpedo is described as very easy and simple, the inventor stating that a corporal's guard can with it accomplish what would require a large force to do by the usual methods now employed in the siege of cities, of the scattering of large bodies of troops. The torpedo complete is small and compact, and a large number can be carried by a few men and a pack animal.

The gas to inflate the balloon is carried in light or metal cylinders, enough being compressed in one cylinder to inflate a large number of aerial torpedoes. To use the aerial torpedo effectively all that is necessary is to approach as near as possible the locality where the torpedo is desired to take effect, and to ascertain the direction of the lowest air current and the velocity of same per hour. The length of time it would take for the air current to carry the torredo over the objective point can thus be ascertained, and the electric device set at the proper hour or minute. The balloon part is then inflated, the torpedo released, and the air current will convey the torpedo to the point desired. As soon as the time has expired as set in the electrical device and electric spark will ignite the gas in the balloon, causing it to explode, when the torpedo will drop to the earth. The explosive striking the earth or any hard substance will cause serious damage in that locality. In the siege of cities the aerial torpedo, the inventor believes will be especially effective, as no defense can be made against it, and it can be used in the night as well as by day, and by a few men of ordinary intelligence.

AT the present day the seas have been thoroughly explored except in the polar regions. An immense extent of the land, however, is entirely unknown; an even greater area has been only imperfectly explored; while only a comparatively small portion is so well known as to be covered with a network of triangles and completely mapped. After the Arctic and Antarctic regions, the part of the world least known to us is Africa, notwithstanding the explorations of this century. Next to Africa, Australia offers the greatest field to the explorer, even its coast not having been fully explored until 1843, while it has not yet been traversed from east to west, although once crossed from north to south. Except in the extreme northern and southern parts, the two Americas have been explored, but the whole central region of South America is practically unmapped. Of a total of about 20,000,000 square miles yet unexplored, Africa contains approximately 6,500,000; Australia, 2,000,000; America, 2,000,000; Asia, 200,000; Islands, 400,000; Arctic regions, 3,600,000; Antarctic regions, 5,300,000.

TO THE question, "If light originates in our atmosphere how is it that we see the sun?" Prof. Foster answers: Light, heat and electricity are interchangeable, the one always changing to the other two. The sun's magnetic forces come in contact with the carbon in the sun's atmosphere, and light results. These magnetic forces cross the dark spaces between sun and earth, no conflagration resulting and no light, because the carbon in space is not sufficiently dense. But on reaching the earth's atmosphere the magnetic radiations ignite the atoms of carbon and we have light in some unknown manner that possibly may yet be accounted for by the X rays' magnetic radiations that intervene through the dark, cold space between the sun and the earth. The X rays clearly demonstrate that shadows are caused by shutting of the magnetic rays, and this indirectly proves that light is caused by magnetism.

OZONE is becoming an important industrial agent. It artificially ages liquors, removes the effect of oily beans in coffee and improves tobacco. In its late application to the rapid seasoning of wood for sounding boards and musical instruments it increases the resistance of the wood to temperature and moisture, and adds to its acoustic qualities. It thickens linseed oil for linoleum in a few days, whereas the old method of oxidation often took several months. It bleaches linen in less than a third of the time required by sunlight. It is also valuable in chemical and technical processes, especially in purifying starch derivatives from undesirable color, odor and taste.

NO OTHER man is so overwhelmed with a sense of human weakness as he who strives to grasp Nature's mysteries. Hence it is that, while we boast the scientific triumphs of the last half century, and the world heaps honors upon the head of one of the greatest leaders in this progress, Lord Kelvin himself declares that his jubilee celebrates his failure. "I know no more," says he, "of electric and magnetic force, or of the relation between either electricity or ponderable matter, or of chemical affinity, than I knew and tried to teach my students of natural philosophy fifty years ago in my first session as professor."

Electrical Progress.

T. W. YOUNG of Washington has invented an electric heater to be lowered into an oil well. The idea is to generate electricity in large quantities, so that the refuse matter, which clogs the pores of the oil stone, will be melted and run out, causing a fresh upward flow of oil. The theory as to the exhaustion of so many wells is that the oil, in passing upward through the stone, has clogged the porous stone with paraffine in such quantities that the further flow is stopped and the well ceases to produce. Some think that it is because the supply in the earth has given out, but the generally accepted idea is that the oil is still abundant and only ceases to flow when the exit is stopped. It has been common to use torpedoes to shatter the stone at the bottom of the well, thus breaking up the clogged matter, but this is an expensive process. By the Young method, the machine, which is about three feet long, and resembles an iron cartridge, is placed at the bottom of the well and electricity produced of sufficient voltage to produce an enormous heat without melting the metal. "The current goes down the wires; and by the peculiar construction of the carbon-packed chambers, the intense heat is radiated into the rock in all directions, the paraffine and other refuse is softened and melted so that it runs, and when the well is started a fresh flow occurs just as strong as when it was first sunk."

THE first electric locomotive of any considerable size built in this country and what the General Electric Co. consider the first practical electrical locomotive in the world, with a rated draw-bar pull of 7000 pounds, has been purchased by the Manufacturers St. Ry. Co., of New Haven, Conn. It is equipped with air brake and is being prepared for shipment from the Schenectady works. Its total weight is thirty tons; it will be utilized to haul freight cars from the junction of the New York & New Haven railway one mile from the New Haven passenger depot, to the works of the manufacturing establishments located along that water front. The freight cars will be hauled directly into the yards of the manufacturers, and the loads will be collected by the electric locomotive and hauled to the main line of the N. Y. N. H. & H. R. R. where they will be taken up by the steam locomotive for transportation to their destination. The length of the line along which this locomotive will run is nearly two miles, the maximum grade against the load being about 2½ per cent. The guaranteed speed of this locomotive on this grade will be seven miles an hour with a heavy load behind it, but judging by its performance at the Lynn works of the General Electric Company it will probably be able to largely exceed the guarantee. The matter of electric traction on the steam roads since the successful operation of the elevated roads in Chicago, the branch lines of the N. Y. N. H. & H. R. R. and the B. & O. main line, with apparatus developed by the engineers at the Schenectady works, has elicited the interest of steam railroads all over the world.

THE new highway bridge across the Connecticut river connecting Middletown with Portland, Conn., is now swung by electricity. The electrical equipment consists of four G. E. 800 motors. Two of these are connected with the swinging mechanism, one working and the other being held in reserve. Of the other two, one is located under each end of the turning span, to raise it from the fixed piers before the third motor begins to swing it. The bridge span is 450 feet long—the longest single span highway bridge in the world. Previous to the installation of this electrical equipment fifteen men were required to start the bridge and eight men to swing it.

Appreciates a Good Thing.

ENRIQUE ALLCHURCH, INJENIERO.

Buenos Aires,
Las Heras 289.
June 15th, '96.

To the Editor of the
Mining and Scientific Press,
220 Market St., N. E. Corner Front,
San Francisco, U. S. A.

Sir:

In the hands of my old friend, Dr. Davison of the "Minas de Corrales," in the Uruguay Republic, I have lately seen your paper, about the most complete thing of its kind I have seen, and as an old mining engineer in these parts I am eager to possess it. I enclose draft No. 495 for eight dollars, U. S. coinage, which, if I understand aright, will pay two years' subscription.

Kindly acknowledge and send papers to the following address:

Senor Injeniero Enrique Allchurch,
Las Heras No. 289,
(Argentine Republic) Buenos Aires.

2nd of draft by next post; meantime believe me

Yours sincerely,

Enrique Allchurch

Mechanical Progress.

M. ARNOLD, inventor of the Arnold oil motor cars, speaking recently on the benefits that farmers would derive from the the motor cars, at a meeting of the Maidstone, England, Farmers' Club, stated that the motorcars would be of great service to the agriculturist but not if the bill before Parliament was allowed to pass in its present form. Farmers ought to be allowed to draw another vehicle behind. He was confident if a few alterations were made in the bill that the motor cars would do the work of light railways much more efficiently and thus save the country a lot of expense because they would run direct to the farmhouse, which railways could not do unless special sidings were constructed at an enormous expense on the farms. Motor cars could also carry loads to and from the fields, which would again be impossible with light railways. The expense to farmers would be considerably less, as four or five cwt. could be drawn a mile for one half-penny with the use of petroleum.

AN experiment was recently made in Vienna in order to test the relative resistance, under pressure, of the hardest steel and the hardest stone. Small cubes of corundum and of the finest steel were subjected to the test. The corundum broke under the weight of six tons, but the steel resisted up to 42 tons. The steel split up with a noise like the report of a gun, breaking into a powder, and sending sparks in every direction, which bored their way into the machine like shot.

CHICAGO is to have the highest tower in the world. The *Journal* says it will be 1150 feet in height, on a base 350 feet

square, and in comparison with it the Eiffel tower will be but a dwarf. It will be built by the City Tower Company, between Throop, Loomis, Harrison and Congress streets. It is said the tower can be built for a third less than the Eiffel tower, which cost $1,200,000. Thirty-five elevators will carry people to the different stages, where every sort of amusement will be provided, from continuous performances to pyrotechnic displays and air-ship flights by reckless inventors.

SINCE the Crimean war the charges of powder in guns, according to Sir Benjamin Baker, have increased from 16 pounds to 900 pounds; the weights of projectiles from 68 pounds to 1800 pounds, and the energies developed from 1100 foot-tons to 62,000 foot-tons. The British navy has been entirely rearmed since 1882, the Armstrong muzzle-loading wrought iron coil gun having been replaced by the breech-loading steel gun.

THREE Russian engineers have been in Philadelphia, and are now traveling west, who have made a contract for $500,000 worth of machinery. It is proposed to erect a great plant at Nijni, Russia, to build steam locomotives. Machinery will be bought in thirty different cities, reaching several million dollars in value. At present nearly all Russian Government railroad locomotives are built in Philadelphia.

THE Paris, France, Municipal Council thinks it desirable that not only should the tramcars be drawn by mechanical power, but that the omnibuses should also be replaced by horseless vehicles and is negotiating with the Omnibus Company to make the change. This is an official certificate of the highest character to the practical commercial success of motor carriages for ordinary road use.

Practical Information.

Measuring Candle Power.

People are desirous of a simple method of measuring the lighting power of a flame. The question how many candle power a lamp has can be settled without any great difficulty. The surest results are obtained by means of a grease spot. In its most simple application, the experiment can be tried easily at home. A sheet of white paper, with a grease spot in the center, is put into a frame and placed between two flames of different lighting power; for instance, between an ordinary stearine candle and a petroleum lamp. When the frame is equally distant from the two unequally bright flames, the grease spot can be seen plainly on both sides. By moving the frame with the sheet of paper slowly toward the less bright light, that is, the stearine candle, it will arrive at a point where the grease spot has apparently disappeared on both sides of the paper. This illusion always exists when an equal lighting power prevails on both sides of the paper, and there is no side light. This is the point at which to determine how much stronger is the light of the lamp than that of the candle. If the candle is 20 inches from the paper and the lamp is 60 inches, and yet both sides of the paper are equally bright, the light of the lamp will be as strong as that of nine candles. The calculation is based upon distances, the figures of which are multiplied by themselves, and then divided. In this case, for instance, 60 multiplied by 60, divided by 20, multiplied by 20, equals 9. This, of course, is a very primitive method, but it embodies the principle utilized in the delicate measurements of the laboratories. The grease spot always remains the base of the modern instruments for measuring light, whether it is replaced by milk glass, or it appears as an ideal grease spot in the place of an uncovered point of a mirror. The unit for measuring light is now the so-called Hefner candle. This candle consists of a wick, saturated with acetate of amyl. Its flame has a height of 40 millimeters. It is used more particularly when the sources of light possess naturally a certain similarity. The comparison of the power of red gas light with that of white arc light or incandescent light is made most accurately by special instruments.

AMONG the advantages claimed for paper tiles, one of the latest products of the wood-pulp industry for roofing purposes, are their light weight, exceeding hardness, and non-conducting of heat and sound, and sufficient elasticity to meet all the requirements. There is also freedom from the dampness usually experienced in the case of stone. The new material is pronounced superior in quality, appearance and price, and from an insurance standpoint seems to be regarded as safe and satisfactory.

THREE German engineers, in discussing a recently proposed plan for operating a street railway with gas, estimate the cost of a street railway equipped for gas operation would cost $28,560 per mile. The cost of the gas road at Dessau was $27,798.40 per mile. A 10-horse power gas tramway car uses about thirty-two cubic feet of gas per car mile.

INVESTIGATION has lately demonstrated that coal may lose as much as 33.08 per cent in weight from exposure to the weather, while the loss is made even more considerable by the deterioration in quality.

IN tropical forests so large a proportion of the plants are of the sensitive variety that sometimes the path of a traveler may be traced by the wilted foliage.

A UTAH inventor claims that by methods devised by him onyx can be used as a substitute for lithographic stone.

Commercial Paragraphs.

THE Risdon Iron Works will next week ship a complete air compressor plant to the Leonard mine for the Boston & Montana Co.

GEO. E. WOODBURY has just returned from Calaveras Co., where he has been placing seven Woodbury concentrators for the Carson Creek Mining Co.

THE Prospective Mining & Machinery Co. of this city shipped one Tremain steam stamp mill to J. M. McKearnan, Porterville, Cal., on the 20th inst. This mill is making its way among practical miners.

A. BARNES, manager of the California Stump Puller Co., is this week shipping a complete stump-pulling outfit to Guaymas, in the State of Sonora, Mexico. It is claimed that these machines can't be stumped.

—The California Electrical Works, whose place of business has been at No. 35 Market street for so many years, has secured a more commodious establishment at 409 Market street, into which it will move about August 15th, increasing business necessitating more extended facilities.

THE Edward P. Allis Co., 9 Fremont St., S. F., has an order for the complete machinery of a new reduction works to be built in Colorado, including the engine, boilers, crushers, rolls, concentrators, chlorination barrels, etc. The sawmill department has had an order placed with them for the complete machinery of a large sawmill for northern California.

THE Westinghouse Electric and Manufacturing Co. has made a contract with the Baltimore, Cantonsville and Ellicott City Railway Co. for thirty-two 100-horse power and twenty 30-horse power electric motors for its new railway. The heavy motors will be used for long runs between Baltimore and Washington and the smaller ones for short runs in the city.

THE Sullivan Machinery Co. of Chicago have appointed Knight & Stone agents at Rossland, B. C., to introduce their diamond and rock drills in that section. While the agents have only been representing the Sullivan Machinery Co. a short time, they have met with flattering success. The style of drills made by this Chicago house seems to be adapted for work in that territory.

THE International Correspondence Schools, at Scranton, Pa., under date of July 1st, writes: "Our schools were never so popular as at present. We have just reached the 13,000 mark, over 5000 having enrolled in the past year. Our great growth obliges us to erect buildings to accommodate our instructors and facilitate their work. These buildings, which will cost us $100,000, are now under way."

Obituary.

A. U. RUGG, a prominent Plumas Co. miner, was drowned at the middle fork of the Feather river, near Cleghorn bar, last Saturday.

CALIFORNIA MINES AND MINERS.*

Rooms 70 and 71.....San Francisco, Cal.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
HARVEY & HUTCHINSON,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

Saville, MacLymont & Co.,
MINING and CONSULTING
Engineers and Metallurgists.
Examine and report on mines, ore bodies, and all metallurgical processes connected therewith.
Practical mill tests, assays and analyses of ores and general analytical work undertaken at the
CALIFORNIA METALLURGICAL WORKS,
10 Annie St., (opposite Palace Hotel),
Between Market and Mission Sts.,
SAN FRANCISCO, CAL.
References to leading mining men on application.

CHARLES P. GRIMWOOD,
Mining Engineer and Metallurgist,
Laboratory, 214 Pine St., San Francisco.

J. B. TOMLINSON, M. E.
PRESCOTT, ARIZONA.
MINING PROPERTIES EXAMINED, APPRAISED AND REPORTED UPON,
—AND—
Supervision taken of the development of prospects and the operation of mines.

Robert H. Postlethwaite,
Member Institute Electrical Engineers, London.
Carrville . Trinity County....California.
Having been engaged in the designing and construction of river dredgers for gold saving in New Zealand for some years, is prepared to furnish plans and advice.
☞ Correspondence Invited.

Thomas B. Everett, M. E.
Twenty-six years practical experience in metal mining. Will make reports upon property, or furnish properties to purchasers, if desirous to invest in the Cripple Creek gold district, all on short notice.
References furnished in Denver or San Francisco. Branch office, Room 25, tenth floor, Mills Building, San Francisco, care S. K. Thornton, or THOMAS B. EVERETT, Box 195, Denver, Colo. Registered cable, Everett, Denver.

EDWARD C. BROADWELL,
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.
Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.85; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

PROFESSOR GEORGE DAVIDSON,
Late of U. S. Coast and Geodetic Survey.
Consulting Civil and Hydraulic Engineer.
GEORGE F. DAVIDSON,
Agent for Sale of Mines,
530 California Street, San Francisco, Cal.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

W. B. TAYLOR. H. C. WARD.
C. A. LUCKHARDT & CO.,
Nevada Metallurgical Works.
ASSAYING, MILLING AND ANALYSIS OF ORES.
71 & 73 Stevenson St., San Francisco, Cal.

PROF. JAMES MANES,
Mining Engineer, Metallurgist and Broker.
Examines, Locates
Mines & Mineral Lands,
Also Furnishes New and Improved
MACHINERY.

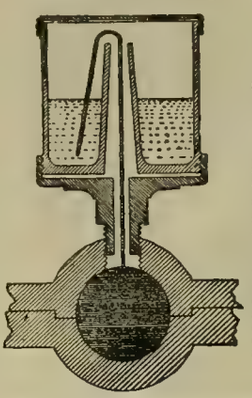
Positively Reduces Oil Bills 75 Per Cent.



THE FINCH OIL CUP.

Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.

During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

K. J. McHUGH, 25 New Montgomery St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

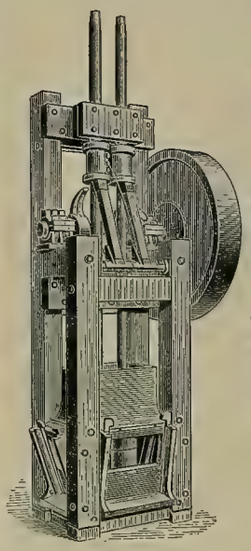
MINING AND MILLING MACHINERY.


"HENDY" IMPROVED
TRIPLE-DISCHARGE
Two Stamp Mills.
Superior to all other Mills of the same form for the following reasons:
First. Because **Two Stamps** will do **More and Better Work** in a mortar than any other number, as the motion of the stamps causes a discharge at the ends of the mortar, in addition to the front discharge, thereby increasing the stamping capacity, and leaving the pulp of uniform fineness.
Second. They are the cheapest mills to the stamp that were ever offered to miners.
Third. They do not slime the ores or flour the quicksilver, as the lateral motion of the pulp prevents such effect.
Fourth. They crush all kinds of ore, rock, cement or conglomerate perfectly.
Fifth. They are more durable, as the framework is secured to the mortar and thoroughly bolted together.
Sixth. The several parts are interchangeable and can be readily set up or taken down and duplicated.
Seventh. No skilled labor is required to assemble the parts.
Eighth. The discharge is larger in quantity to the stamp, and the number of drops per minute, (110) of the stamp is greater than any other mill.
Weight of Stamps (each).....850 pounds.
Weight of Mill complete.....7500 "
Power required to drive.....5 H. P.
CAPACITY, SIX TO TEN TONS PER DAY.
PRICE, $450.00

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

STATE ORE SAMPLING COMPANY, Denver, Colo.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1880 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Mining Summary.

CALIFORNIA.

Amador.

Record: At the Wildman mine, Supt. Ross has had an entire new foundation built under the hoisting machinery at the main shaft. Underground work was continued as usual except the hoisting and extracting of ore, the men entering the mine by way of the Mahoney shaft 1100 feet distant.

At the Central Eureka Supt. Thomas is putting in a four drill air compressor and two No. 6 pumps.

The *Record* hears that the California Exploration Company wants to buy the Gwin mine and that the owners say they will sell for $3,000,000.

Butte.

M. Higgins reports the discovery of a ledge of limestone eighteen miles north of Chico.

The Chinese contractor who has the Big Bend mine leased this year is making extensive preparations for working the mine, says the Oroville *Register*. He has sixty Chinamen at work near the Mosley place on Berry creek, building trails to Berry Creek bar, Bloomer bar and Lattimore bar, to enable him to get his lumber and supplies down to these localities.

J. L. Hicks has been engaged to superintend the Quimby-Jake mine on the Feather river. The company is now sinking a 24x24-foot shaft and will put an engine to work pumping next week. Men are employed sinking the shaft, which the owners are satisfied will locate rich gravel by the time bedrock is reached.

Near Lovelock the Ramsey Bar mine is working eight men and taking out a good deal of gold. Seven men are employed at the Best mine, where a 400-foot bedrock tunnel is being run.

At the Enterprise E. W. Slater is making a connection between the shaft and tunnel in his quartz mine. He has a 10-foot steam arrastra with a crushing capacity of six tons in 24 hours. The Red Point, or New Oregon, mine is one and a half miles east of Enterprise. The owner, Mr. Champion, is running a 150-foot tunnel 140 feet below the works. Nine men are employed. There is no mill or arrastra on the mine. Fred Bachman at the Crystal Hill mine employs four men and has a 4-stamp mill with a capacity of six tons a day.

Calaveras.

Citizen: Work on the Holland tunnel is going ahead. Men have been put to work on the old Union mine, a property that has lain idle for a number of years. Crosscutting has commenced in the Mester mine near North Branch. A new hoist has been erected at the Esperanza mine, and the capacity of the mill increased to 10 stamps, making 30 in all. Work on the Marshall mine progresses nicely. The taking out of gravel will soon commence. The Cassinelli gravel mine on Central Hill has started. Men are at work for the California Exploration Company near Sandy Bar, on the Mokelumne river. A wing dam is being built above the point where the proposed electric plant will be located. Men are grading for the 10-stamp mill to be erected on the Fellowcraft mine. The machinery is already on the ground. The Venus mine at Campo Seco, formerly operated by Casey & Crocker of San Francisco, has been reopened by C. G. Leisinski, a Chicago capitalist. Two working shifts are sinking a shaft. It is the intention to sink 500 feet. A strike is reported in the Thorpe mine, some of the rock assaying as high as $400 per ton. A large mill will soon be erected on the property.

The following is from the Angels *Voice* of July 22nd: Early in February Dr. Jerome Porter of Angels sold the Macau mine at West Point to H. Colburn, Col. J. T. Grayson of New York, Mr. Gillette of Chicago and Mr. Ford of Denver for $80,000; several monthly payments of $500 each were made. During the six months that the company had the property they spent $12,000 in machinery and improvements. Mr. Godbe as expert for the company was to receive a sixth interest for his services.

A large payment was due on the joint bond of the company and the promoter on the 15th of the present month—that is, the time agreed on was the 10th to provide for emergencies, with the 15th as the last day of grace. The 15th came around, but no money from the company. Having learned that Porter had paid $10,000 for the property, they determined to let the bond go by default and then secure the property on their own terms, as they supposed that the middleman would be placed without means to meet the payment due on his bond, and thus secure the property at a saving of about $68,000. But Porter had provided for this emergency by securing other backing, and thus fortified he went to Solinsky, the attorney for the company, and asked how long the time for settlement would remain open. "Eight o'clock," said Solinsky; "we can't stay up till twelve." At five minutes to eight Porter went up to the office, where he found the attorney. When Solinsky told him that nothing had been done, Porter produced the money and secured the property with improvements and machinery to the value of $12,000. He learned subsequently that the company telegraphed to Solinsky the next day to protect the property and the funds would be forthcoming.

Work will be pushed at the Machu, which is now down 130 feet, and drifting will be done as well as sinking.

At the Gwin mine the shaft is down 1300 feet. Sinking will be continued to the 1400-foot level. The daily average amount of water from the shaft is 12,000 gallons.

Del Norte.

Record; Beach mining is still being carried on at Crescent City by Edward Yates. Seven men are employed daily and about 100 tons of sand are washed every eleven hours. The machine used is one invented by Mr. Yates from ideas gained from years of beach mining here and in Curry Co., Oregon. It is claimed to be the best gold-saving machine ever worked on the Crescent City beach. The beach will be worked until such time as the water supply fails. Water for washing the sand is secured by means of a steam pump from ponds in the fields adjacent to the beach. A run of seven weeks has been made on an old back beach without moving the machine.

Work will soon commence at the Coon Mountain Consolidated Gravel Mining Co.'s claims. A letter from Chicago states that contracts have been let calling for the employment of 75 men, work to commence at once. The opening of these claims will call for a considerable amount of money for machinery, labor and transportation from this place before working of pay dirt can be begun.

El Dorado.

(Special Correspondence). — The Amazon mine, eight miles north of Placerville, is being rapidly opened. The shaft has reached a depth of 40 feet and is on a 5-foot ledge of $15 free-milling ore.

The Boulder Mining Company began operations sixteen miles southwest of here on April 10th. Meanwhile they have completed 1500 feet of underground work, 2600 feet of tramway, seven miles of road, eight miles of ditch, offices and boarding house, and a 10-stamp mill ready for operation the 1st of August.

The Newton gravel mine, six miles east, has completed 150 feet of tunnel and crosscut drifts. The 10-stamp mill was started last Monday.

The Lucky Marion, near Greenwood, is drifting on the 100, having run 125 feet, with skip and track in place. Mr. Neir is driving the development work with system and dispatch.

Work on the Larkin is progressing with very satisfactory results in its development. The station on the 250 is completed, and drifts are started on the intermediate levels. The Bostonians and San Francisco people interested in this property are sparing neither money nor energy to develop this mother lode proposition.

The Oakland and Garibaldi mines, near Greenwood, are showing encouraging results in the preliminary work thus far accomplished. The owners, all of San Francisco, are opening an old tunnel that will tap the ledge at 250 feet. The ore body is large and of much merit.

The old St. Lawrence, eight miles north of Placerville, is receiving attention after an abandonment of seventeen years. It was worked with a 20-stamp mill and produced over $600,000 with its crude machinery of the day and with no attention to saving sulphurets. The shaft was 800 feet and there were two winzes, but there was no crosscutting. The old St. Lawrence may yet prove a new surprise as a California mine in its renewed development work.

Placerville, Cal., July 28, '96.

Republican: The Vulture mine on Poverty Point belt, in which the Gentle Annie is located, is yielding some fine specimen rock. It is a white quartz well streaked with gold in bands and nodules. There are two ledges which are being developed, one containing the quartz above noted and the other three feet width of a dark-blue variety which is also considered valuable. The owners are J. W. Dench and W. Craddock, the latter being the superintendent.

Inyo.

Register: The Red Jacket is eight miles south of the Tule canyon placers. The ledge is nearly 3½ feet wide, with a 9-inch pay streak and quartz seams in clay giving $20 assays. The ledge is red and brown oxidized porous quartz, and the pay streak is on the foot wall. The country rock is syenite, the ledge having clay slip walls. When the owners wish to get out a few dollars they can easily get it by putting down a canvas, taking down loose pay ground and running it through a dry washer. At present they have about twenty-five tons of $40 rock and an equal amount of $20 ore. The nearest water is a 70-foot well two miles distant, the quantity being sufficient for milling but not enough for any power except steam. Wood is abundant and there are good roads to mine and water. It is about five miles to Cottonwood creek. A horse arrastra has been built.

P. Keyser lately shipped 4400 pounds of silver rock from his mine in Alida valley to Selby & Co., and received in return, after paying all expenses, $3412. Silver glance and native silver constituted the ore.

Nevada.

The Grass Valley Miners' Union has elected Noah James, president; F. R. Bawden, vice-president; E. F. Whiting, recording secretary; W. H. Bawden, treasurer.

Union: The 40-stamp mill at the Providence mine is to be overhauled and repaired. About thirty men have been temporarily laid off.

The Red Dog Mining Co. has its machinery erected and has commenced the work of sinking a shaft to strike the gravel channel. The mine is situated in Missouri canyon, near Red Dog. The shaft is now down about 35 feet and it is expected that at a depth of 200 feet the channel will be encountered. Some fine gravel has been taken through the lower tunnel.

Plumas.

National-Bulletin: The Harrison mine, Coquette creek, Granite Basin mining district, will soon begin running a tunnel to develop the ledge at greater depth. It is expected to drive this tunnel 600 feet, which will tap the ore body from 300 to 400 feet below the present workings.

See & Jolly have developed a rich body of ore. They are running a small mill night and day.

San Diego.

(Special Correspondence).—A half interest has been sold in the N. G. mine, Rice mining district, Warner's Ranch, to Captain Farnsworth and Perry Bevington, both of Escondido. The main shaft is down 122 feet; two drives, one at the 30-foot level and the other from 85-foot level, run 15 feet into a chute of honeycombed quartz. The chute is perpendicular.

The N. G. is the only mine in which a force of men are at work in the Rice district. At Chewawa, twelve miles north of the Rice mining district, some good ledges have been found by the Rice brothers. One in particular the surface rock goes by assay $126. This ledge is 15 feet wide—good live quartz of a honeycombed nature, impregnated with iron. There is plenty of wood and water. There is a little surface gold found in places. Bill Rice took out $35 worth in less than a week in a small creek which is close to the big ledge.

July 25, '96.

The Golden Cross Mining Company's group of thirty claims is at Hedges, Ogilby Mining District, five miles north of Ogilby station, on the S. P. R. R., eighteen miles west of Yuma, Arizona. There are a number of quartz ledges. The strike is N. E. to S. W. and dip south-east. The country rock is granite, gneiss and hornblende schist. The ores are gold and free milling. A little silver occurs. Much of the ore is copper stained, some stained with iron oxide. These do not affect amalgamation. The company has done most of its development on three mines, the Golden Queen, Golden Cross and Golden Crown.

The Golden Queen surface croppings show a length along the course of the ledge 700 feet and 150 feet wide. Work was commenced in the first croppings, an incline shaft at an angle of 30° is down 650 feet with ore in the bottom. The working levels in this mine are at 100, 150, 200, 300, 400 and 500. The great mass of ore is low grade. The 100 is worked out except pillars that support the roof of mine. The 150 is only partly worked out, ore is being taken from that level at this time. All this ore will average $10 to $15. A 4-foot streak of white quartz, splotched with copper and iron stain, nearly 100 feet long, in this working averages from $10 to $200 per ton. On July 1st, '96 there was estimated 6000 tons of ore on this level. The 200-foot level contains a stope 200 feet by 150 feet and 54 feet high. The 150 and 200 are timbered with square sets. There is some good ore yet in 200, probably 4000 tons. The lateral development on these workings is about 200 feet. The 300-foot level is a stope 160 by 80 feet, 54 feet high, with a wing 30x100, 54 feet high and a wing 60x40, 30 feet high. There is yet probably 12,000 tons of ore in this stope which will average $10. The 400-foot level is a stope 180 feet by 60 feet and 54 feet high, east wing 80x60x30. The vein or ore body in the 400 becomes more concentrated, cleaner and a more even grade than any ore in the upper workings; there is yet some 10,000 tons in this stope. The ore from this working graded up all the ore milled for seven months to a battery assay of $9.75 average. The 500-foot level is the continuation of the same ore body and is practically the same ore as the 400. This level is opened up and beginning to furnish ore. The indications are that the ore in the botton of inclined shaft is the ore from the second or southerly surface cropping; the ore from the 400 and 500 should be found farther east on the 650-foot level. If this is the case there will be two veins or ore bodies to work on at this level. The gold from this mine grades high, varying from above 800 fine to 940 fine, and has yielded at mint from above $18 to $19 per ounce.

The General Miles mine, joins the Golden Cross on the south line; the ore of these two mines being the same, and the two claims side by side being necessary to cover the area of the deposit. The Golden Cross is developed on the 200-foot level only, 200 feet by inclined shaft 45° pitch. The stope is 185 feet long, 135 wide, and 100 high. A winze from floor of 200 is now down 45 feet, and shows higher grade ore than anything above it, assays from $8 to $15. The incline shaft is down 75 feet below the 200, and the 300-foot level will soon be opened up. The ore in the 200-foot stope is low grade, running from $3 to $5, with rich streaks running through it. The waste and very low grade rock is left in the setts, and the entire mass sent to mill runs from $3 to $5, occasional richer strata grade it higher. The 300-foot level will show a much better average. The company considers there is ore here for a 100-stamp mill for twenty years.

The Golden Crown mine is similar to the others, has the same general character of ore and grade is higher than Golden Cross. It has three working levels, 100, 200, and 300 feet, the best ore is at the 300, though there are rich streaks in both the other workings. The output averages from $5 to $8.50 battery assay. The incline shaft at an angle of about 40° will soon be sent down another 100 feet. Indications all point to the conclusion that the three ore chutes in this mine will unite at the 400 or 500 foot level. All the levels are timbered with square setts. The General Miles, the Talmadge, the Danube, the Beecher and the Ingersoll are not yet fully developed, although considerable work has been done on all of them.

The camp is a horseshoe canyon, and the several mines surround it and cover the ground of the canyon as well. The claims or locations all join end and end, and several of them lap; the ground is entirely covered.

The company has a 40 stamp mill, 850-pound stamps, all in running order, 20 stamps of which were started up September, 1893, and the other 20 were started March, 1894. The 100-stamp mill was finished November, 1895, 1000-pound stamps, and complete in every particular. The machinery consists of one double cross compound Corliss engine, capable of developing 350-horse power, an air compressor, electric light and power plant, four boilers, four hoisting works complete and rock crusher. The company pumps water from the Colorado river, and has two pumping plants, each capable of furnishing 300,000 gallons water per day, and a twelve-mile, six-inch pipe line. The company also has two reservoirs—one for each mill and large enough for domestic supply also. The company's store and boarding house both do a good business and show good profits. The operating expenses run from $500 to $600 per day, and the minimum amount of monthly cleanup will not fall short of $40,000. The camp has a population of some 450 people.

Following is the date and result of cleanups for the year ending June 18, '96:

Date of Cleanup.	*Ounces Bullion.*	*Gold.*	*Silver.*	*Net Value.*

Shasta.

C. H. Behrens has sold his mine to Wells and Stevens. The *Courier* says they will take their ore to Keswick.

Courier: The laborers on the Muletown and Brandy Creek ditch get 90 cents a day. The ditch is to be 5 feet on top, 2½ feet deep and about 3 feet wide at the bottom. The contract price was $2.50 for pick and shovel ground and $4 for blasting ground per rod. Water will be taken from Brandy creek by means of the old ditch by Bear Trap, turned into Boulder creek, and the new ditch from Muletown will be constructed to tap Boulder above the Paige ranch. The water will give the Baer and Simons company about eight months piping on its gravel claim near Muletown.

Siskiyou.

Journal: The Distlehorst & Barton Dredging Co. will start August 10th.

The Horse Creek mine closed down last week, owing to a break in the ditch.

The owners of the Horse Creek China river claim in their cleanup realized 18 ounces, or about $300. There are large beds of rich gravel all along the Klamath, which will be easily handled by the dredger.

Chamberlain & Timmons think of erecting a mill on Mill creek, near the Mable mine.

The Seattle Placer Mining Co. shows what capital will do when judiciously invested. The old Shinar mine, which they bought through T. J. Nolton, is paying well, and, having built a fine ditch to the mine, they are now in a position to work the mine the year round.

Journal: The Ben Shinar placer mine and a tract of ground below it on the Klamath river, in the Seiad mining district, have been sold to Mr. Simons of Denver, Colo., for $15,000. Three miles of ditch flume will be constructed, taking water from Thompson creek, which will reach the north bank of the river, and the water will be taken across in an 18-inch pipe, suspended on wire cables. This mine is rich in gold—$10 a day to the man was made while prospecting it.

The miners around Oro Fino and other mining camps throughout the county are busy making cleanups, and some of them are doing exceedingly well, most of the hydraulic miners having had an excellent season, as the water held out much better than they expected it would. The quartz miners in every part of the county have done better this year than usual, and a number of new and promising ledges have been discovered. The great difficulty with quartz mining has always been the expense of getting the ore to a mill for crushing, but a number of small mills have been erected during the past year, which have been the means of opening up several good paying ledges.

NEVADA.

HUMBOLDT COUNTY.

C. H. Wilbur, manager of the Golden Eagle mine, tells the *Tribune* that at present the development of the property is confined largely to the main tunnel that has penetrated the hill for a distance of 168 feet, of which distance 102 feet is on the ledge. For the first seventy-five feet the pay streak averaged about fourteen inches. The present face of the tunnel is about 140 feet from the point at which the upraise will be made for connection with the shaft; and that having been accomplished, extraction of ore will be begun.

OREGON.

BAKER COUNTY.

A. Geiser, superintendent Bonanza mine, has bought the Pyx mine for $15,000.

JOSEPHINE COUNTY.

G. F. Wheeler wires from New York that he goes to Grant's Pass. Money has been raised to equip and develop the mines at Waldo and on the Illinois, and this week Supt. Brown expects to have men at work at both places.

JACKSON COUNTY.

The suits involving the Golden Fleece mine near Ashland have been transferred to the U. S. District Court at Portland, on the petition of E. M. Corliss, who claims to own the mine by assignment from M. A. Graham.

The *Journal* hears that Bartlett's copper

ledge on Indian river has been jumped. It was located some years ago by Green Bartlett, who once owned the Bartlett Springs in this State. He claims that he has performed the annual assessment work on his copper ledge and that it is not jumpable.

LANE COUNTY.

In the Bohemia mines the road is completed to the mill site of the Noonday Mining Company's mine. I. B. Hammond has the contract for furnishing and constructing the mill, three-fourths of a mile from the Annie mine. It will be in operation September 1st. Work is being pushed in the lower tunnel of the mine to tap the vein. Three eight-hour shifts a day are being worked. The tunnel is now in 440 feet. The Music company has its mine and mill in operation and running steadily.

UNION COUNTY.

The Union-Companion mines in Cornucopia have passed into the hands of W. J. Clark, of Montana, and John E. Searles, of New York. The payments, extending over a period of eighteen months, were made in installments of $10,000 every sixty days, and were promptly made when due. The final payment was made on the 19th ult., and the deeds forwarded to Union for record.

WASHINGTON.

Edward Blewett, of the Blewett mine in the Peshastin, near Ellensburg, Kittitas Co., says in twelve days recently he ran through the 20-stamp mill 532 tons of ore and cleaned the plates with a result of $8000, besides the concentrates, and the concentrates will run half that amount.

F. R. Pendleton of Occuda, Wis., is at Snohomish representing the O. & B. Mining and Milling Company; capital, $500,000. They have leased the O. & B. mine in Monte Cristo district and bonded it for $40,000. The company is said to be amply backed by capital.

BRITISH COLUMBIA.

CARIBOO.

Record: The region about Quesnelle will this summer present a scene of extraordinary activity in gravel mining. The six principal dredging companies, owning leases on the Fraser and Quesnelle rivers, are satisfied of the richness of their claims, and are backing their opinions with a free expenditure of money for machinery and supplies, while many smaller concerns and individual miners will be at work drifting and sluicing on the benches and bars.

IDAHO.

On More creek, near Boise, Poston & Reuben have a dredging machine, which works on the principle of a steam shovel, but, instead of a shovel, grapplers are used. When the grappler is spread out it is 6 feet 1 inch long. The grapplers close when they are driven into the ground and lift up all the gravel over 3 inches in diameter. The rock is washed and tossed aside. The small gravel and sand are raised with a pump. They can get a pressure with their force pump of 100 pounds per square inch. Their boiler is 80-horse power and the engine 72-horse. The company will put in a flume 3x2 feet. The cost of operating the machine per day of ten hours will be about $50.

UTAH.

In the report of the Ontario Mining Co. for the year 1895 Superintendent R. C. Chambers says: "All the levels running east from No. 1 shaft, and all running west as far as No. 3 shaft, are practically exhausted and abandoned, and the pumps and machinery have been removed from the shaft. The 700, 800 and 900 levels of No. 2 shaft are exhausted as far as they run east—that is, to the great east faulting fissure—and also west as far as No. 3 shaft. The 1100 level was extended 250 feet, but nothing of importance was discovered. The 1000 and 1200 levels are to be more thoroughly prospected before being abandoned. The 1300 level has been driven west 360 feet. The work on the 1500 level has principally been stoping, and the yield has been good. No. 3 shaft was sunk 150 feet during the year. The stopes above No. 0 level have been very productive, and it will take some time to work out this part of the mine. The stopes on the 100, 200 and 300 levels cannot be depended on for a large amount of ore. The 400, 500 and 600 levels yielded fairly well and nothing was done on the 700. There is some good ground still to be prospected on the 800. The 900 level was run west 1600 feet and some good ground opened up. The 1000 level was run west 1430 feet and the stopes promise to yield well. The greater quantity of ore from shaft No. 3 was taken from the 600 level and toward the surface." The superintendent estimates that it will take two or three years to work out the upper levels above the old drain tunnel, and they should produce a large amount of ore. "From shaft No. 3 west to the Daly line," he says, "we have 500 feet of backs from the 1500 level up to the 1000 level, this being virgin ground which yet remains unprospected, and should produce ore enough to run the mill for some years to come." The drain tunnel was extended west 2135 feet and a drift run north to connect with shaft No. 3. This will be continued to and through the Daly ground. The volume of water running out of the tunnel is 20 inches deep by 5 feet wide, and the flow is 8100 gallons per minute. This water operates an electric light plant, consisting of two generators and four motors, 75 H. P., furnishing 800 lights for the mills and mines and power for the Ontario and Daly machine shops and sawmills. During the year the mill treated 30,250 net tons of ore, of an average assay of 45.48 ounces per ton, saving 92.2 per cent, and producing 1,276,547.88 fine ounces of silver and 951.80 fine ounces of gold. The milling cost was $6.30 per ton and the total operating expense was $22.53 per ton. Compared with 1894 there was an increased tonnage, lower values, higher percentage saved and less cost for production and operating expenses. The cost of extraction, however, showed an increase of 38 cents, owing to the fact that the ore was taken from the upper levels, out of small and narrow seams of low-grade ore that had been passed over in previous years. The bullion product for the year sold for $849,851 and the ore sales aggregated $47,297, the total net proceeds of ore and bullion sales being $855,722. The operating expenses were $685,672, and the cash balance was increased from $267,296 to $462,638, and $84,941 was expended on the electric light plant and water supply. The net cost of the drain tunnel to January 1st was $544,409, and the statement of mine and mill improvements shows a total expenditure of $1,766,185. The total value of all assets is given at $2,337,609, and at the date of the report the company had paid $13,175,000 in dividends. The mine has produced 507,481 tons of ore, containing 31,-903,441 ounces of silver, which sold for $30,211,657.

The old mill that was put up eight years ago by the Lead Mines Company of Bingham for the treatment of ores from the Brooklyn and other claims belonging to it was burned last week. The *Tribune* estimates the loss at over $20,000, with insurance about one-third of that sum.

No better or more eccentric evidence of the auriferous riches that prevail in Little Cottonwood has been seen, says the *Tribune*, than that which was brought in from the property of the Dipper Mining Company. The ore is, perhaps, a departure from anything that has been found in Utah. It consists of a lava-looking material, upon the face of which is seen gold in very pronounced quantity and which will return, perhaps, several thousand dollars a ton. This makes its appearance in a small seam beneath the main ore body, which consists of a decomposed quartz containing free gold. A portion of it has been oxidized, giving it a ferruginous appearance, while upon the face are copper stains.

MONTANA.

The Blackfoot reservation is about to be thrown open and occasions considerable interest thereabouts. The patrol force of the Government has been doubled and the strictest guard is kept against all "sooners." The United States surveying party has commenced work, which will occupy its attention until September 15th. The strip of land is 15 to 20 miles wide and about 60 miles long, and is known to contain rich mineral. Copper and gold predominate. The copper ledges have been known to exist there by old prospectors for many years, but not until last fall could the Indians be prevailed upon to sell it. The amount paid by the Government was $1,500,-000. Years ago prospectors were in that country looking for gold, but quartz mines were overlooked in the search for placer. In those days that country was infested with hostile Indians and many a prospector was lost in oblivion while prosecuting his search through the Blackfoot up into the British possessions. At that time the route was up through the Yellowhead pass into British Columbia. Since then placer mining on the banks of the Saskatchawan has become almost a thing of the past and quartz rock has been discovered in abundant quantities in the Blackfoot.

The Helena & Livingston Mining Co. has mines at Alta and mills at Corbin. Manager O. R. Allen has a dump of tailings estimated to average $6 per ton, to crush which Manager Allen is having built a number of barrel pulverizers, in which round iron balls will be placed and the barrel revolved. These will have an end feed and an end discharge. Each of these barrels will be 6x8 feet, and, to test merits of different linings, they will be lined with porcelain, iron and steel. The whole plant will be run by water power generating electricity. The water is ditched and flumed eight miles, crossing two gulches where inverted syphons are used. The power is transmitted about three miles by wire.

The Philipsburg *Mail* learns that the Sunrise property is to be run on a more extended scale than has been the case during the past few months. Ten of the twenty stamps will be run continuously.

The directors of the Iron Mountain mine have decided to run a tunnel to tap the mine at a depth of 1600 feet. The tunnel will be 5600 feet long and work on it will take fully a year. The cost of this piece of work will be about $70,000. It is said that the driving of the tunnel will effect a saving of 33 per cent in the cost of getting ore from the mine. The ore is now taken from a shaft sunk to the 1600-foot level, and the design is for the tunnel to meet the shaft at this point. As the mine is operated at present the ore has to be hoisted up to the top from the 1600 level and then taken around on cars two miles down to the mills. The tunnel will be cut so as to open directly over the mills. The regular monthly dividend of 1 cent a share has been paid for July, which amounts to $5000.

MICHIGAN.

In '95 were produced pounds of refined copper as follows: Atlantic, 4,382,497; Calumet & Hecla, 77,337,922; Central, 379,020; Franklin, 3,086,933; Kearsarge, 1,946,163; Minnesota, 10,585; Osceola, 6,270,373; National, 40,-128; Quincy, 16,304,721; Ridge, 64,363; Tamarack, 14,900,316; Tamarack Junior, 2,547,861; Tributes, sundry, 37,583; Wolvervine, 1,815,-391. Total, 129,573,856. Total dividends paid in '95: Calumet & Hecla, $20 per share, $2,-000,000; Kearsarge, $1 per share, $50,000; Osceola, $2 per share, $100,000; Quincy, $12 per share, $600,000; Tamarack, $8 per share, $400,-000. Total, $3,150,000.

The total amount paid in dividends by the copper mines of Michigan is $68,460,375.

COLORADO.

Mining Industry: The weekly output of base bullion by the smelters of the State forms a tangible basis of what is being done in the mining industry, which, however, does not include the product of the numerous cyanide mills, which turn out most of the gold. The smelters turned out base bullion for the week ending June 27 in the following values: Pennsylvania smelter, $26,361; Germania, $34,000; Hanauer, $17,550; total, $79,-911. Besides this, the Eureka hill bullion amounted to about $100,000; that of Ontario, $16,800; Daly, $15,200; miscellaneous, $3500, making a total bullion output for the week of $213,411.

Republican: Cripple Creek will probably produce more gold this year than it did last, though it is not believed that the output will equal what was predicted at the close of 1895. Then expectation was at high pitch, and it looked as though the district would soon rival Johannesburg in its production of gold. That expectation was disappointing, so far as the first six months of the year are concerned. But there seems to be no reason to question that the remainder of the year will witness a much larger production than the first half, provided the mill erected for the low-grade ores of the Independence is a success.

Under date of July 24th, F. H. Pettingell, talking of the mining stock market, writes from Colorado Springs: "The entire East is peculiarly indifferent to Cripple Creek mining propositions. Here and there we notice a few who look upon them kindly, but only in an endeavor to get in on a ground floor basis at the expense of their friends or by misrepresentations to the mine owner as to their ability to raise capital for development, which, sad to relate, they invariably fail in doing on occasions when cash is necessary to develop a legitimate mining enterprise of unquestioned merit. Nothing but local capital is available. Many times have I seen a mining proposition hawked throughout the East only to return to be taken up by intelligent Colorado mining operators. The ordinary Eastern man scoffs at our mining industry. Our State would be an abandoned desert without it, as it is even amid general financial distrust bordering upon a panic. Prosperity smiles on us as in no other State in the Union, and will continue to whether we have free silver or not."

NEW MEXICO.

The Fraser group of gold and copper mines, in the Rio Hondo district, Taos county, has been sold to an English syndicate, represented by T. B. Gillespie, for $100,000 in cash and $35,000 in stock. The purchasers have incorporated the Rio Hondo Copper Mining Co., capital stock $5,000,000, and the Cristobal G. and M. Co., capital stock $2,000,000.

Silver City *Enterprise*: Supt. Curtis of the Arizona and New Mexico Smelting Co. says there is a market for the zinc-lead ores and pyrites-zinc ores of this section, which heretofore have been an unacceptable product at the smelters. The smelting works at Canyon City, Colorado, is now in the market for the purchase of such ores.

The Silver City Reduction Works shipped one car (20 tons) of copper matte Monday and will ship another to-day.

W. H. Newcomb has twelve men employed mining iron ore on Legal Tender hill, almost within the city limits.

The turquoise mines at Azure, twelve miles from Silver City, are employing about twenty men at present, under the superintendency of Felix Vogel. These mines are now the greatest producers of turquoise in the world.

At Pinos Altos forty men are employed at the mine and mill. The mine is keeping up its usual product of rich gold ore, running from an ounce and a half to two ounces per ton.

At Mogollon the Confidence mine has eighty men on the payroll. Development work is being pushed on the 100-foot level below the main adit level. Eighty tons of ore per day is being extracted and sent to the mill at Graham, three miles distant.

At La Belle the Ohio men who bought the Midnight group have formed the Midnight Mining Co. At the Midnight two veins have been opened up in the lower drift—the main one being 7 feet wide—from which mill runs by the MacArthur-Forrest cyanide process gave an average of $17 per ton, and mill runs by the Pelatan-Clerici cyanide-electro process gave $15 per ton, the former saving 92 per cent and the latter 99 per cent of the assay value. H. Finch is superintendent.

ARIZONA.

Miner: The Marie Mining Company has bonded a gold mine in the vicinity of El Dorado canyon, Mohave Co., making a partial payment.

It is reported that another attempt will be made by a French syndicate to work the placer beds of the Colorado river, the proposition being to put in a power plant that will melt the cement through the gravel like so much drift sand.

M. D. Lattin and G. Defrance have brought in $500 from the Chemehuevis placer fields. It was taken out by dry washer process during the month of June. Owing to the intense heat, they were unable to work only in the morning and evening. Mr. Defrance says that a great deal of the gravel in their gulch will run $1.50 the pan; that from six 75-pound hoppers that realized $47.60. Wells are now being sunk with fair prospects of getting water. About forty men are now in the district and all are making money. Gold is found the entire length of the range and in the detached foothills.

In the Trench mine at Harshaw, Richard Farrell employs ninety men in the mine and nine in the reduction works. The capacity of the mill is seventy-five tons daily. The ore is rich in silver and lead. The Trench has two shafts, one an incline of 500 feet and the other a perpendicular shaft for 100 feet after which it inclines slightly 200 feet farther.

LOWER CALIFORNIA.

Lower Californian: The mill of the La Fortuna Mining and Milling Company commenced operations this week.

It is Better

To pay $100 for Advertising that brings returns than 100 cents for that which brings no returns.

The 43rd Great State Fair of California

WILL BE HELD AT

1896=SACRAMENTO=1896

THREE WEEKS. - - - - - - SEPTEMBER 1st to 19th.

The Soil Products of this great State will be a leading feature.

The Mechanical Display will be as attractive as usual, and made up of live exhibits of machinery and neat designs of goods.

The Live Stock will form a most important division of this season's exhibit; competitive tests will be held among the various dairy and beef breeds of cattle.

The Poultry Exhibit will form one of the most interesting features of the Fair.

The Racing Programme will be of unusual excellence, inviting contests between the highest class of horses.

The Exposition Building will be a blaze of electricity, affording every advantage for the exhibition of all kinds of articles.

Electric Motive Power generated at Folsom, twenty-two miles distant, will turn every wheel and furnish brilliant lights for the entire exhibition. Space, power and light furnished free to all exhibitors.

The Mining Interest will be represented by an exhibit of ores and a series of rock-drilling contests, showing accuracy and dispatch in this kind of work.

Cassasa's Great Exposition Band will give high-class concerts at the Pavilion each evening.

The Manufactures of California can meet the consumer to a better advantage at the State Fair, by reason of its varied attractions, than at any other public gathering in the State. Exhibit your goods and let the people know what is made at home.

Free transportation for exhibits and reduced rates of fare will be given on all railroads. Address the Secretary for information of any character. Premium lists now ready.

EDWIN F. SMITH, Secretary. C. M. CHASE, President.

Coast Industrial Notes.

—The Yuma, Arizona, custom house has been discontinued.

—Southern California has sold 3,000,000 pampas plumes for campaign purposes.

—Recent intensely hot weather has killed the southern California orange scale.

—The Sierra Valleys Railway Company is now running its cars regularly to Claireville, thirty miles east of Quincy.

—For the year ending June 30th the money order department of the San Francisco postoffice received and paid out nearly $6,000,000.

—The Great Northern Railroad Company has given a contract to M. Dow for the erection of a new freight depot at Seattle, Wash., 506x45 feet.

—The Northern Pacific Coal Co. have just completed the loading and shipping of 2500 tons of coal from Roslyn, Wash., destined to San Francisco—the first shipment of the kind.

—Seattle, Wash., is about to build new water works. R. O. Thompson is city engineer. The MINING AND SCIENTIFIC PRESS of January 11, '96, has a full description of the proposed work.

—The annual prophecy of a short pack of salmon on the Columbia is issued. The aggregate at the close of the season will probably not be far from the usual half million cases of 48 one-pound tins.

—All the machinery has been taken out of the Oconta, Wash., mill and shipped to Cosmopolis. Over $75,000 has been lost in attempting to operate the mill there on a poor site with bad management.

—A "labor" journal here is set on a typesetting machine. The MINING AND SCIENTIFIC PRESS is one of the few papers in this city that employs men to set the type for the paper, machines having in most cases taken their place.

—The machinery in the old Pioneer Woolen Mills at North Beach, this city, was bought by Japanese, who will set it up in Japan to make woolen cloth. Still, there are probably coast wool growers who will vote a free trade ticket again.

—American manufacturers and merchants doing business in Mexico are notified of the abolition of the interstate duties in that country. It is expected that the inauguration of the new system will be followed by an increase in the shipments of American goods to various parts of Mexico.

—The close margin now existing in the way of corporate profits is exemplified by the annual report of the San Francisco and North Pacific Coast Railway, which, under good management and comparatively fair business, was only able to show a profit of .26 of 1 per cent on the capital stock for the year ending June 30, '95. A mine superintendent that couldn't make a better showing than that would be in danger of being "fired."

—The Placerville *Democrat* states that a surveying party from Folsom have left Placerville for the Summit, with work before them for the summer. In the interest of the Natoma Water Company and the American River Land & Lumber Company, the party is to locate sites for storage reservoirs and to make accurate surveys of lakes and their outlets, of streams and all sources of water supply for lumbering, transportation, milling and mining purposes.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 21, 1896.

564,331.—FRUIT DIPPER, ETC.—F. Kimble, Los Angeles, Cal.
564,251.—PIPE PATCH—T. F. Long, Garvanza, Cal.
564,452.—KEY FASTENER—F. Reisner, Eugene, Or.
564,336.—BUGGY TOP ADJUSTER—J. G. Ritz, Newberg, Or.
564,314.—ANNUNCIATOR—J. B. Rogers, Zillah, Wash.
564,341.—HYDROCARON—F. Salanthe, Santa Paula.
564,580.—PAPER FILE—A. J. Thompson, S. F. Cal.
564,349.—LAWN SPRINKLER—J. P. Van Sickle, Pasadena, Cal.
564,463.—CUSPIDOR—Wolf, Johnson and Wallace, Winslow, Ariz.
35,797.—DESIGN FOR CURTAIN RING—W. P. Bower, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Fourth on the List.

In the last volume of the MINING AND SCIENTIFIC PRESS, the twenty-six numbers from January to June of this year, inclusive, the mines of Siskiyou county received thirty-two notices, varying in length from six lines to a column. Amador and Nevada counties each received thirty-eight and Calaveras forty-three. This puts Siskiyou county fourth on the list—the same position in which we appear as a gold producer.—Yreka Journal, July 28th.

Personal.

WM. WILLOUGHBY has returned to Grass Valley from South Africa.

JOHN TRUSCOTT is the new superintendent of the Oneida mine, Amador Co.

SUPT. HANSBOROUGH of the Rising Sun mine, Sierra City, Cal., will shortly resume work.

THOS. OXAM has assumed general management of the Jim Crow and Monitor mines, De Lamar, Nev.

E. H. AIRIS succeeds Col. J. W. Donnellan in the presidency of the Salt Lake, Utah, Mining Exchange.

THE Boston and Montana officials deny the Eastern report that Capt. Couch had resigned as general manager.

JAS. SHIRLEY has taken charge of the Yum Yum and Annie mines at Big Bug, Arizona, and will build a new mill.

E. K. STEVENOT, M. E., has gone to Calaveras and El Dorado counties to examine and report on some mining properties.

CHAS. D. LANE, the wealthy California miner, paid all the indebtedness of the Bimetallic National Committee at St. Louis.

E. B. PRESTON, of the State Mining Bureau, is in Nevada Co. W. H. Storms, who recently returned from Placer Co., goes to Calaveras.

"BARBARIAN" BROWN, of the Cœur d'Alenes, has returned from South Africa, where he took part in the recent political troubles.

JOS. T. GOODMAN, well known to many old Nevadans, has built a house at Mariposa, where he is finishing his book on Central American hieroglyphics.

W. E. SUTTON has been appointed superintendent of the mines at Monte Cristo, Wash. Mr. Sutton was for several years chief engineer of the Mollie Gibson mine at Aspen, Colorado.

ENGINEER GRIFFITHS of the S. P. Co. goes to Guatemala to superintend the construction of forty miles extension of the Occidental Railroad from Champerico on the Guatemalan coast to San Felipe, as far as Mazaltenango. The mountainous character of the country will make the work cost nearly $3,000,000.

R. L. DUNN left last Wednesday for Siberia, via Paris, to examine and report on a placer mining undertaking on the Amoor river. He contemplates an absence of four months. It is understood that Mr. Dunn receives one of the largest fees ever paid an American mining engineer for similar services.

Recent California Mining Incorporations.

Blaine G. M. Co., by E. N. Linsay, E. B. Young, A. D. Bowley, C. Ospin, J. Moore, San Francisco; capital stock, $200,000—$13,231 paid up.

Hartman M. Co., by J. H. Wallace, H. J. Small, H. L. Stevenson, G. W. Peer, J. Musgrove, San Francisco; capital stock, $60,000—$26,500 paid up.

Victoria G. M. Co.; capital stock, $500,000; E. S. Smith holds $499,900 worth of stock, W. A. McNaughton, E. W. Huford, M. T. Dusinbury, W. R. Thomas, Oakland.

Recently Declared Mining Dividends.

THE Boston & Montana Co. will pay a $3 dividend on the 20th inst.

Eastern Office: No. 284 Pearl Street, New York

TO MINE OWNERS AND SUPERINTENDENTS.

Gentlemen:

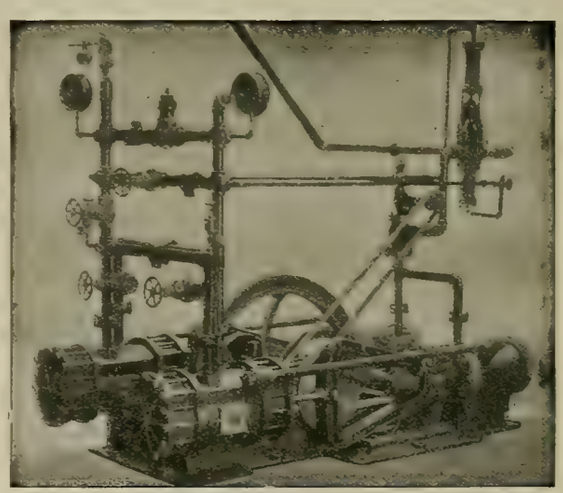
We desire to express to you our appreciation of the 12 H.P. Power Gasoline Hoist, purchased by us for our works at Silver City, Utah. The same is working satisfactorily to our Board of Directors. We have never yet used in any one day, five gallons of gasoline ~~for~~ to do our hoisting, although we are running two shifts of men, one at night and one in the day, using the engine during the day only. We are satisfied that in a dry country, or in one where fuel must be transported any considerable distance, that the gasoline hoist is the proper one to purchase; for that matter, we may say, even where water and fuel is plenty, after a thorough test of the Hercules Gasoline Engine, we would not consent to the erection of any other plant, as it costs less than three-fourths of a cent per ton hoisting one hundred and sixty-five feet high. We therefore take pleasure in recommending the Hercules Gasoline Engine as being the most complete and successful hoisting engine of that kind in the market.

Very respectfully,
Fond Aces Mining Company
By Brant & Booth
President.
By. J. R. Slater
Secretary.

Fac simile of letter to

HERCULES GAS ENGINE CO., builders of Gas, Gasoline and Crude Oil Engines, from 1 to 200-horse power. Hoisting, Pumping, Stationary and Marine. Office, 405 and 407 Sansome Street, San Francisco, Cal.

DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

LIMITED.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

The Kendall system is covered by patents which this company will defend.

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

Owners of mines and reduction works can obtain full information on application to

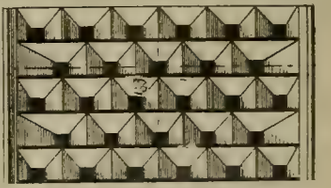
PAYNE'S

PATENTED

GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

1710 Champa Street, DENVER, COLORADO.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

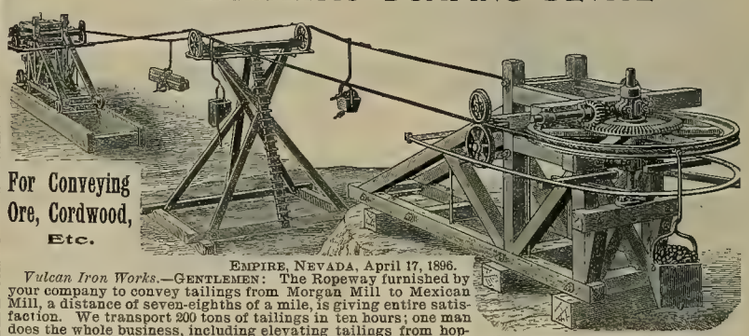
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

THE POOR MAN'S MILL AND ENGINE:

THE . . . . . DANIEL BEST CRUDE OIL . . ENGINE. . . . .

CAPACITY, 2 to 200 HORSE POWER.

The Cheapest Power Known;

Invaluable Where Fuel is Scarce.

The most economical motive power ever invented, costing but 10 cents per H P. per ten hours' run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

THE KINKEAD QUARTZ MILL.

The Kinkead Quartz Mill will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine, to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

Price of Mill $1,000, f. o. b. San Francisco, including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole Mill. This Mill can be made in 300 lb. sections, if desired, at extra cost. Send for Catalogue.

Interior of Four Kinkead Quartz Mill Plant at Virginia City, Nevada, Equal to Twenty Stamps, Crushing Fifty Tons Quartz Daily Average.

Call and See Our Kinkead Quartz Mill in Operation. * * * 413 & 415 MARKET STREET, San Francisco, Cal.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. **CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE.** FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

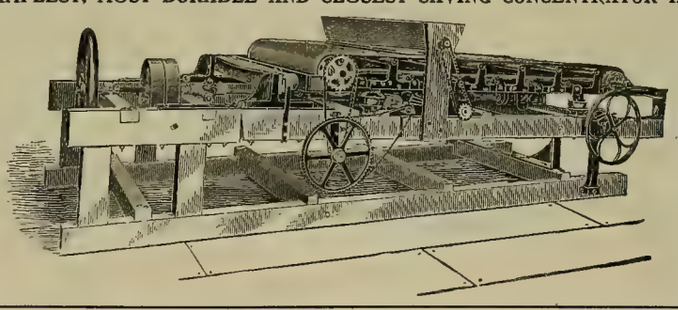
NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

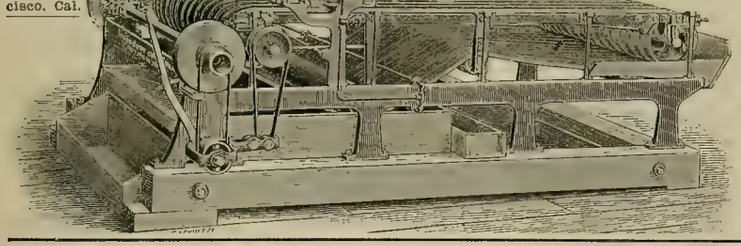
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

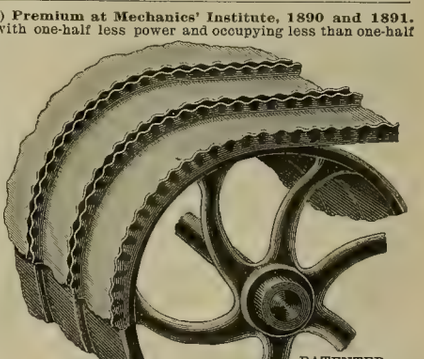
was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

Market Reports.

The Markets.

SAN FRANCISCO, July 30, 1896.

General trade continues good for the season of the year. The buying, as a rule, seems to be confined to as small quantities as possible, but ordering is oftener so as to keep up assortments. It is stated by returning traveling salesmen that the feeling throughout the coast is more hopeful, and where two years ago pessimists were in the majority they now find the optimists in the majority. Even in agricultural districts this feeling has changed for the better. Prices for grain, fruits and other farm products average higher than at this time last year, while inland transportation charges average less. Taking the price of wheat alone, and the advance over that ruling a year ago makes a difference in favor of the farmer of fully $1,000,000, while the present outlook points to still better figures before the end of November. This is an important factor with the trade and one which will make itself favorably felt later on. In the lumbering camps there is continued activity, while in the mining districts there was never before such activity. It is estimated that there are fully 30,000 more men engaged in mining, prospecting, etc., than two years ago, and still the number steadily increases. This naturally makes more business with foundrymen, machinemen and others engaged in ironworking. The improved prospects for cereals will naturally have a favorable effect on farm implements, and therefore it is only reasonable to assert that the coming winter and next spring agricultural implement makers will have a large increase in orders, which will call for more help and a freer distribution of money.

In the local money market there is nothing new to report. So far as can be learned, the silver agitation has had no unfavorable effect, and none is looked for by persons outside of chronic croakers who invariably see financial crises ahead. The disbursements made this month for dividends, interest and regular semi-annual and annual settlements are going into circulation again. The inquiry for funds is light from both legitimate and speculative sources.

New York Silver Prices.

NEW YORK, July 30.—Following are the closing prices for the week:

	Silver in—

Monday	11 00	2 90	10 25@12 50	13 40
Tuesday	11 00	2 85	10 25@12 50	13 40
Wednesday	11 00	2 85	10 25@12 50	13 40

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	.5
New York Telegraphic Transfer	7½
London Bankers' 60 days	$4.88
London Merchants	$4.86½
London Sight Bankers	$4.89¾
Refined Silver, per oz., 1000 fine	68⅝
Mexican Dollars	54@55c

SILVER.—The market has been quiet, both on this coast and at the East, for export, but there has been more buying for speculation, which keeps prices fairly steady. The speculative buying seems to be founded on the belief that, under silver agitation, prices will advance by reason of large producers not offering freely, and with light obtainable supplies the usual foreign demand will send prices up. So far as we are able to learn, the outturn of silver in this country this year will not be more than from 5 to 10 per cent more than that of 1895. In this city quite a number of persons have bought silver in quantities varying from 5000 ounces up.

Recent silver shipments from New York were as follows:

S. S. Campania, July 18, 620,000 ozs.

(J. & W. Seligman & Co. 250,000, Handy & Harman 125,000, Zimmermann & Forshay 125,000 and M. Guggenheim's Sons 120,000 ounces.)

S. S. St. Paul, July 22, 320,000 ozs.

(J. &W. Seligman & Co. 155,000, M. Guggenheim's Sons 115,000 and Fuller & Wilson 50,000 ounces.)

S. S. Fuerst Bismarck, July 23, 125,000 ozs.

(Handy & Harman 50,000, Zimmermann & Forshay 50,000, Muller, Schall & Co. 25,000 ounces.)

S. S. Fuerst Bismarck, July 23, $2,000,000.

(Kuhn, Loeb & Co. $500,000 bars, Heidelback, Ickelheimer & Co. $250,000 bars, Von Hoffmann & Co. $500,000 coin, Kuhn, Loeb & Co. $250,000 gold coin and Lazard Freres $500,000.)

S. S. Trave, July 21, 155,000 ozs.

(Zimmermann & Frosbay 75,000, Handy & Harman 55,000 and Muller, Schall & Co. 25,000 ounces.

MEXICAN DOLLARS.—There is very little doing in an export way. The light call is, so far, a disappointment.

COPPER.—The market is weak at the East under moderate demand. While the market is easy, yet it is said that considerable confidence is expressed in future values. This feeling is founded on confirmed advices that the consumption abroad is still on a large scale, which makes a steady inroad into stocks, notwithstanding the free shipments. The production in this country under improved methods of mining and reduction shows quite a gain over two years ago.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The call for shipment to the west coast of Mexico does not show any falling off; from other points the demand is light to fair.

The market is quoted as follows:

Home trade, per flask	37 00
Distant points up north	36 25@37 00
West coast of Mexico, for export	34 50

ANTIMONY.—The demand is slow, with the market easy at 7¾@8⅛c in a jobbing way. New York mail advices quote 7¾@7⅞c for Cookson's, 6¾c for Hallett's and 6½c for Japanese, from store.

LEAD.—There is nothing new to report. The demand is light. The East reports a weak market, with supplies liberal and demand only fair.

Pig	3 75	@	4 00
Bar	—	@	4 15
Sheet	—	@	5 50
Pipe	—	@	4 75

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The market is essentially unchanged. The demand is light.

Pig, per lb	14⅛c
Plate, I C coke, heavy, per box	$4 25
" " " light, "	4 10

BORAX.—The market is quoted as follows

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	6⅛
Concentrated, "	5⅝

POWDER.—Tere is a continued large demand from the mining districts.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON.—There is a continued free consumption with us. The market is firm at unchanged quotations.

Our market is quoted as follows:

AMERICAN.

Mining Share Market.

SAN FRANCISCO, July 30, 1896.

The market has been fairly active, with Chollar and Potosi the leaders. If signs do not fail it looks very much as if stronger moneyed parties are manipulating. While this seems to be the case, yet, even conceding it to be so, outside operators must not run away with the idea that prices will go right up, for, taking all preceding upmoves as a guide, there have been decided setbacks if not breaks in prices before the market got into shape for proper handling. In view of the way in which manipulation has been done, it should not cause surprise if the leaders, Chollar and Potosi, were badly cut at any time; indeed, in usually well-informed circles, there are reports that lower prices must be looked for before any decided upmove sets in. Whether these reports will prove correct the writer has no way of verifying. So far as the mines are concerned, they are in better condition than the fore part of June, when prices were from 100 to 150 per cent higher than ruled on Call yesterday when Chollar sold at $2.30. Taking the Brunswick lode we find that on the 300-foot level of Chollar, Hale & Norcross, Savage and Gould & Curry the work has been well advanced and that every indication gives encouragement to the belief that more ore will be found than was on the 200-foot level. While active work is under way on the 300-foot level, they will be soon in position to exploit the 400-foot level. In Occidental the work under way is of a very important character. At several points on the Comstock lode the work that is being done deserves close watching, for it points with unerring certainty to much better things than have obtained for many a long month. Yet, to freeze outside holders out of their shares, the market may be manipulated down, assessments put on and everything made to look "rotten" and discouraging. To a certain extent this is being done even now. About seven weeks ago nothing too good could be said of the outlook of the mines on the Comstock and Brunswick lodes; then prices were high and the manipulators wanted buyers; now the mines have only a few friends, while the situation is made to look as bad as possible so as to discourage outsiders and have them sell at the low current prices.

Herman Zadig returned last Tuesday from a trip to the Comstock and Brunswick lodes. He had in his company two mining men who are reported as being convinced that the Brunswick lode will prove to be richer than given credit. Mr. Zadig deserves credit for the untiring interest displayed in trying to build up in the face of strong opposition the mining industry at Virginia City, which would benefit suffering shareholders in the different mines on the Comstock and Brunswick lodes.

News from the Comstock mines begins to grow in interest as work progresses in the different groups. Yet this work can be stopped or turned in a wrong direction any day and outside shareholders be made to suffer. In Alta they are in better formation and ore giving fair assays. Overman, Seg. Belcher and Belcher are raising some ore each week while doing exploiting work. In Crown Point the work is continued on several levels. They ought to be soon in position for extracting ore. On the 1100-foot level some ore is to be extracted for the purpose of testing. It is stated that this will be done by a new process at some other place than Virginia City. Work is to be resumed in Kentuck before long. We are not advised as to the work, if there is any, that is being done in Yellow Jacket. In Confidence they are still raising for air connection. When this is secured, work in that mine and Challenge will be resumed, and more energetically, too. In Con. Imperial the joint Confidence, Challenge and Con. Imperial crossdrift is being pushed ahead. It is in about 625 feet and should be near the west lode. Work is also continued in crossdrift No. 2 in the same mine. In Alpha they are still at work on the 500-foot level. Work is continued on the long west crossdrift in Bullion. In Potosi and Challenge they are working on the same levels heretofore reported. Over 100 tons of $23-ore was raised last week by Chollar. The work in both Savage and Hale & Norcross is being closely watched. It is on the levels heretofore reported. The joint east crossdrift of Gould & Curry and Best & Belcher is being driven ahead. In Con. Virginia the work is practically unchanged. When the south drift on the 1650-foot level reaches the Best & Belcher line, that level will be exploited. They raised over 130 tons of ore the past week, which assayed over $50 a ton. The company is paying expenses. On the 1000-foot level the formation is favorable, but the ore encountered is more or less barren. The work in Ophir, Mexican, Union, Sierra Nevada, Utah and Andes is on the same levels heretofore reported, with no particular change to note.

The Brunswick lode continues the attraction. Every mining man that has visited it and given the work done close personal inspection is outspoken in the belief that a large body of ore will yet be found, while the ore already found will pay to extract and mill after the lode is better developed. These opinions make men who do not gamble for small things hold their shares of the mines located there for something big or else for a small loss to them. In Occidental work has been commenced in sinking a winze from the 750-foot level, while exploiting work is continued on the other levels. There is a report of an improvement in the mine. In Chollar they will start two or three crosscuts on the 300-foot level sometime in next week. It ought not to take more than three days after starting the work before the downward continuation of the ore found above is struck. This, it is believed, will give new life to the lode. In Hale & Norcross they are pushing work on the 300-foot level while sinking the winze to the 400-foot level. When this depth, which will be in about ten days, is secured that level will be exploited. In Gould & Curry the work is being closely watched and good results confidently predicted by mining men.

The market opened this morning fairly active at an advance of from 10 to 25 per cent over last night's closing. The upmove was due to reports of an improvement in the Chollar 300-foot south drift. At the higher prices some of the short sellers are said to have filled. The general public seem to be feverish and afraid to operate owing to their being skeptical of any stability to the market. It is said that there was considerable realizing at the advance. It is stated that the improvement in Occidental was in the 750-foot south drift. The market was lower at the 2.30 P. M. session. Confidence has been assessed 30 cents a share.

The following illustrates the changes of the week:

Mines.	July 23.	July 30.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

The Jno. G. Morgan Brokerage Company,

BANKERS and BROKERS,

1015 Seventeenth St., Cooper Blk.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

THE SANTA ROSA GOLD MINING COMPANY.

Properties located in the Cripple Creek Gold Mining District.

We believe we can give you the largest prospective value for the least money.

Investigate carefully; hesitate before buying other stocks; consider SANTA ROSA and know why you don't want it.

Call, write or telegraph to F. H. PETTINGELL, 10-11 Bank Block, Colorado Springs, Colo.

Amalgamator, Assayer and Bookkeeper

Desires position at mine. Several years practical experience. Good references. Address

J. R. SEARS, Stockton, Cal.

REMOVAL NOTICE!

We take pleasure in notifying our friends and patrons that upon AUGUST 15th we shall remove from our present quarters to

409 MARKET STREET, Between Fremont and First,

Where, on account of our more central location and more commodious quarters, we shall be better able to look after the interests of our customers.
We thank you for your past favors and solicit your future patronage.

CALIFORNIA ELECTRICAL WORKS,
F. A. GREENWOOD, Secretary.
Remember the New Address—409 MARKET STREET, After August 15th.

Westinghouse Electric and Manufacturing Company,
PITTSBURG, PA.

The Most Modern Mining Equipment
—Is the—
Tesla Polyphase Alternating System of Electrical Transmission.

Current for MINING LOCOMOTIVES, INCANDESCENT LIGHTS, ARC LIGHTS and POWER supplied from THE SAME CIRCUITS.

Address, CALIFORNIA ELECTRICAL WORKS,
35 Market St , San Francisco, Cal.

Assessment Notices.

BEST AND BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of July, 1896, an assessment (No. 60) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 33, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of August, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 27th day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
M. JAFFE, Secretary.
Office—Room No. 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
SAM W. CHEYNEY, Secretary.
Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of July, 1896, an assessment (No. 4) of Two cents (2c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of August, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 21st day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
E. C. GODFREY, Secretary.
Office, Room 38, Crocker Building, San Francisco, alifornia.

CONSOLIDATED IMPERIAL MINING COMPANY. Location of principal place of business San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 24th day of July, 1896, an assessment (No. 37) of One (1c) Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 35, third floor Mills Building, corner of Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of August, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 22d day of September, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
C. L. McCOY, Secretary.
Office—Room 35, Third Floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

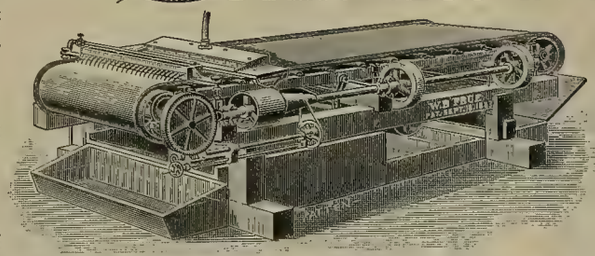
FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

No. 1883.—VOLUME LXXIII. Number 6. SAN FRANCISCO, SATURDAY, AUGUST 8, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

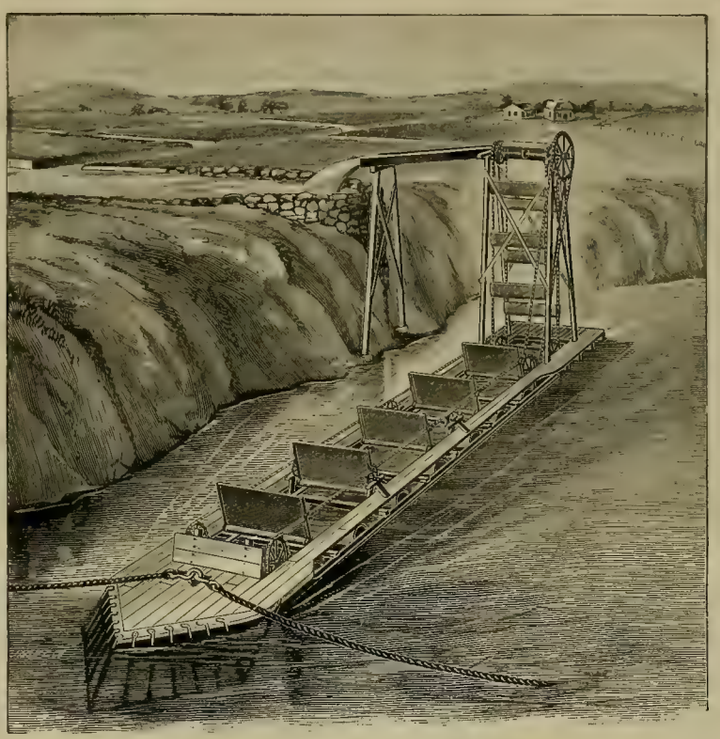
A New Amalgamator.

The fact that a large proportion of free gold and silver is lost during milling operations when such metals exist in the ore in a fine state of division is perhaps too well known to need mention. Much time, thought, labor and means have been devoted to investigating the causes of this heavy loss, and the ingenuity of mill men has been taxed to the utmost to devise methods for its perfection.

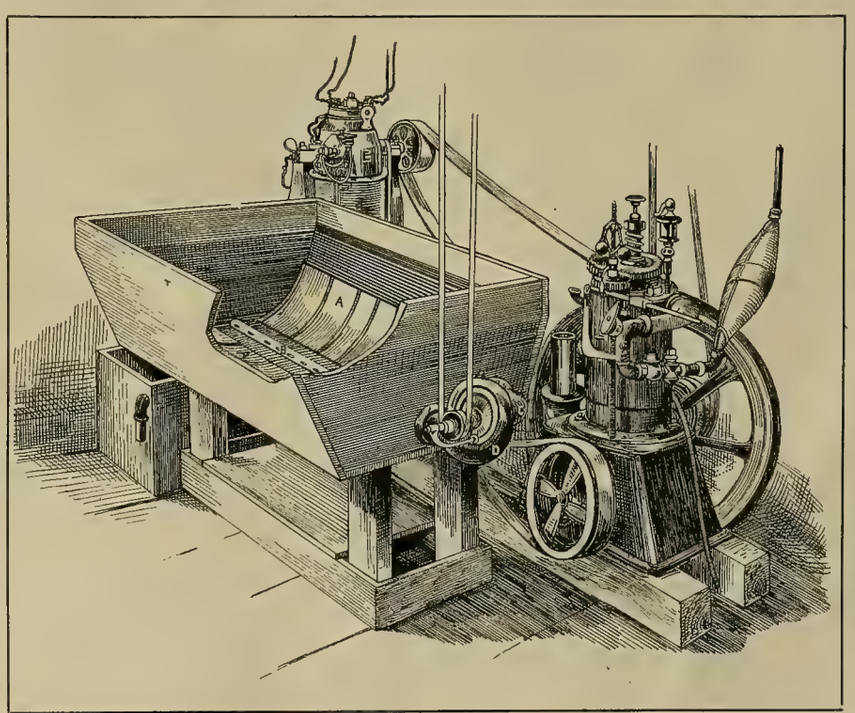
Since pure gold and silver present no difficulty in amalgamation, the failure to extract full values from the ores described must be attributed to the mechanical rather than chemical difficulties in the process of reduction. Under the usual system the auriferous pulp is carried from the battery by a stream of water over amalgamated plates set in the mortar, on the apron, and in the sluices, and it is assumed that the precious metals will be deposited upon these plates by the action of gravity, since the specific gravity of gold to water is as 19.3 to 1. But under some conditions this high specific gravity is not sufficient to insure success. In spite of care and constant vigilance constant losses occur in mills where ores assaying high work low, owing to the extreme fineness of values contained.

Many plans have been devised to save this fine gold and silver, one of the most successful being the system of arranging the plates in a series of steps or drops, where the stream of water and pulp are broken by a vertical fall of several inches. A good many amalgamating machines are in the market, in a greater or less degree working on the specific gravity principle. A departure from that method is designed in a new amalgamator, herewith illustrated, made by some San Francisco men, whose office is room 214 Safe Deposit building, this city.

The machine consists of a rectangular tank (T), having its bottom so constructed as to form curves on both sides of the center. Upon these curves the amalgamated plates (A) are set. They are designed to produce a deflection of the currents issuing from the side of a pipe (B) placed upon the bottom and longitudinally in the center of the tank. The pipe is perforated on each side by slots arranged in a line near the bottom. A short pipe (C) enters the tank at one end, placed above the first one mentioned, and so situated that it will always be covered by the charge. This pipe is open and serves for suction or intake. A centrifugal pump (D) connects the two pipes. For treating refractory ores electrodes, connected with a dynamo (E), are used in the tank. When the tank has been filled to the proper depth by the charge of pulp and water the pump is set in motion. The mass, being drawn into the short pipe, passes through the pump to the lower pipe, and is there impelled through the slots against the curved surfaces by the action of the pump. Deflected by these curves, the currents pass to the top and are there deflected inward. The pulp accompanies the water as it is impelled against the plates, and, according to the idea of the inventor, the precious metals contained therein are instantly caught and held by the amalgamated surfaces. This action is repeated until the pulp is exhausted of its values and the charge is renewed.



A NEW CURRENT MOTOR.



A NEW AMALGAMATOR.

A New Current Motor.

The term "current motor" is applied to a mechanism that utilizes the power of the stream or current of a river in such a way that it can be applied to run machinery.

A current motor, it is claimed, can be used without a dam in any location in a river where the water is deep enough to admit it. There is almost no limit, the manufacturers claim, to the use to which the power generated by a current motor can be applied. For example, it may be used for generating electricity for electric lighting purposes, but its chief use will be in connection with irrigation and mining.

The motor herewith illustrated has been experimented with and tested and its practicability is fully believed in by its makers, the F. C. Austin Manufacturing Co. of Chicago, who claim that the only limit to its power and amount of water that can be pumped is the dimensions of the paddles, the number of them and the force of the current. The machine, which is represented as anchored in the river, consists of a pontoon carrying two endless chains, to which are pivotally attached at suitable distances reversible paddles, having floats at their upper ends that buoy them up in their course through the water. These paddles enter and leave the water in such a way as not to detract from the efficiency of the machinery, but calculated to rather add to it. To the wheels put in motion by these cables is attached an elevator carrying large buckets, which when entering the water to fill themselves, it is claimed, add to the generation of power and are so arranged that when they reach the top of the elevator they discharge their contents with little friction into a trough, there to be conveyed to the shore, where a reservoir has been constructed to collect the water and distribute it through canals and lateral ditches.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 220 Market Street, Northeast Corner Front, San Francisco
☞ *Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

Our latest forms go to press on Thursday evening.

J. F. HALLORAN.....General Manager

San Francisco, August 8, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—A New Current Motor; A New Amalgamator, 105. Hon. Tirey L. Ford, 110.

EDITORIAL.—A New Amalgamator; A New Current Motor, 105. American Manufacturers in Brazil; Methods for the Preparation of Timber for Underground Use; The Recent Appropriation by Congress; "Suspension of Assessment Law;" Narrower Gauge; Liquid Air Considered Commercially, 106.

SCIENTIFIC PROGRESS.—Compressed Air for Street Cars; November Meteors; Explosions in Mines; Curious Colors of Aluminum Alloys; A Pendulum Instrument; An Aluminum Quadrant Devised, 112.

MECHANICAL PROGRESS.—The Power Plant at the Corral Hollow Coal Mines; A New Boat; Casting German Silver; Gold Not the Highest Metallic Standard; Abandonment of Profit Sharing, 113.

ELECTRICAL PROGRESS.—Useful Electrical Force; In Kern Co., Cal.; A New Telephone System, 113. Transmitting Electricity Long Distances; Controlling Interest in Tuolumne Electric Light and Power Co.; Electric Lighting Companies in Japan; Monterey Power Co. Resumed Work; Electric Lighting Plant at Quincy; Petaluma Electric Light Co., 114.

PRACTICAL INFORMATION.—A Drop of Water; Resistance of a Train; "Overexertion;" Turquoises from Persia, 114.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 116–7–8.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 126.

MISCELLANEOUS.—Concentrates, 107. A Go'd-Paved Valley; The "Inventive" Faculty, 108. Complimentary Contemporary Comment; Rock in Place; Gold Deposits in Nicaragua, 109. Tirey L. Ford's Report, 110. Gold Milling at Grass Valley, Cal., 111. Glossary of Mining Terms, 112. Co-operative Gold Mining in Australia; Recent Additions to the Collection of the State Mining Bureau; A Vibrating Helmet, 114. California Mines and Miners, 115. Commercial Paragraphs, 116. Coast Industrial Notes; Obituary; Personal; Recent California Mining Incorporations; Recently Declared Mining Dividends, 119. Notices of Recent Patents; Annual Report of the California Debris Commission, 127.

THE party of American manufacturers now visiting South America have arrived in Brazil. In this regard a translation of a recent commercial article in a Chilean paper, which appears on page 119, is of present interest to Pacific coast manufacturers and merchants.

SEVERAL methods are in vogue for the preparation of timber for underground use where desired to be preserved from decay. The creosote process is probably the best. The wood is placed in an air-tight tank, a vacuum formed, and creosote pumped in at a pressure of 150 pounds per square inch, at a temperature of 120° F. Soft wood will absorb from 8 to 10 pounds per cubic foot, hard wood from 6 to 8 pounds. Steeping in naphthaline is also attended with good results, especially in the case of green timber. A mixture of salt and chloride of magnesium for dry wood will preserve it, and also render it incombustible.

REGARDING the recent appropriation by Congress of $250,000, there is this to be said: the Legislature of California made similar appropriation of similar amount in '93 contingent upon just such an appropriation as that recently secured. The Congressional appropriation was in mind when the State appropriation was made. Each appropriation was in good faith, the State and Nation have each complied with all the requests and all necessary conditions and nothing remains on that score but to apply the money so given. It is not in order to raise cavil or question motives or seek for technical flaws, but to keep faith, public and private, so expending the money as to best serve the interests of all concerned.

ANSWERING several suggestions from southern California, it is not believed to be good policy to attempt any repetition of the "suspension of assessment law" as enacted by Congress in July, '93, and November, '94. True, a southern California Congressman — McLachlan — introduced such a bill last December, but it was promptly and properly squelched. The whole matter has been discussed in these columns at considerable length. The act was a relief measure in '93 and a sort of sop thrown to claim holders in '94, but it was more of a loss than a benefit to the mining districts. A man who wants to hold a mining claim ought to put $100 in work or improvements on it every year. If it isn't worth doing that it isn't worth anything. While it costs money to buy powder, tools and food, and many a good man owns a good claim, though poorly equipped to develop it, yet it is just such men that are least benefited by the operation of such an act as that passed in '93 and '94.

Narrower Gauge.

In addition to some editorial remarks last week regarding the need and feasibility of narrow-gauge railroads connecting mining regions of this State, it is worthy of note that engineers now recognize the possibility of successful construction of such roads on a narrower gauge than was thought possible a few years ago. It was for some time held that even a three-foot gauge was impracticable, but recent construction of roads with but a two-foot gauge has shown the economic success of so limited a roadbed. Several such roads have been built in the State of Maine and are now in successful operation. They offer advantages in point of accessibility to mountainous regions where excessive curvatures are met and compare most favorably with cost of construction of roads with wider gauges, being also capable of conveying freight and passengers on a paying basis, being financial successes where roads more costly in construction and maintenance would be failures. Outside this country is an illustration in the case of the Zancudo Mining Company's Railway in South America—a two-foot gauge road, built where conditions precluded construction of anything wider. This road was built where occurred several curves of forty feet radius and in one place around a high rock cut at the head of a water course in a deep ravine which would have cost several thousand dollars to change. This road, twenty miles in length, does a regular freight and passenger business, the former running on a schedule of sixteen miles and the latter eighteen miles per hour. A similar road has also been built for the Sinaloa, Mexico, Silver Mining Co., which is likewise in successful operation.

On the Zancudo road the grade was five feet wide, ties four feet long, four inches thick to seven inch face, 2700 per mile, the rails cost on the grade $48.50 per ton. The spikes used were ⅝x4 inches. The average cost of grading, except rock cuts was $650 per mile; the rock cutting cost 70 cents per yard.

A still narrower gauge, twenty inches, is that of the Arizona Copper Co., Clifton, Arizona, on which a 17-ton engine is now running on a 24-pound per yard rail. The builders of the Zancudo road are now constructing a road in that country on a .6 metre—23.725 inch gauge.

The advantages are evident: First cost of construction would be much less, as sharper curves can be introduced, heavy excavations and embankmens avoided, cost of grading lessened at least one-half and correspondingly cheaper rolling stock procured, besides decreased expenditures for ties and rails, lighter cost of ballasting, surfacing. The cost of maintenance is also manifestly less than even for what is generally considered a "narrow gauge road."

There are disadvantages, but in a mountainous country, with steep grades, sharp curves and limited traffic, it is believed that the slow time, breakage of bulk, transfers, etc., would be more than counterbalanced by the improvement over stage and team. It is believed that the estimated cost as published last week could be still further reduced in such an instance as the one cited, where a narrower gauge road was built. That such roads pay is beyond question. The Antofogasto, Potosi & La Paz Railway—Chili-Bolivia, South America—is 570 miles long, laid with 30-pound rail. In '95 that road handled 870,000 tons of freight and carried nearly 2,000,000 passengers without a single accident, and with a light equipment, the heaviest locomotive weighing six and one-half tons. The gauge of that road is twenty-three inches. The net earnings for the year were 20⅝% of the total cost of construction and equipment.

This matter of narrow gauge roads has an intimate relation with California's mine development and is considered worthy the attention of those who in a large way are engaged in that work.

Liquid Air Considered Commercially.

An interesting illustration of the rapidity with which purely scientific discoveries frequently become the starting points of new industries is furnished by the case of liquid air. It is not a long time since liquid air was produced for the first time in quantities great enough to admit of its application for purposes of research, yet steps are already being taken to treat liquid air as an article of commerce and to turn it out upon a large scale.

As in most cases of the kind, laboratory methods require modification to suit the needs of wholesale production. Patents are being taken out for machinery which, though constructed upon the principles of that used for purposes of research, will attain the desired end with greater directness and with the omission of several intermediate steps. The necessary reduction of temperature to the critical point of air has hitherto been effected by the successive employment of liquefied gases boiling at lower and lower points on the scale. But the final decrement of heat has been won by the cooling effect due to the rapid evaporation of the product itself. The new apparatus dispenses with the use of these intermediate cooling agents and relies entirely upon initial compression by powerful engines and subsequent partial expansion of the compressed air under carefully regulated conditions.

Most people probably have seen, at one time or another, the familiar lecture-room experiment of forcing a piston suddenly down a cylinder and showing the ignition of a scrap of touch paper by the heat thus produced. If, while the compression is maintained, the cylinder and its contained air be cooled to the original temperature, then, on suddenly withdrawing the piston and allowing the air to regain its original volume, there will be a fall of temperature corresponding to the rise on compression. If, now, the cooled air could be used to reduce the temperature of a second quality of air before expansion, it is evident that, starting from a lower point than the first batch, the second would, on expansion, reach a lower point. This is the first principle of the new liquid air apparatus.

A powerful engine compresses air, which is cooled, as far as possible, by ordinary refrigerating methods and passed into a spirally coiled pipe over 100 yards long. This pipe is enclosed in a second spiral. By means of a throttle valve at the end of the inner spiral, a certain proportion of the compressed air is allowed to expand in the space between it and the outer pipe. Thus, the stream of compressed air from the pump is cooled by that portion which has been allowed to expand, and arrives at the throttle valve in a colder state than the portion that preceded it. Consequently, it reaches a still lower temperature on expansion, cooling yet more powerfully the advancing stream in the inner tube. By carrying this cumulative cooling effect sufficiently far, the circulating air is at last brought down to its critical point and liquefies, after which a continuous stream of liquid air is merely a question of engine power.

It is impossible, without the aid of diagrams, to explain clearly how the continuity of the process is maintained, but the cycle of operations can be readily apprehended. There is compression, expansion in a closed chamber and utilization of the cold thus produced to repeat the cycle from a lower initial temperature.

The inventor's apparatus produces a substance for which there is already an industrial demand—oxygen gas. During the process just described, the air becomes steadily richer in oxygen until that gas forms some 70 per cent of the product. This relatively pure oxygen is sufficiently good for certain purposes, and it may be further purified from nitrogen if desired.

The price of oxygen gas thus obtained compares favorably in respect of cost with that produced by the methods now in use. It is apparent that this process is an affair of engineering far more than of chemistry. This remark applies to many of the most important and lucrative manufacturing processes of the day, and engineering chemistry, or chemical engineering, is to-day one of the foremost factors in the world's progress.

Concentrates.

UTAH mines paid $162,000 dividends in July.

SAN BERNARDINO, Cal., wants a "mining exchange." Why not?

THERE are 55,000 men now employed in the mines at Johannesburg, South Africa.

THE shares of the Anaconda Mining Co. will be quoted on the Paris Bourse next month.

QUIGLEY, Montana, will have a new 100-stamp mill in operation at the Golden Scepter next month.

P. KEYES, Beveridge, Inyo Co., Cal., cleaned up $3000 last week and wants to build a 10-stamp mill.

SINCE Oct. 16, '95, the receipts of the California Miners' Association have been in the neighborhood of $8000.

LEAD is now down to about the lowest figure in the history of its production in this country -$2.85 per 100 pounds.

CARIBOO, B. C., hydraulic miners figure the cost of washing a cubic yard of gravel at 5 cents—a moderate estimate.

THE value in gold production of each man's work in the Rand, South Africa, district in '95 was $695; in '94, $800.

COLORADO miners estimate that there are $30,000,000 in low grade ore on the dumps that will now pay to concentrate.

PETTY THIEVES, the bane of every rich "specimen" gold mine, are at work at the Gilt Edge mine, Fergus, Montana.

A TWENTY-STAMP mill for custom ore is stated to be the present greatest want at the new camp of State Line, Nevada.

THE next meeting of the U. S. Debris Commission will be held at their room, 59 Flood building, this city, Aug. 24th, '96.

WORK has begun on Montana's new school of mines at Butte. It will cost $88,000 and will be finished August 1st, '97.

THE 1896 convention of the California Miners' Association will be held in Pioneer Hall, in this city, beginning November 10th.

SAM'L Newhouse of Salt Lake, Utah, has an option on the Holtz and Empire, formerly known as Amador No. 2, for $200,000.

ROSSLAND, B C., papers report a "rush" from there to the north fork of the Salmon river, where unusually rich placer ground is reported.

THE Alaska-Mexican new 60-stamp mill, Douglas island, Alaska, is completed and will shortly begin increasing that property's bullion product.

A RECENT cloudburst in Cat Creek, Esmeralda Co., Nevada, uncovered a 12-inch ledge of $40 ore, which was promptly located and is being worked.

DURING July the two Helena, Montana, land commissioners classified 14,000 acres of land. Pity a similar statement could not be made regarding California.

AT THE recent rock-drilling contest at Rossland, B. C., Davis and Stevenson won the purse and championship, drilling 36¼ inches in fifteen minutes.

LARGE holders of Boston & Montana stock figure that at the present price of copper the company is earning $22 per share per annum, says the *News Bureau*.

AT Helena, Montana, last week, John S. Harris, a "promoter," was awarded $3000 commission due him from Murray Bros. on the sale of the Prize mine.

MRS. MCGRUER has been elected a member of the Karangahake, New Zealand, Miners' Union, believed to be the first instance of the kind on record—in New Zealand.

THE Champion Mining Company, Nevada City, Cal., has bought the Spanish mine, through which the Merrifield mine will be worked. The price is stated to be $20,000.

"SILVER rises above party," says the Butte *Inter-Mountain*. It is a noticeable fact that through all the recent favorable action by political conventions, it does not rise above 68¾.

D. KEITH of Salt Lake, Utah, has bought a two-thirds interest in the south extension to the Virtue mine, Baker City, Or., now known as the Con. Virginia. Jno. Vass is resident manager.

THE Morris Ravine, Butte Co., property, is in the hands of an English company with $75,000 capital. It comprises nearly three miles of ancient river channel. The tunnel being driven is making fair progress.

DURING July the Alaska Treadwell Mining Company sent 20,513 tons ore to its mill which averaged $3.72; 365 tons of sulpherets were also treated. The bullion product was $76,260; expenses $22,563.

THE biggest kind of a mining "boom" is reported from Tasmania. A long account of the great mining activity, to hand, fails to intimate whether the properties so glowingly described are gold or silver.

AN eastern paper thinks that the silver claim of 16 to 1 is absurd, adding that the most radical advocate of free silver coinage ought to be satisfied with a ratio of 12 to 1. This is, indeed, a "campaign of education."

J. B. HOBSON thinks the Cariboo and Horsefly mines, Quesnelle Forks, B. C., will make a good showing at the close of the season. It is calculated the Cariboo mine will send down $200,000 as the result of the cleanup.

SOME two years ago $200,000 was paid for the Bonanza mine, Harqua Hala, Arizona. It was recently considered worked out, and was turned over to leasers, who recently uncovered at 200 feet a four foot body of $50 ore.

ACCORDING to a local paper a California miner, stranded at Cook's Inlet, Alaska, writes to a friend as follows: "Offer a premium at your next fair for the 'biggest fool in the country,' and I'll try to get there in time."

THE usual practice in prospecting in West Kootenay, B. C., is to prospect in twos and threes. Each man stakes in his own single name and then records transfers of an even share with his partners, in his and their claims.

SUPERINTENDENT CAMPBELL of the Browns Valley, Yuba Co., mine denies local reports of a cut in wages and says since he took charge he has advanced wages, now paying practical miners $3 for underground work and $2.50 to helpers.

AT the Uncle Sam mine on Squaw creek, north of Redding, Cal., last Tuesday, M. Hostetter, a miner in the employ of the Sierra Buttes Gold Mining Company, was struck by a falling rock and knocked down an ore chute. He fell a distance of 200 feet and was fatally injured.

IN Amador, Nevada and other counties teams are practicing for the hand drilling contest at the State Fair next month, when $800 in prizes will be awarded. Those who propose entering for the contest should so notify Edwin F. Smith, the secretary at Sacramento, before Sept 1st.

THE excitement and distraction of the presidential campaign need not deter the California miner from going right ahead in augmenting the "flood of gold" that our English friends say is such a probable calamity that it may result in the demonetization of the yellow metal.

IN Sacramento county F. D. Ryan, District Attorney, and R. T. Devlin, representing the anti-Debris Association, have secured a temporary injunction against J. R. Vandergrift and a number of others from mining by the hydraulic process on the headwaters of the Cosumnes river.

PARTIALLY after the fashion of Congress in '93 and '94, the British Columbian Gold Commissioner has extended the time of sixty days from July 17th, for the completion of assessment work on such mineral claims as he has cause to believe are inaccessible in consequence of the depth of snow which covers the claims.

AMONG the present curiosities of mine "promotion" or degradation is noticed the "Antimony-Gold-&-Complex-Ores Extraction Co.," with a capital of $1,750,000, of which $1,500,000 goes to the alleged patentee for his valuable process of ore extraction, which has been more or less familiar to the mining public for the last twenty years.

TO READ an incription on a silver coin which by much wear has become wholly obliterated, put the poker in the fire, when red hot place the coin upon it, and the inscription will plainly appear of a greenish hue, but will disappear as the coin cools. This method was formerly practiced at the mint to discover the genuine coin when silver was called in.

THE purchase recently noted by the New Idria Quicksilver mine, in San Benito Co., by the trustees of the Napa and Etna Quicksilver Mining Companies will result in the full development of the property, and the operation of new works now in progress of erection. The mine has produced at times, a monthly average of 1500 flasks of 76½ lbs. each.

THE total Australian gold yield from the discovery of gold in those colonies to the close of '94, was 94,967,451 ounces, valued at $1,852,333,615. Of this Victoria furnished 59,000,000 ounces; New Zealand 12,750,000 ounces. Victoria gold averages $19 per ounce; parts of Queensland as low as $12.50, though in Cloncurry, Central Queensland, it goes nearly $20 to the ounce.

THE Witwatersand, South Africa district, consumes 120,000 cases dynamite annually. It costs the companies there $21.25 per case; at Kimberly $15.75. Nobel's sell it in Kimberly for $12.50 per case at a profit. It is locally figured that under better business arrangements it could be sold at $8.75 per case on the Rand, saving the mines there an overcharge of $2,000,000 annually.

THE installment plan of providing capital for developing a mining property (no reference to assessments) is often found to work satisfactorily. When there are no ornamental salaried officers and the proceeds of the sale of the working capital stock is devoted exclusively to the development of the mine, the stock not delivered till fully paid up, it usually affords safe opportunity for small individual investments.

THE Humboldt, Nev., sulphur mine is about forty miles from the railroad at Humboldt station. It has been worked about eighteen years. An attempt is now being made to operate it. The crude material has to be carted a distance of four miles to the refinery. This is undoubtedly a valuable property, but will require some outlay to develop it in a business way. The refinery is located about four and a half miles from the point where the sulphur is extracted

SOME time ago in Amador county, the Keystone Con. M. Co. sued the South Spring Hill M. Co. for damages, amounting to nearly $2,000,000, alleged value of ore extracted from plaintiff's ground. The case was transferred to Calaveras county. A motion by defendant for permission to enter and inspect plaintiff's premises, claiming that the latter was trespassing upon the dip and end lines of the former's claim, has been granted by Judge Gottschalk, the time being limited to the 30th inst.

THE oil-burning locomotive for the Congress Gold Company, of Congress, Ariz., has been tested on a trip over about 30 miles of the D. A. V. & P., which gave the desired up and down grade similar to that of the road for which it is intended. It went up the hills with a string of 20 freight cars, under the supervision of G. W. Prescott, of Highlands, Cal., the inventor of its oil-burning device. The engine is also adapted for switching in cities or in tunnels where there may be special danger of fire from sparks.

AT THE Congress mine, Arizona, the shaft is now down 1800 feet and 350 men are employed under ground. In addition to a cyanide plant with a capacity of 100 tons, there is a 40-stamp mill which runs day and night, and forty more stamps are to be added. About four miles of tunnels, shafts and stopes have been run. Beside the 1800-foot shaft, two others have been sunk to depths of 700 and 1100 feet respectively. Cross-cutting to the second vein has been commenced. The present output of the mine is $80,000 per month.

IN these days of presidential campaign dullness and financial distress the activity in mining is a Godsend to business men. A State like Washington, where the cities outgrew the country and stagnation resulted, is kept up now by mining enterprises and developments. Spokane, in some ways Washington's chief city, is prospering by control of British Columbia mining properties; Butte and its great mining industries keeps Montana prosperous; and so it may be said of nearly every commonwealth west of the Rocky Mountains. In our own State the most profitable market home producers now find is in the purchases of those engaged in gold mining.

COLORADO'S railroad competition has ceased and the old rates on ore have been resumed. The Colorado Midland and the Midland Terminal road dispute affected the mining industry at Cripple Creek. The former road runs to Divide, where junction with the latter is made for Cripple Creek, 30 miles distant. The Terminal has no cars, having used the Midland's previously. Freight over the two lines to Colorado Springs was abandoned about four months ago. The Florence and Cripple Creek road had been doing a considerable business in connection with the Denver and Rio Grande, but this road's 400 cars proved inadequate, and quantities of ore were banked at the mines.

AS TO the Colorado leasing system, referred to on page 85 of last week's issue, it consists, substantially, in a contract with the owners, leasor agreeing to do a stated amount of development work to keep a certain number of men at work during the continuance of the lease, and pays a royalty of a certain per cent when shipped, varying from 10 per cent on low grade to 35 to 40 per cent on high grade. This royalty is usually figured on the proceeds of the ore after deducting freight and treatment charges. Suppose the gross value of the ore were $50 per ton; freight and treatment, $12; the royalty would be whatever per cent of $38 had been agreed upon. It is generally customary to get a bond running with the lease, but the amount paid as royalty is seldom applied as part of the purchase price, the royalty being considered as rental only. The contracts are made from nine to eighteen months—a year being the general term. A failure to do a certain number of days' work in any one month makes a forfeiture, so the property is not tied up without a consideration. The bond price is usually made larger than it would be on a cash basis.

A SERIOUS fire and explosion was narrowly averted at the Portland mine, Victor, Colorado, last Saturday by the presence of mind of some of the employes. A miner coming off shift carelessly stuck his candlestick, in which was a lighted candle, into the side of the new Burns shaft house over a box in which were giant powder, caps and fuse to be used for blasting purposes by the shift of men who had just gone to work. The candle fell out and ignited a mass of paper behind the box of explosives. Williams, the engineer at the mine, and a miner named Smith saw the burning material and hurrying to the spot removed the powder before it took fire. They then extinguished the flames.

THE decision of the privy council of Great Britain in what is known as "the precious metal case" has been given, and sustains the two judgments of British Columbia courts. The point was whether or not gold or silver within lands passing to the Esquimalt & Nanaimo railway by their grant from the Crown thereby became the property of the railway company, or remained in the same position as elsewhere located, sought by the miner. This point, submitted to the supreme court of Victoria, B. C., in a test case, was decided in favor of the Government. This appeal was then carried by the railway company to the higher tribunal, whose judgment is confirmatory of the decision of the courts below.

THE North Bloomfield case was before the U. S. Circuit Court in this city this week. It involves the constitutionality of the Caminetti law. Action was begun by the Federal Government, at the request of the California Debris Commission, to restrain the North Bloomfield Mining Co. from continuing hydraulic mining without receiving permission from the California Debris Commission. A demurrer of the defendant company was overruled. The argument this week was upon the answer to the complaint, in which the claim was made that as only light matter was being sent into the Yuba there was in consequence no injury to the stream and the California authorities had no right to interfere. Judge McKenna is trying the case. The argument was closed and submitted last Thursday.

SINCE 1856 Grass Valley and Nevada City, Nevada Co., have produced $148,000,000 in gold. This is not by any means the whole of Nevada county's contribution. The Bloomfield district and the Idaho-Maryland group and other famous districts of that one county have turned out millions. East of Wolf creek, including the Empire (which is down 2200 feet) the yield has been over $20,000,000. The total is but an index of the gold wealth yet to be developed, and Nevada is but one of thirty-seven mining counties of the fifty-seven comprising the State. The belt on the east side of Wolf creek, not including the Idaho-Maryland group, but taking in the Empire and the mines to Slate creek, also the Norambagua and the Shamrock, has produced $21,962,742. The Empire is down 2200 feet, being the deepest in the group of seventy gold mines.

QUICKSILVER melts at 39°, evaporates slightly at ordinary temperature, boils at 662°, and volatilizes at 680°. Its specific gravity is 13.6 at 32°. Two thousand and thirty-eight cubic inches weigh one pound. One cubic foot weighs 847.89 pounds. In a column of quicksilver, every foot in height gives a pressure 5888 pounds per square inch. That quicksilver will pass through a smaller aperture than water is a popular fallacy, naturally deducted from the fact that the former will often leak from a vessel that will hold the latter. An explanation of this seeming paradox is that quicksilver, being so much heavier, gives far greater pressure, and in wooden vessels, water having the finer penetration, enters the fibre of the wood and swells it, thereby closing small openings, whereas quicksilver, entering only the open grain, has no expanding effect.

PHILIP DEIDESHEIMER has brought suit against W. H. Hollister, A. N. Butts and others to recover 16,666⅔ shares of stock in the Golden Gate Mining and Milling Company, or its value, which is estimated at $40,000, together with exemplary damages in the sum of $10,000. The plaintiff alleges that he owned a sixth interest in the Mabel, Noonday, Grasshopper and Gold Dipper lodes, Camp Floyd district, Utah, and that at a certain time Hollister, then president of the company, came to him and, under the pretense that such a procedure would facilitate a sale of the property, induced him to transfer to him all of his stock; that this transfer was made in the presence of witnesses and was clearly understood to be only a formal transfer, the property right being still vested in himself; that thereupon Hollister transferred this property to his wife Augusta, for no valuable consideration, its object being solely to deprive Deidesheimer of his rights.

AT a meeting of the executive commmittee of the California Miners' Association in this city last Monday T. L. Ford, who represented the association at Washington, D. C., for four months ending May 22nd, reported his expenses for that time were $3211.25. He had received $2950. It was decided to reimburse him for the excess of expenditures, $261.25, and pay him $1000 for his efforts in behalf of the association. Resolutions were adopted thanking him for the zeal and ability he had displayed in behalf of the mining industry of the State. Mr. Ford was absent from the room when the proposition to pay him the $1,000 was adopted, and, upon learning of it, wrote a letter to President Neff, in which he says: "No one could appreciate more highly than I do the sincere and worthy motives that governed the committee in their attempt to thus recompense me for the time which I had the honor to devote to the cause which we all have at heart. On the other hand, the committee could scarcely have taken any action that would have been more at variance with my personal desires. While profoundly grateful for the kindness thus intended to be shown me, and deeply moved by the kind expressions of personal regard so freely tendered me by yourself and others at last evening's meeting, I must, nevertheless, decline to accept any pecuniary compensation for the humble services I have rendered the California Miners' Association."

A Gold-Paved Valley.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

In the course of the untold ages during which they have had an existence the rivers of the Sierras must have carried down and deposited in the level valley region of California hundreds and thousands of millions in fine gold. Gold in its native state is a very soft metal, and, as is well known, suffers great loss from attrition. Even after the metal has been hardened by an alloy of copper and coined, it is rapidly worn by handling. Gold coin always loses more or less by attrition during transportation, however carefully it may be moved and carried. The loss sustained when large quantities of gold coin are shipped to and fro across the ocean is astonishing. Whenever a gold coin is subjected to motion and friction it loses more or less in substance. When carried in the pocket, and even while passing from hand to hand, it is wearing away.

The amount of gold found to accumulate in a few months in the tanks in which the workmen in large jewelry manufactories are required to wash their hands is quite surprising, and in the course of time the floors, carpets and all the interior parts of such establishments become very profitable auriferous deposits. There being such loss of gold with the most careful handling, one may form some idea of the tremendous wear and tear that must have occurred when the soft native metal was subjected to the grinding action of the boulders and gravel of the steep and swift California rivers.

For ages and ages before the discovery of the auriferous deposits of California, gold must have been carried down from the great hills and mountains, constituting or contributing to build up the Sierra Nevada range, at first through the old dead rivers and afterward through the present river system. Owing to the precipitous character of the creeks, canyons, gulches and river channels in the upper parts of the western slope of the great range, vast quantities of gold must have been carried down into the valley region, in which the beds of all streams are comparatively level. At times of great freshets, when there were big rushes of water from unusual accumulations of snow in the high Sierra, tolerably coarse gold would be swept down through the steep rocky troughs constituting the channels of all the large streams. In the big spring floods boulders weighing many tons are sent bounding down these big stone troughs like tenpin balls. At such times, not only fine gold, but also large nuggets, would be gradually driven down toward the level of the valleys. They would eventually get there, as they would never move upward a fraction of an inch, and each big flood would carry them farther downstream if it moved them at all. Even when wedged into a crevice in solid rock a lump of gold is not anchored forever. We everywhere find places where the channels of rivers have worn down hundreds of feet. Thus it is not difficult to see that even the largest nuggets, from being ousted from their resting places and constantly driven from a higher to a lower level, must either eventually reach the valleys or be worn out on the way by the pounding and tumbling of boulders or the grinding of rushing streams of sand and gravel. When it is known that a gold coin suffers loss when passing from hand to hand, one may imagine what would be the effect upon a lump of the soft native metal mingling in a turmoil of whirling boulders and grinding gravel. It is a mill in which the hardest quartz is ground to powder.

This downward progress of gold from the mountains to the valleys doubtless went on for hundreds of thousands of years before the discovery of gold at Sutter's mill; therefore, it seems very probable that deep in the channel of the American, the Sacramento, and all the other principal California rivers, in their course through the valleys, there are immense deposits of the precious metal. As regards fine gold, it seems likely that a vast deal of it was swept through the streams to the level of the valleys in a short time after it was released from its matrix in the quartz veins. For ages while gold was thus being carried down through the rivers, the valley region was doubtless a bay. In this bay it is probable that a great deal of gold was deposited at no great distance from the mouths of the rivers, though the very fine particles might be scattered far and wide.

By far the greater part of the gold found in both quartz and placers is in fine particles. It is in the fine gold that the miner finds his regular pay, the nuggets coming in as so much extra—as accidental bits of good luck. Much of the gold in quartz and pyrites is microscopic, so fine as to be invisible even when an ordinary magnifying glass is used. It is because of this invisible gold that some ores yielding high assays show little or no gold in panning. The smallest particles of gold visible to the naked eye are about the 1-250 of an inch in size. A great deal of gold is of infinitesimal fineness. Under a microscope many particles are found to have a diameter of no more than from the 1 20,000 to 1-50,000 of an inch. Being of such smallness in the start, one may imagine the fate of such particles in passing down through miles of rocky canyons filled with rolling boulders. Only that it could not be, one would say that all such gold would be wholly lost. But, although infinitely subdivided, it would stop somewhere, though it might pass out into the ocean.

It is not unlikely that a great deal of this invisible gold found lodgment in the clay of the old river bars. If so, nothing would be seen of it in working the ground by ordinary mining methods, and even the most careful panning would show nothing. An assay of the clay of the pay channels of the dead rivers, of the big hydraulic mines and of other paying deposits might show it to be exceedingly rich. A vast deal of gold may have been lost to our miners in times past in the clay of the placers and river bars and channels. Probably a considerable amount of this would be redeposited when carried down to the level valley region.

Be this as it may, the valley country must be pretty well paved with gold, particularly where first entered by the Feather, American and other rivers that were rich in gold. It is probable that by sinking shafts at points near which these rivers entered the level country rich deposits of fine gold would be found by drifting on the bedrock. We have plenty of mining engineers who would readily undertake to put down a shaft and drift out beneath the present channel of any of the rivers. Some day miners will go into this valley region, sink shafts and set to work to recover the gold brought down by the rivers and deposited on the level or in the waters of an ancient bay.

Most of the gold may have been very fine, but it all found lodgment somewhere. It is almost impossible to annihilate gold. Even when gold coin has been worn away by being carried in the pockets of the people, or in passing from hand to hand, some trace of it can be found. Some time ago an American scientist took samples of mud from the streets of different quarters of London and carefully analyzed it. Mud taken from the busiest parts of the city showed quite an appreciable amount of gold and silver, with copper, tin, iron and some other metals. Mud taken from the poor districts showed some iron and copper, with very minute amounts of silver, but the most delicate tests failed to reveal even a trace of gold. One can hardly imagine the fineness of the particles of gold thus shed abroad.

How gold gets into some of the places where it is found is a mystery. Some time ago an Oregon paper, in noticing a new mining district, put in as a joke that the bark of the pine trees gave very good assays in gold. Now it seems to be a fact that gold does in some way get into the pores or fibers of certain trees or vegetable growths. About half a century ago Mr. Sage, a professor of chemistry in Paris, made a curious experiment. He collected and burnt a quantity of vines that grew near the banks of the river Seine. From the ashes of the vines he obtained enough gold to coin three napoleons. The experiment created quite a sensation at the time, but there was not much profit in it, as each of the twenty-five franc pieces thus produced cost the professor one hundred and twenty-five francs.

It seems that in the river Seine a small quantity of gold exists in a state of division so fine as to be invisible to the unaided eye. It is said that when the sand of the river near Paris is used in making glass the crucibles in which it is melted are frequently found to be gilded over at the bottom. In former times a sort of mining was practiced on the Seine at Paris by a class of men similar to the ragpickers of the present day. These men would buy five francs' worth of quicksilver and after passing the sand of the river over it all day they sold it in the evening for six or seven francs. For some reason this work was finally discontinued. Almost all the rivers of Europe carry small quantities of gold in their sands. Such are the Rhine, the Seine, the Aar, the Reuse, the Danube, and others; also the Clyde and many other streams in Scotland, Ireland, Wales and Cornwall. The gold now thinly scattered in many places in Europe would make some rich placers were there to occur topographical changes by which the auriferous ground would be sluiced down and redeposited in compact form by the natural action of large streams. Though one ton of sand from the bed of the Rhine yields only nine and one-half grains of gold, or one-fifth of an ounce, yet the the total amount of the yellow metal in that one river is immense. It has been found by careful examination and calculation that that part of the Rhine alone which flows through what was formerly French territory contains no less than 36,000 tons of pure gold.

If there is so much gold in a short section of the river Rhine—never remarkably auriferous—there should be hundreds of thousands of tons of the metal lying in the old channels beneath the valley region of California, as for untold ages not one alone but scores of the most famous gold-bearing rivers ever known have been sending down and depositing on the level constant streams of gold.

Tests of the auriferous deposits beneath the valley might be made by boring at points near where the rivers leave the foothills. An experiment of the kind, giving full particulars in regard to the various strata passed through, would be of great interest and value. The cost of boring down to bedrock in half a dozen places would not be very great. The material of the different strata should be carefully assayed, as panning or sluicing would not show the very fine gold, which is supposed to predominate.

DAN DE QUILLE.

The "Inventive" Faculty.

Written for the MINING AND SCIENTIFIC PRESS by W. H. SMYTH, C. E.

(*Continued from issue Aug. 1 '96.*)

Fourth—That the law relating to patents which provides this requirement involving metaphysical distinctions also provides that decisions relative to these subtleties shall be rendered by mechanics, chemists, lawyers, etc., but never by expert metaphysicians.

My critic seems to have taken seriously my suggestion of replacing the examiners and judges in patent cases with "expert metaphysicians," whereas it was simply poking a little fun in a mildly sarcastic way at a law which required, as an element in a common contract, an "indefinable something," the presence or absence of which "involves fine, subtle metaphysical distinctions," and which at the same time provides that mechanics, etc., determine if these metaphysical requirements have been carried out according to contract.

Not the slightest fault has been found with our judicial system in this connection, but heartfelt sympathy was impliedly expressed for the judge called upon to decide a case involving "invention."

Patent office examiners are courteous and efficient; indeed, it would be difficult to find a more thoroughly conscientious and competent body of officials. It is the interpretation of the statute which is called in question, not the execution of its provisions.

The law calls for the presence of "invention" so as stated in the next proposition.

Fifth—Examiners and judges determine its presence arbitrarily. * * *

As this is entirely ignored, it is assumed to be admitted as a just corollary from No. 3, which is acknowledged to be true.

Attorneys at law without exception fear the defense in infringement suits which sets up want of "invention" in the device infringed. They know that the judge has nothing to guide him, no criterion. The only course open, therefore, is to make the patented device appear as wonderful and mysterious as possible, in an effort to impress upon the judge the amazing amount of genius required for its production; and the judge decides the question of "invention" in the same manner as the "average man."

Sixth—That it (the word "invention") should be removed from the statute and the idea eliminated from the practice both in the patent office and courts.

The reply to this is: "We should be compelled to substitute for it some other equally indefinable, and therefore equally objectionable, term."

This clearly is based upon a misconception. Substitution is *not necessary*—simply the *erasure* of a useless word and elimination of an erroneous interpretation. Section 4886 of the revised statutes reads: "Any person who has invented or discovered any new and useful art, machine, etc., * * * may * * * obtain a patent therefor."

So, unless my critic is prepared to saddle upon the word "discovered" all the occult, mystic, metaphysical meanings and curious attributes read into "invention," not omitting indefinableness, this criticism is without point.

Is it not strange that while all authorities are agreed that the word "discovered" in this section is absolutely synonymous with "invention" it has never occurred to the same authorities to hold that "invention" is synonymous with "discovered?"

A curious paradox, indeed.

This simple rearrangement of ideas, hardly amounting to a change, would put an end to all difficulty and confusion arising out of the conflicting and questionable, if not wholly erroneous, interpretation of section 4886.

This happy consummation is but one of the many and profoundly beneficial results which must inevitably follow from discarding the illogical and unscientific assumption that the production of new and useful contrivances "involves the spontaneous conception of ideas" to the exclusion of skill, knowledge and reason.

To summarize: It has been shown that the

Opening criticism is based upon a misconception and directed against an unwarranted assumption supported by illustrations in no way parallel.

That the first proposition develops a difference of opinion on a question of fact, which (decided either way) is immaterial to the main issue.

That the second proposition is left untouched, barring an unsupported assertion, which is at variance with the stated experience of acknowledged and constituted authorities on the subject.

That the third proposition is admitted as true.

That the fourth proposition, though ironically in-

tended, is strictly logical. The serious argument against its practical advisability amounts almost to reductio ad absurdum proof of the absurdity of the present legal interpretation of "invention."

That the sixth proposition is tacitly admitted, the criticism being directed wholly against a suppositious and uncalled for result.

That the fifth proposition is tacitly admitted by silence and by direct admission of the third proposition.

So that one proposition (No. I) is met by unsustained denial.

The criticisms on two (introductory and No. 3) are based upon misconception.

Three (Nos. 3, 4, 5) are either directly or tacitly admitted.

Upon this showing further direct comments are superfluous.

In the long and exceedingly fair-minded criticism of the *Engineering Magazine* only once does the writer feel that he has cause to complain, and, strange to say, the remark referred to is doubtless intended to be complimentary. It is as follows:

"* * * we dissent from the views expressed, * * * although we readily admit that *in their support* Mr. Smyth has presented a *very ingenious argument.*" The London *Engineer* tries to discredit the facts presented in the papers under discussion by the assertion, reiterated, that Mr. Smyth cannot have invented anything himself, or he would not talk as he does about "invention" and the "inventive faculty." And now the *Engineering Magazine* discredits the same facts on practically the opposite suggestion, that the "inventive faculty" is too much in evidence.

"Invention," the indefinable requirement of patent law, is from beginning to end an almost unbroken succession of dry, admitted facts, truisms and hackneyed quotations from acknowledged authorities, like beads on a string. Like beads, too, the stringing displays neither ingenuity nor lack of it; the presence or absence of those qualities in no wise effects either the (2) facts or the (1) beads. Both beads and facts would still be in evidence, whether strung by sage or, well, by the present writer.

Over thirty years ago the great scientist, Tyndall, relegated to the limbo of discarded superstitions the remains of the "spontaneous generation" myth. The death struggle of that tenacious old fetish is one of the earliest recollections of the writer. With the extinction of the idea of "spontaneous generation" as a factor in the production of living forms, bacteriology took its place among the recognized sciences.

If the present contention be well founded, and "Invention," the unrecognizable and "indefinable something," prove to be a relic of ignorance, with no foundation in reality—a myth—and industry, skill, knowledge and reason the real factors, as suggested in the answer to the question: "Is the inventive faculty a myth?" and also in the later paper, and that inventing is an art acquirable and cultivable, does not this mean the dawn of a true age of "invention"? Is it an unwarranted assumption that, under these conditions, the production of means to improve and facilitate man's adjustment to his environment will no longer be a haphazard groping in the dark, but instead, this class of mental industry will be systematized into a science of "invention"; that specialists in this science will be a distinct, recognized and organized branch of industry, engaged in devising new and better means to accomplish predetermined ends, to whom such work will be as much a matter of course and orderly routine as it is now to build a bridge fulfilling known conditions. Education cannot but be profoundly modified by the new idea of "invention." Is it not almost incredible that, notwithstanding modern civilization apart from the results of "invention" is unthinkable, the preparation of the youth has no bearing whatever upon this stupendous factor in the conditions under which he is expected to assume the part of an active and *intelligent* worker?

The direction in which education should be modified to meet the rapidly-changing conditions of modern times is towards the cultivation and improvement of the *physical* avenues of the mind.

Not for one moment would the writer desire to be thought of as depreciating purely scholastic training, or what is loosely termed "higher education." But this is an age of individual and concerted action of intelligent individuals—action, the result of knowledge and thought.

If I were asked to point out the distinctive characteristic of the latter half of the Nineteenth century, this peculiarity would receive careful consideration: the widespread increase of *thinking* workers, as distinguished from thinkers or workers.

Success is attained not by what a man knows, but what he *does*.

Therefore, education should largely consist in systematic training of the physical faculties—the eyes, the ears, the hands, etc.—through which alone knowledge is attained, so that impressions conveyed to the brain shall be accurate and undistorted; systematic cultivation of the faculties employed in recalling accurately previous impressions; systematic training and cultivation by exercise (under certain conditions (2) approximating commercial necessity) of the logical and (1) constructive faculties; all directed to the building up of personal initiative and logical thought, as displayed in constructive work.

Even the most insistent advocates for the sporadic and fortuitous gift idea of the "inventive faculty" concede the great advantage of systematic cultivation of the faculties, claimed by the writer to be those involved in the production of new and useful contrivances, to all who in the lottery of birth have failed of the capital prize "Genius."

San Francisco, July 16, '96. W. H. SMYTH.

Complimentary Contemporary Comment

The following, from a mass of similar kindly notices, valued and appreciated, are selected as illustrative of unsolicited opinions from various reputable sources of the standing and merit of this journal. Pages of such exceedingly complimentary reference could be published, but the following will suffice:

THE OLDEST AND THE BEST.

The MINING AND SCIENTIFIC PRESS of San Francisco has entered upon the thirty-seventh year of its existence, the oldest and the most ably conducted mining journal in the United States. Its very appearance is sufficient evidence that it has attained the success which is so deservedly its due as the reward of its faithful service and sterling merit.—Mining Record, Juneau, Alaska.

DESERVES MUCH CREDIT.

The MINING AND SCIENTIFIC PRESS of San Francisco is publishing a table giving the names of the mines of California, their character, the number of men employed, location, name of superintendent or owner and their postoffice address. The amount of work necessary to furnish these details is very great, and that valuable mining journal deserves much credit for placing this data before its readers. The PRESS does not claim to be absolutely correct, but has taken all the pains possible.—Colfax, Cal., Sentinel.

VALUABLE AND INTERESTING.

A most interesting article on Cripple Creek appears in the MINING AND SCIENTIFIC PRESS. Its comparative nature makes it valuable to any one who has ever mined in California, going as it does into detail explanations of the geological formations of both States. The article is illustrated with half-tones of famous properties.—Adviser, Pueblo, Colo.

DESERVING OF LIBERAL PATRONAGE.

The MINING AND SCIENTIFIC PRESS has completed its 36th year. It is a journal which has done much in behalf of the mining industry of the State and is deserving of liberal patronage.—National-Bulletin, Plumas, Cal.

ITS INTEGRITY BEYOND SUSPICION.

The MINING AND SCIENTIFIC PRESS has just celebrated the completion of thirty-six years of active, uninterrupted and highly useful existence. It is a journal that has done more for the advancement of mining and scientific knowledge regarding this coast than all the other papers put together, for the reason that its readers have learned to trust its statements and know that it is always well informed and its integrity beyond suspicion. The PRESS has our good wishes for its continued prosperity.—Investor, Los Angeles, Cal.

RELIABLE MINING NEWS.

Every week the special correspondent of the MINING AND SCIENTIFIC PRESS from our county capital furnishes a lot of reliable mining news from our county.—Georgetown, Cal., Gazette.

CONDUCTED WITH ABILITY, FAIRNESS AND HONESTY.

The MINING AND SCIENTIFIC PRESS of San Francisco is 36 years old. The PRESS is the oldest mining journal on the American continent, and from its very inception to the present time has been conducted with eminent ability and with that fairness, coupled with an honest purpose, which has never been questioned. In other words, it has never been charged that the columns of the PRESS were for sale to unscrupulous parties wishing to boom their wildcat schemes. The PRESS has within the last year gone even beyond its former efforts at usefulness, and the *Record* most heartily congratulates Mr. Halloran on his success as general manager of its columns.—Amador Record.

LOOKED UPON AS AN AUTHORITY.

The MINING AND SCIENTIFIC PRESS last Saturday celebrated its thirty-sixth birthday. It is the leading mining journal of the West, and is deservedly looked upon as an authority. Its merits grow with its years.—Inyo, Cal., Register.

ABLE, EARNEST AND FAITHFUL.

The MINING AND SCIENTIFIC PRESS has completed its seventy-second volume. It was established in 1860 and has continued uninterrupted up to the present time. An able, earnest and faithful advocate of the mining industry and manufacturing interests, it has well earned the reputation of being one of the best publications on this coast, and fully deserves the liberal patronage it receives.—Downieville Mountain Messenger.

NO PART OF THE PACIFIC COAST IGNORED.

The MINING AND SCIENTIFIC PRESS of San Francisco announces the completion of the thirty-sixth year of its uninterrupted and useful existence. It is a high standard publication and everything pertaining to the arts and sciences, the advance of industry and the working of the mines has been noticed at length, and no part of the Pacific coast has been ignored in its pages.

A PARDONABLE BOAST.

The San Francisco MINING AND SCIENTIFIC PRESS has completed its thirty-sixth year of continuous usefulness. This journal is the oldest of its class in the United States, and makes the pardonable boast "that it never took a dollar to put anything in or keep anything out of its reading columns." May it never die.—Cripple Creek, Colorado, Prospector.

A STANDARD PUBLICATION.

The MINING AND SCIENTIFIC PRESS of San Francisco contains an exhaustive article on Cripple Creek from the pen of T. A. Rickard, State Geologist, profusely illustrated with engravings of Cripple Creek, Victor, Anaconda and a number of more prominent mining properties. The fact that so standard a publication as the MINING AND SCIENTIFIC PRESS devotes so much space to Cripple Creek mines is evidence of the firm hold that the Cripple Creek mines have taken upon the mining world.—The Mining Investor.

FIVE AND THREE TO ONE.

Printer's Ink, quoting from the advance sheets of the American Newspaper Directory, which gives the rating of all newspapers of America, reproduces the following in reference to the circulation of the MINING AND SCIENTIFIC PRESS:

Engineering and Mining.
American Newspaper Directory for 1896.

Among the engineering and mining papers in California none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all others, and the publishers of the American Newspaper Directory will guarantee the accuracy of the circulation rating accorded this paper by a reward of $100, payable to the first person who successfully assails it.

The MINING AND SCIENTIFIC PRESS is the oldest mining journal on the American continent, being now in its seventy-third volume. It recently gave an exhaustive review of the Cripple Creek mining district, from which the Eastern and European press have largely quoted.—Denver, Colorado, Republican.

ABLE ARTICLES NOW APPEARING.

We regret not having the space to publish in full the able articles which are now appearing in the columns of the MINING AND SCIENTIFIC PRESS of San Francisco, Cal.—Black Hills Mining Review.

BEST AND MOST RELIABLE.

The MINING AND SCIENTIFIC PRESS of San Francisco is thirty-six years old. And, if such is possible, continues to improve. It is the best and most reliable mining paper published in America and no mining man should be without it.—Calaveras, Cal., Citizen.

THERE SHOULD BE A SECRETARY OF MINES.

The MINING AND SCIENTIFIC PRESS of California is urging the need of a Cabinet Secretary of Mining, and gives numerous reasons for the appointment. The strongest reason is, at present mining decisions are made by the Secretary of the Interior, or some sub who has no interest in mining and is absolutely ignorant of its needs. This department is certainly as important as agriculture, and we believe with the PRESS, there should be a Secretary of Mines, selected from among the many practical and scientific miners of the West.—Denver Mining Record.

AN APPRECIATED DISTINCTION.

The MINING AND SCIENTIFIC PRESS of San Francisco, Cal., has received the bronze medal and diploma awarded to it by unanimous vote of the World's Fair Commissioners. The award was for the high character of that paper, its accuracy and reliability, and must be valued as a fine tribute from competent critics. So far as known it is the only journal thus honored, and the distinction must be appreciated.—Mining Review.

CALIFORNIA CAPITAL INVESTED.

The MINING AND SCIENTIFIC PRESS is authority for the statement that in eight mines in Amador county an expenditure of a million dollars of California capital alone has been arranged for. This statement is made for the purpose of showing that capitalists in California show just as much faith in the business of gold mining within their own State, as manifested by their disposition to invest therein, as do capitalists from the outside.—Amador, Cal., Republican.

Rock in Place.

TO THE EDITOR:—Please allow me to comment upon the subject of the editorial in your issue of July 25th last—"What Is Rock in Place?" I premise by saying that, geologically speaking, no rock can possibly be "out of place" if it be where nature and the work of the elements have put it; and further, the term "rock in place" has no application to placers, nor, in my judgment, is it at all necessary to theorize as to origin when defining terms. As an expert on the stand, I have many times been obliged to answer the question and have invariably replied as follows: It is "any rock, mineralized or unmineralized, in the solid mass of the mountain *other than float.*" I have further historic precedent for this contention.

Mr. Geo. D. Roberts, an old-time mining man, formerly of this city, stated to me that the origin of the phrase was as follows: Late in the fifties and at the very first meeting of the miners of Grass Valley, in this State, to adopt "rules and regulations," the question arose as to what was "locatable." Some maintained that detached masses of mineral might, if valuable, be the subject of location. But it was decided in the negative on the ground that float, technically speaking, *i. e.*, in the sense used by the miners, was not "in place in the solid body of the mountain." Hence my definition.

W. S. KEYES, M. E.,
Vice-Pres't Cal. State Mining Bureau.

San Francisco, July 28, '96.

Gold Deposits in Nicaragua.

TO THE EDITOR:—The American Consul at San Juan del Norte, Thomas O'Hare, has submitted to the State Department at Washington, some interesting statistics relative to the gold deposits of Nicaragua.

Gold was first discovered in Northwestern Nicaragua, in November, 1888, and since that time, rich placers have been found along the Prinzapulca, and some of its upper affluents, some of the very small pockets yielding from $3,000 to $20,000 each; and it is generally estimated that the annual shipments of gold dust from that region since the date named have not averaged not less than $150,000.

The Nicaraguan Government imposes an export tax on gold of 49 cents per ounce, while gold entering Bluefields is also subject to a municipal tax of 12½ cents per ounce. A. F. TENNILLE.

Washington, D. C., July 29, '96.

Tirey L. Ford's Report.

The Executive Committee of the California Miners' Association met at the Union League Club in this city last Monday evening, the 3rd inst., to hear the report of Tirey L. Ford, who was in Washington, D. C., from January 24th to May 23rd, '96, in the interest of certain national legislation desired by the miners of this State.

The report, which consists of about 20,000 words, is an exhaustive account of his mission and its results, with a condensed history of the movement and its progress. Those who have read what has been published in these columns through all the months and years since the inception of the project will sufficiently understand the subject without further repetition.

A brief resume of the matter referred to in Mr. Ford's report is in order:

When he arrived in Washington four measures were found pending in Congress, the passage of which was desired by the California Miners' Association. They were:

1. A bill intended to reduce the penalties provided for in the so-called "Caminetti act," being officially entitled: "A bill to amend an act entitled 'An act to create the California Debris Commission and regulate hydraulic mining in the State of California,' approved March 1, 1893, by amending Section 22 thereof."
2. A bill intended to amend the Federal mining laws, with particular reference to the manner of locating, holding and working mining claims, and the transfer of contests as to the agricultural or mineral character of land from the land offices to the local courts, being officially entitled: "A bill to amend Chapter 6, of Title 32, of the Revised Statutes, relating to mineral lands and mining resources."
3. A bill looking to the segregation of the unpatented mineral lands within the railroad land grants in California, locally known as the "Mineral Lands bill," and officially entitled: "A bill to provide for the examination and classification of certain lands in the State of California."
4. A bill to appropriate money for the construction of works to impound mining debris and thereby to protect the navigable streams of California.

These bills may be referred to in the order above enumerated.

First—The bill to reduce the penalties provided for in the Caminetti act. The California delegation, at a meeting held early in February, '96, disapproved of the above measure, and it was, therefore, not further urged.

Second—The bill intended to amend the Federal mining laws was argued before the House Committee on Mines and Mining by Representatives Barham and Johnson and Mr. Ford, but no definite action was taken by the committee, though the committee seemed favorably disposed toward the measure, particularly with reference to the transfer of contests from the land offices to the local courts, to which latter particular the arguments were most strongly directed.

The pressure of work in connection with the appropriation and the mineral lands bill prevented further systematic effort in behalf of the measure for the amendment of the Federal mining laws, and the latter measure was therefore temporarily neglected. There should be no trouble, however, in securing its passage at the short session beginning next December, for the committee having it in charge is favorably disposed toward it and the California delegation is united in its favor.

The association's representative also laid the above measure before Senator Stewart of Nevada, chairman of the Senate Committee on Mines and Mining, and while he declined to commit himself on the bill generally, he expressed himself favorably in relation to the provision for the transfer of contests from the land offices to the local courts. He also left with Senator Perkins and Congressman Johnson, the authors of the measure in their respective houses, a typewritten statement of the wishes of the miners of California concerning this measure, together with the reasons therefor.

Third.—The mineral lands bill was introduced in the House December 26th, 1895, and referred to the Committee on Public Lands, where the same was pending on the arrival of the association's representative in Washington, January 24th.

Nearly all the members of the California delegation, together with Mr. Ford, appeared before the above committee in behalf of the measure, which became known as the California mineral lands bill. The committee insisted, however, upon modifying the bill in several particulars in order that it might more nearly conform to the provisions of the so-called Idaho-Montana act. To avoid the necessity of amending the bill in the House, and thus causing it to be reprinted, Mr. Bowers was authorized by the committee to report a substitute bill embodying the modifications agreed upon in committee. This was done, the bill was taken up, passed by the House and sent to the Senate, where it was referred to the Senate Committee on Public Lands. Here the opposition, backed by the National Administration, operating through the effective machinery of the Interior Department, made a strong and determined resistance. The Commissioner of the General Land Office addressed a lengthy communication to the Senate committee, setting forth with much vigor his objections to the measure and opposing its enactment into law. This letter had the added weight of the written endorsement of the Secretary of the Interior.

To this letter the association's representative, with the aid of Senator White, drafted a reply, which was signed by Senators Perkins and White, Congressman Bowers and the association's representative. (All this, including the reply, has been heretofore published at length in these columns.)

The bill was finally reported back to the Senate, with amendments, and its passage recommended by a unanimous vote of the committee. The bill, as amended, conformed substantially to the provisions of the so-called Idaho-Montana act, excepting the amendment reported by the committee relating to the classification of large bodies of well-known agricultural land, which latter provision is not contained in the Idaho-Montana act.

The bill was taken up for consideration upon the motion of Senator White and finally passed by the Senate, after having been amended as already noted, the amendments including the so-called Oregon amendment.

The bill was to be returned to the House in the usual manner, when some member of the House Committee on Public Lands, preferably the chairman Mr Lacey, of Iowa, or Mr. Bowers, California's representative upon the committee, was to move a non-concurrence by the House and ask for the appointment of a conference committee. The Senate, anticipating such action on the part of the House, named its conferees at the time of the passage of the bill, Senators DuBois, of Idaho, Pascoe, of Florida, and Pettigrew, of South Dakota, being selected by the Senate to represent that body in the conference committee. The Senators thus selected were all friendly to the measure and would have consented to a recession by the Senate from any of the Senate amendments that might have been deemed prejudicial to the final passage and approval of the measure.

The bill, however, upon its return to the House was referred to the House committee on public lands instead of a committee of conference, thus giving the measure a parliamentary status which Speaker Reed could not be persuaded to view favorably, though strongly urged to do so by the entire California delegation, and earnestly importuned by the Governor, Secretary of State, Attorney-General, State Controller, and other prominent officers and citizens of California. The bill, therefore, remains pending in the House awaiting the concurrence or non-concurrence in the Senate amendments. At the short session commencing in December and ending in March next, the bill can be taken up and sent to the President for his approval, after an agreement between the two Houses upon the pending amendments. In the meantime, it is suggested that the committee on mineral lands might profitably employ such means as it may be able to command to the end that no lands be patented to any of the railroad companies affected by the bill in question prior to the final passage and approval of the same.

HON. TIREY L. FORD.

Fourth.—Col. W. H. H. Benyaurd, Maj. W. H. Heuer and Maj. Thos. H. Handbury, of the Corps of Engineers of the United States Army, constituting what is generally known as the "Biggs Commission," made a report on February 9th, 1891, which was transmitted to the House of Representatives, and, on February 21st, 1891, was referred to the House Committee on Mines and Mining, being officially designated "Executive Document No. 267 (H. R.), Fifty-first Congress, Second Session," in which they dealt with the hydraulic mining question and the means of securing its rehabilitation. Referring to the effect of the suppression of hydraulic mining, the Commission says:

"Since the suppression of hydraulic mining, many claims that were formerly worked by the hydraulic process, so called, are now worked as drift mines, and the owners or operators have not been enjoined. On the large hydraulic mines, however, operations have been suspended, and many costly works incident to the industry have been allowed to go to decay; the mining camps have been deserted and large districts depopulated. The restriction has naturally had an effect upon the yield of gold in this State; to what extent, however, cannot be definitely stated. A reference to the gold production, as given in the table herewith, shows a decline in late years."

It is estimated by the Commissioners that over one hundred millions of dollars were invested in this branch of mining prior to its partial suppression by the courts.

At page 15 of this report, the engineers fall into an error quite common among those not familiar with the legal status of the hydraulic mining industry. They assume the industry to have been interdicted by the courts and its further conduct to be in violation of law. This, of course, was a mistaken view of the law, as will be more clearly understood by a reference to the opinion of the Supreme Court of this State in the case of Yuba county vs. Cloke, rendered in 1889 and reported in volume seventy-nine of the California Supreme Court reports. It was sought to enjoin the sale of water to be used in mining by the hydraulic process, concerning which the Supreme Court says:

"The sale of water was lawful and cannot be enjoined. The business of hydraulic mining, properly conducted, is lawful, and therefore the sale of water for that purpose cannot be enjoined."

Passing over the legal status of the industry, however, the engineers proceed to a discussion of the works necessary to arrest the flow of debris from the mines into the navigable streams, which is recounted at length in the report.

Through united efforts an appropriation item was reported by the Senate Committee on Commerce and, as now incorporated in the river and harbor bill, is as follows:

"For the construction of restraining barriers for the protection of the Sacramento and Feather rivers in California, two hundred and fifty thousand dollars; such restraining barriers to be constructed under the direction of the Secretary of War in accordance with the recommendations of the California Debris Commission, pursuant to the provisions of, and for the purposes set forth in, section twenty-five of the Act of the Congress of the United States, entitled "An Act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March first, eighteen hundred and ninety-three: *Provided*, That the Treasurer of the United States be, and he is hereby, authorized to receive from the State of California, through the Debris Commission of said State, or other officer thereunto duly authorized, any and all sums of money that have been, or may hereafter be, appropriated by said State for the purposes herein set forth. And said sums when so received are hereby appropriated for the purposes above named, to be expended in the manner above provided."

The Committee on Commerce had informally agreed to insert a specific reference to the first an-

nual report of the California Debris Commission, officially designated as "Executive Document No. 16, Fifty-third Congress, Second Session," but, at the request of Messrs. Ford and Johnson, the California delegation agreed to ask the omission of such reference from the final report of the committee. Senator White procured the requested change.

The final result was the passage of the bill as amended by the Senate.

In conclusion Mr. Ford says :

The movement for the rehabilitation of the hydraulic mining industry, begun with the formation of the California Miners' Association in 1892, has steadily advanced in public opinion, and has been favorably considered by the law-making bodies of both State and Nation. The foundation for ultimate success has been securely laid and, with united and determined action upon the part of those most deeply interested, the final result should not be a matter of serious doubt.

It should not be forgotten, however, that the work is but fairly begun, and that much remains to be accomplished. An unfortunate antagonism still exists in certain quarters, though, happily, confined to narrow and ever contracting limits. Our National Congress is slow to recognize the importance of the work, and is still in doubt as to the limits of its jurisdiction in the premises. Added to all this the miners of California are themselves not wholly in accord as to the best means of accomplishing the desired results.

The first matter that should engage the serious attention of the California Miners' Association is that of agreeing upon a definite line of policy to be pursued by the friends of the hydraulic mining industry in their efforts to restore it to its original station among the industries of California. Either the policy outlined by the Biggs Commission and amplified by the Caminetti Act should continue to guide the association in the future as it has in the past, or a new policy should be definitely agreed upon that would bring harmony and increased energy to the cause. As one who has watched the cause through its various stages, and has given to it a considerable degree of attention, your representative begs leave to suggest that it would be well to carefully consider any proposed change before departing from that policy which has hitherto guided the association, and to which Congress is in a large measure committed.

With a definite policy agreed upon, every energy should be directed to a proper presentation of our case at Washington, whence must come the final relief to which the miners of California are so clearly entitled.

Above all, absolute candor and fairness must characterize whatever course it shall be deemed most advisable to pursue. No advocate of the miners' cause, however ardent and enthusiastic, desires success at the disadvantage of any other interest, and no true friend of the cause will seek to gain a temporary advantage that must in the end but postpone the day of ultimate success.

The policy laid down in the reports of Col. Mendell and the engineers comprising the Biggs Commission, and thus far steadily adhered to by the California Miners' Association, would seem to afford a reasonable ground upon which all interests could safely stand. Such a policy carried into practical operation would cause such debris as could be safely stored behind properly constructed barriers to be permanently lodged in the canyons and foothills of the Sierras, while an improved river system, relieved in part of its ancient burden, would, by the aid of engineering skill, be made to carry the increasing commerce of the State without menace to the lands through which the rivers flow. These conditions once established, the rehabilitation of the hydraulic mining industry would speedily and easily follow, and the miner and the farmer would alike feel that their days of anxiety had permanently gone by.

San Francisco, June 30th, 1896.

The report was adopted and ordered printed.

Gold Milling at Grass Valley, Cal.*

Written by T. A. RICKARD, State Geologist of Colorado.

Mr. Abadie, in his excellent description of the work at the North Star mill, did not concern himself with the methods of his neighbors at Grass Valley. This was doubtless largely due to the fact that the mill of which he had charge was generally acknowledged as representative of the practice of the district.

The following additional matter, based on visits to this district made in December, 1886, May, 1891, and July, 1893, may, however, render the description of the milling practice more complete.

The first mill erected in California was not built at Grass Valley in 1850, as stated by Mr. Abadie. Mariposa county claims that distinction, and accords it to a mill of eight stamps, each in its own separate mortar, erected on the Mariposa estate late in the summer of 1850. It was not till the following January that a mill was erected on the west bank of Wolf creek, nearly opposite the site of the present Empire mill at Grass Valley.

Mr. Abadie's drawings and photographs very completely illustrate the position and interior arrangement of the North Star mill. The drawings are particularly valuable. The most notable change made in the North Star mill since my first visit in 1886 has been the new arrangement of the amalgamating tables. When going through the mill for the first time, I noticed the inadequacy of the amalgamating surface and the uselessness of the narrow sluice plates. Since then the shaking-tables have been replaced, in the case of the last two batteries added to the original thirty stamps, by new wide plates which are nearly 16 feet long. The old short apron and narrow sluice plate have been thrown out. The other six batteries were, at the time of my last visit, and, it would appear, up to the time of Mr. Abadie's description of the mill, still provided with the primitive apparatus which was first criticized by me nine years ago.

This is the great blemish of the North Star plant, which has followed in this respect the design of the typical Californian mill, whose narrow sluice-plates are a remnant of the apparatus originally borrowed by the quartz miner from the placer digger.

In order to discuss this question, a detailed description of the passage of the pulp on its discharge from the mortar will be necessary. The screen frame, which is 4 feet 4 inches long and 18 inches wide, has four partitions dividing the issue into five portions. Each division of the screen surface is 9 inches wide and 12¾ inches high. While this construction strengthens the screen, it robs it of 1 square foot of discharging area, and is not therefore to be commended. The pulp then drops 6 inches and strikes the battery plate, which is 4 feet 2 inches wide and 18 inches deep. It covers an iron apron which is bolted to the mortar.

Then there succeeds a trough from which the pulp passes through a distributor, consisting of a vertical iron partition pierced by twenty ¾-inch holes. Then follows a drop of 3½ inches to the apron plate. The latter is 4 feet 5 inches wide for 2½ feet, and then becomes narrowed for the remaining 2 feet, finishing with a width of 22 inches. Then come the sluice plates, 22 inches wide and 12 feet long. They had a slope of 1-inch per foot at the time of my visit, but according to Mr. Abadie, the gradient is usually greater, viz., 1¼ inches. The aprons are given 1½ inches per foot.

Then come the copper lined shaking tables. The new plates are 16 feet long, of which the upper portion, of 2½ feet, is 53 inches wide and represents the former apron, and the remainder is 46 inches wide, representing an enlargement of the sluices.

Mr. Abadie says that these new plates "cannot be too highly recommended," which is quite true when we contrast them with the old arrangement; but one may be permitted to ask, Why this narrowing of the plate from 53 to 46 inches? I take the liberty of emphasizing this matter because it has for many years seemed to me that the California stamp mill, otherwise the best machine of its kind yet evolved by the ingenuity of man, suffers seriously from an unsuitable arrangement of the amalgamating surface. In tracing the evolution of the apparatus of the stamp mill it will be found that the first gold-saving methods were modeled after placer mining practice, and that in the term "sluice plate" lingers the evidence of the transference of the sluice box from the gulch into the mill. The arrangement of 4 feet of plate as wide as the mortar, followed by 10 or 12 feet of plate somewhat under 1 foot wide, was almost universal in California a few years ago, one mill copying another apparently without inquiring into the object of the arrangement. At the North Star an examination of the sluices showed the edges of copper plate to be abraded or scoured by the swift passage of the pulp.

The philosophy of the sluice plate is not evident. The battery and apron have caught the coarser gold —that which it is easiest to arrest—and the object is to prevent the escape of particles which, because they were fine and difficult to catch, have not been stopped. Hence, the sluice plate is put in, but it is more a launder for the convenient conveyance of the pulp to the vanners than a gold-saving device. How can we expect to catch gold which would not be arrested on a wide plate, by passing it over a very narrow one? The quantity of water and crushed ore is still the same, but it is crowded into a much lessened space, the speed of its passage is increased, and the depth of its flow augmented. In some mills the grade of the sluice plate is actually greater than that of the apron.

Therefore the ordinary practice should be reversed, the apron should be succeeded by a wider rather than a narrower plate, additional facilities for the catching of the gold should be given by spreading the pulp so that every opportunity is afforded for its contact with the amalgamated surface of the plate.

The necessity for a uniform depth of battery discharge is hardly appreciated at Grass Valley. At the North Star no serious attempt was made to regulate it, so that it used to vary from 2 to 6 inches. Since my last visit it has become the practice to introduce cast-iron plates 2 inches thick underneath the dies. They have lessened the difference between the minimum and maximum depth of discharge, according to Mr. Abadie, to 2 inches. Although his account does not state the fact, yet the context would indicate that these plates are introduced after the dies have been worn down, thereby restoring the height of the issue. At the Empire old dies used to be placed underneath as the dies is use were worn down, and this was found preferable to employing iron plates for false bottoms (as at the North Star), because the latter broke so often. If they are made to fit snugly, this breakage should be no great detriment, as the pieces will remain in place. In addition to these methods, the Empire mill uses the device of fixing wooden cleats to the bottom of the screen outside. The sand banks up inside the mortar, and protects the unused strip of screen until such time as, the dies having worn down, the cleats are removed and the issue lowered. At another mill, the W. Y. O. D. ("Work Your Own Diggings"), the dies are discarded before they have worn down deeply. The remnant is sold to the local foundry, and helps to pay for new dies. This is wise. The consumption of a few pounds of iron is a very small matter compared to the importance of maintaining the conditions best adapted to good work. When the depth of discharge varies between wide limits, the operation of the mill must be irregular. The minimum and the maximum depths cannot be equally favorable to the particular conditions required, and an effort should be made to find the exact depth best adapted to the treatment of the ores of the special mine, and that figure should then be maintained as far as is practicable.

In the matter of screens, the Grass Valley mills have, as it seems to me, taken a retrograde step The general adoption of punched tinplate in place of wire cloth is defended on the ground of economy. Thus, Mr. Abadie says that "the life of a tin screen is about thirty days; the cost, one-fourth that of wire screens." As a rule, at Grass Valley, the brass wire screens cost $1.55 apiece, while the tinplate costs 55 cents per screen, the former giving a service of twenty-five days, the latter fourteen or fifteen days. Steel-wire cloth was discarded because that which was used in this district had the defect of a shifting of the horizontal wires. The introduction of tinplate into the Californian mills dates several years back. I first saw it in use at the Utica mill, Angel's Camp, in 1886. In 1893 the Idaho was the only mill in Grass Valley which was not employing tinplate in preference to wire cloth. It is the usual custom to burn off the tin upon the blacksmith's forge, with the idea that the iron plate becomes annealed and toughened. Since tin amalgamates, its removal prevents the adherence of mercury to the screens.

The cost of screens per ton of ore varies from ¾ to 1 cent per ton, an item of expense which is trifling when compared to the importance of getting a screen which will properly size the pulp and aid in maintaining the conditions most favorable to good amalgamation. No one at Grass Valley had, as far as I could learn, made any careful experiments to determine the action upon the pulp of the use of the two varities of screen. One would naturally expect a more free issue and a more uniform crushing when using wire cloth in place of punched plate, because the former has a discharge area approximately one-half of its surface, while the latter, having apertures of the same size, has less of them per square inch.

The milling practice of the Grass Valley district has undergone important changes during the past ten years. The introduction of an inside amalgamating plate—first done at the North Star in 1888—marked an important departure from the extreme type of fast-crushing California battery. The tendency to increase the percentage of inside amalgamation by deepening the discharge and inserting a chuck-block (which also carries an amalgamating plate) is a notable feature. Thus from a rapid pulverizer the California mill has been made an improved amalgamator. This older, very shallow-drop mill, unable to use a plate inside the mortar, and relying solely on the outside tables, has become rare on the Pacific slope. It has become a recognized fact that rapid crushing will not compensate for poor amalgamation; that the sooner we catch our gold the better; and that the best feature of the stamp mill, as compared to other pulverizers, is its capability to combine the crushing and amalgamating apparatus in one machine.

At the North Star and W. Y. O. D. mills nearly twice as much amalgam is obtained from the inside as from the outside of the mortar; while at the Empire the inside extraction is from 50 to 85 per cent of the total saving.

Heavy silver plating is recommended nowadays. The North Star plates carry one ounce of silver per square foot, those of the Empire have 2½ ounces, while at the W. Y. O. D., the newest plant, the amount has been increased to five ounces. One cannot remember too often that it is amalgam that catches gold, and that a good coating of gold amalgam is better than all the nostrums in creation. In starting a new mill or introducing new plates a good coating of silver helps to get the tables into working order in a short time, the silver being gradually replaced by gold. There is no economy in poorly plated tables or in short, narrow ones. No mill I have ever seen had too much amalgamating surface; many of them had too little. The value absorbed by the plates is an asset of the best kind; and there is no plate placed in a mill but will absorb some gold and be worth more when it is worn out and discarded than when it was first put in place. The following fact will be of interest in this connection: The old plates of 60-stamp mill of the Montana Co., Ltd., at Marysville, Montana, after 4½ years' steady work, 1887-1891, were scraped and melted down. (This was, of course, after they had undergone the usual periodical clean-up.) The twelve plates, each 54 by 96 inches, yielded $90,000. One plate gave as much as $8000. Even the small vanner plates, 16 by 48 inches, yielded $500 each.

The importance of the careful sampling of the tailings as a check upon the mill work is better appreciated at Grass Valley than in any other locality I have visited. At the Empire mill there is an automatic sampler, invented by Mr. Starr, the former superintendent, which does excellent service. The results indicate a saving of from 85 to 87 per cent, which is fairly representative of the district.

*Trans. A. I. Mining Engineers.

Glossary of Mining Terms.

(Continued from L. W. Tatum's Compilation.)

Gad—A small pointed wedge.
Galena—Lead ore; sulphur and lead.
Gallery—A level or drift; applied chiefly to collieries. A level from which the ore has been stoped.
Gangue—The substance surrounding and associated with the ore.
Gash Vein—A vein wide at the top and closing at a short depth.
Gallows Frame—The frame supporting a pulley over which the hoisting rope passes to the engine.
Gateway — A gangway having ventilating doors.
Geode—A cavity studded around with crystals or mineral matter; a rounded stone containing such a cavity.
Glance—A term applied to the sulphides of some metals.
Gneiss—Metamorphic rock, resembling granite.
Gossan—The decomposed matter on or in an ore deposit, composed of iron oxide.
Gouge—A clayey streak found next to a fissure vein.
Grass Roots—A term used where a working is started from, or worked up to, the surface.
Granite—A plutonic crystalline rock composed of feldspar, quartz and mica.
Gray Copper—Tetrahedrite. An ore containing copper 15 to 45 per cent, combined with iron, zinc, silver, mercury, arsenic and antimony. It varies in color, hardness and specific gravity.
Grub Stake—Provisioning a prospector on a bargain to share his discoveries.
Grizzly—A grating used to sort ore according to size.
Guide—The timbers nailed to the timbers of a shaft for the purpose of guiding the cage.
Gunboat—A skip; a self-dumping box used in slopes.
Hackly—Having a surface of rough points when broken.
Hade—The slope of a vein, usually applied to a fault.
Hanging Wall—The laying of rock, or wall, immediately over a lode.
Heading—Same as Breast; a vein of ore above the drift.
Headings—In placer mining, the mass of gravel above the head of the sluice.
Heave—The horizontal dislocation of one lode by another.
High Explosives—Those of greater detonating force than black powder.
Hitch—A hole cut in the wall to hold timbers.
Horn—An ox or buffalo horn, halved and used as a pan.
Horse—A mass of country rock between the enclosing walls of a vein. To constitute a horse, it is necessary that the walls converge about the mass below and at both ends, but the greatest known horses do not converge overhead. "The two walls coming to the surface are in some instances 1000 feet apart."
Hungry—Barren.
Hydraulic Cement—Sets under water. Made from limestone, containing alumina, magnesia and silica.
Hydraulic Mining—Mining placer gold with a stream of water under pressure.
Hydraulicking — Washing down a bank of earth or gravel with pipes conveying water under great pressure.
Igneous—Applied to all rocks cooled from a state of fusion.
Impregnation—Metallic deposits having undefined limits and form.
Incline Drift—An inclined passageway under ground.
Infiltration—The theory that vein filling was introduced as mineral water.
Injection—The theory that vein filling was introduced by an igneous fluid and solidified.
In Place—A vein, or ore, in its original position.
In Take—The entry which conducts the incoming air-current to the mine. It is synonymous with downcast.
In Situ—In fixed place. Original position.
Iron Hat—The out-crop of a lode, it being usually colored by the decomposition of the iron.
Jamb—Any thick rock which cuts off the vein.
Jig—A machine for concentrating ore by means of water.
Jigging—A method of sorting ore by shaking in a sieve in water.
Jump—To take forcible possession of a claim. (2) To relocate abandoned property.
Lagging—Timbers over and upon the sides of a drift.
Laundry Box—The box at the surface receiving the water pumped up from below.
Lean—Poor in metal.
Ledge or Lead—Mineral ores or gangue within fissure or contact veins.
Length—A certain portion of the vein when taken on a horizontal line.
Level—A horizontal passage or drift into a mine from a shaft.
Lift—All the mine workings connected with, opened from, and mined out at one level; also the length of pump-pipe between stations.
Litharge—An oxide of lead used in assaying.
Lithology—The study of rocks. Geology applies to formations of the earth.
Little Giant—A jointed iron nozzle used in hydraulic mining.
Live Quartz—A variety of quartz usually associated with mineral.
Loam—A mixture of sand and clay.
Location—The successive acts by which a claim is appropriated. (2) The claim itself.
Lode—Same as ledge or lead.
Magma—The liquid matter within the earth, the source of igneous rocks.
Massive—Not stratified. Without cleavage.
Matte—A mass, chiefly of metallic sulphides, obtained in the fusion of ores.
Measures—A term embracing the strata of a geological series.
Metamorphic—Changed in form and structure.
Mica—One of the constituents of granite. When separately crystalized, is found in clear laminated plates. Found in the lode as well as the matrix of the lode.
Mill Run—A test of the value of a given quantity of ore.
Mine—An excavation in the earth from which mineral substances are dug.
Miners' Right—The license to locate, used in Australia.
Mining—In its broad sense embraces all that is concerned with the production of minerals and their complete utilization.
Mispickel—Iron pyrite, containing arsenic.
Mortar—A receptacle for ore beneath the stamps of a stamp mill.
Moyle—A drill or short bar sharpened to a point, used in cutting hitches and in broaching. (Also Moil.)
Muffle—An oxidizing furnace.
Native — As applied in mineralogy, means metal found pure, or refined by nature.
Nitro—A corrupted abbreviation for nitroglycerine or dynamite.
Noble Metals — Gold, silver, mercury and platinum.
Nodule—A rounded mass of irregular shape.
Nugget—Any lump of native metal.
Operator—One who works a mine either as owner or lessee.
Open Cut—A surface working without a covering.
Ores—Compound of metals with oxygen, sulphur, etc.
Ore—The mechanical or chemical compounds of the metals with baser substances. The conventional designations in the ore market are: Dry Ore, an ore which does not contain any lead, or less than 5 per cent; Milling Ore, a dry ore that can be amalgamated or treated by leaching or other processes; usually these ores are low-grades, free, or nearly so, from base metals; Shipping Ore, such as is better adapted to smelting than any local treatment; any ore of greater value when broken less the cost of freight and treatment; Refractory Ore, an ore containing in quantities zinc, arsenic, antimony or other base metals, which prevent economical treatment by usual and available processes.
Ore Reserves—The ore body where exposed ready for stoping.
Ore Shute—A large and unusually rich aggregation of mineral in a vein. Distinguished from pay streak in that it is a more or less vertical zone or chimney of rich vein matter extending from wall to wall, and having a definite width laterally.
Ounce—Used to designate the ounces of pure gold or silver to the ton of ore.
Outcrop—The portion of a vein showing at the surface.
Outlier—Any portion of a group of rocks, lying in a detached position, or out from the main body.
Outlet—An exit passage from the mine.
Output—The product of a mine.
Oxide—A compound of oxygen with other elements.
Oxidation—A chemical union with oxygen.
Ore Zone—A large deposit of ores or minerals in place.
Pan—A hard stratum of earth; a broad, shallow vessel used for washing auriferous gravel.
Panning—The act of separating gold from gangue or gravel by washing.
Parting—A joint in the rock, or a crevice in a seam, filled with clay or slate; a thin stratum or layer which separates two formations. Also called a Selvage.
Patch—A small placer claim.
Patio—A yard or court; the space where ore is mixed and amalgamated by tread of horses. (Spanish.)
Patio Process—The Mexican method of amalgamation of silver ores.
Pay—Profitable ore.
Pay Streak—The richest streak in the vein.
Pay Rock—The lode material in which the mineral or pay is found.
Phonolite—A greyish, compact, felspathic rock yielding a metallic sound after the hammer; clinkstone.
Phosphates—Prehistoric acid combinations.
Pinch—Contraction of the vein.
Pipe—An elongated body of mineral, generally in a horizontal plane.
Pitch—The slope or dip of a vein.
Placer—A deposit of gold or other mineral found in particles in alluvium or diluvium.
Plat—A small chamber on the side or sole of a level where it intersects a shaft, made to facilitate dumping. Where it is cut in the sole it is called a trip-plat. (Cor.) A platform for sorting ore.
Pocket—A rich spot in a vein or deposit.
Pockety—A term applied to a mine where the pay ore occurs in small detached bodies with intervals of poor ore or barren material. The word implies a slur on the mine.
Poling—The process of timbering by the use of poles, for timbering in soft ground.
Poppet, also Puppet—A pulley frame or the head gear over a shaft. A valve which lifts bodily from its seat instead of being hinged.
Porphyry—A general term including such plutonic rocks as exhibit well formed crystals, usually of feldspar, in a finely granular or compact base of the same. (Ger.)
Porphyritic Granite.—A base of granite containing prominent crystals of feldspar.
Power Drill—A rock drill employing steam, air, or electricity as a motor.
Prill—A good sized piece of pure ore.
Prop—A piece of timber or metal placed normally to the roof or wall for its support.
Prospect—The name given to underground workings, the value of which has not yet been made manifest. A prospect is to a mine what mineral is to ore.
Prospecting—Searching for mineral veins.
Pulp—Finely pulverized ore.
Pulverize—To reduce to powder or dust.
Pumice—A light, porous lava.
Pyrites—(White) A sulphide of iron. (Yellow) A sulphide of copper. A bright, crystalized, metallic-looking and very common gold-bearing ore, usually low grade and spoken of in common parlance as the "Iron." (Ger.)

Scientific Progress.

Compressed Air for Street Cars.

The use of compressed air as a street railway car motor is receiving present experimental trial in Chicago, Ill. There are two engines, each cylinder is seven inches in diameter, fourteen-inch stroke, one on each side beneath the car floor. The wheels are twenty-six inches in diameter, connected outside; the connecting bar is attached to the crosshead from above. The compressed air is contained in sixteen steel reservoirs, tubes of nine inches in diameter with an aggregate capacity of five cubic feet each. They are from sixteen to twenty feet long, are hung underneath the body of the car, two being inside under the seats. There is a throttle lever, reversing lever and air brake valve in compact form at each end of the car. Fully equipped with the motor the car weighs 18,000 pounds. Under the middle of the car is a cylinder seven feet long, eighteen inches in diameter, half full of water. In preparing a car for service it is run alongside storage tanks and the reservoirs charged through flexible connections. At the same time a steam pipe is connected with the water cylinder under the car, and steam forced through the water until the temperature is about 300 degrees. The motorman then opens the throttle and air from the reservoir is passed through a pressure regulator, where it is reduced to working pressure of about 150 pounds. From the regulator it is led by pipes to the hot tank, where it is forced through the water to give it warmth and moisture. It is a well-known fact that where a compressed gas is permitted to expand quickly heat is so rapidly absorbed from the surrounding air that a very low temperature is produced. In engineering operations where compressed air is used the pipes conveying the expanded air are covered with a thick frost. It is to prevent the freezing up of the motor—a difficulty that has existed in previous machines—that the air is passed through the heater. From the heater it goes to the engines, where it operates precisely as steam would do. The exhaust is noiseless. One charging of the reservoirs will run an ordinary car seventeen miles, while the pressure in the reservoirs will have been reduced from 2,000 to 140, and the temperature of the heater from 300 degrees to 180 degrees. In practice storage reservoirs and steam heaters are located at points along the line where the cars may be recharged as necessary.

ASTRONOMERS are already preparing for the next great shower of Leonids, or November meteors. These showers, which are among the most impressive phenomena exhibited by nature to man, are due to the crossing of the earth's path of a stream of minute bodies—probably pebbles not exceeding an ounce or two in weight, and spaced a mile or two apart in the densest portion of the swarm—which complete a revolution in their orbit in about 33¼ years. The meteors cross the earth's orbit at the point reached by our planet on the 12th or 13th of November, being next due at the place where the orbits intersect in November, 1899, or November, 1900. As the stream is immensely long, the earth will probably pass through the dense part of it on both years, and may encounter scattered members of the group on one or two years preceding and following those named. The thickness of the stream seems to be about 100,000 miles, but the earth, passing obliquely through it, is exposed to the meteoric downpour for about four or five hours. The meteors are traveling in the wake of Tempel's comet, which Leverrier thought was brought into our system in the year of 126 of our era. That this system is comparatively new is proven by the fact that it extends over not more than a tenth of its orbit, while the August meteors, which appear every year, have become quite evenly scattered over their entire orbit. Among other suggestions for studying the Leonids, Dr. Johnstone Stoney recommends attempts to photograph the swarm, both at the time when the earth is passing through it and while it is still in outer space. The swarm will be invisible to the eye, except as the particles are burned in our atmosphere, but may impress a long-exposed sensitive plate. Data that may serve in tracing a very remarkable past history may be gained also by noting the time when the earth encounters the most advanced of the meteors—possibly this year—and the hours when the showers seem to begin to reach their height, and to pass off. Any person who, about the middle of next November, witnesses a display of shooting stars from the constellation of Leo may aid astronomy by recording exactly what he sees.

WHEN there have been explosions in mines, due to the presence of inflammable gases, there result other gases which exert an unwholesome, if not positively fatal, influence on human life. In one certain instance, mentioned in a recent scientific report, fifty-two deaths resulted in this indirect way, and five directly, from the explosion. Hitherto, the after-damp, or gas produced by the ignition of fire-damp in mines, has been believed to consist essentially of corbon dioxide, or a combination of carbon and oxygen in the proportion of one atom of the former to two of the latter. But in the case just mentioned, carbon monoxide (which contains only half as much oxygen) played a conspicuous part. The lips, skin and mucous membrane, through which the color of the blood was visible, were of a much brighter red than is observed when death results from other causes. It was suspected that this was due to the presence of carbon monoxide, and subsequent tests verified the suspicion. The coloring matter of the blood contained no less than 79 per cent of this gas. It was thus ascertained for the first time just what percentage of saturation with this particular gas produced death. The report which contains this information calls fresh attention to the fact that the flame of a miner's lamp, which gives indications of the presence of carbon dioxide, does not reveal the existence of carbon monoxide.

THE curious colors of aluminum alloys have been investigated by Dr. Charles Margot. The alloys of white metals are usually white, but an alloy of 78 parts of gold and 22 of aluminum is brilliant purple, and one of 72 parts of platinum and 28 of aluminum is bright yellow. In these cases there seems to be true chemical combination. The structure is crystalline, and the alloys fall to powder when lightly struck, this property making them unfit for use in coinage and for other purposes.

AT the recent meeting of the Royal Society in London, a pendulum instrument was exhibited, intended to record the slightest tilts and pulsations of the crust of the earth. It was asserted that this instrument would render observable a tilt of less than one three-hundredth of a second of arc. In other words, if a plane surface were tipped up only so little that the rise would amount to a single inch in a thousand miles, the instrument would reveal the tilting.

AN aluminum quadrant has been devised to measure the actinic power of the Rontgen rays. The aluminum is arranged in concentric layers ranging from one to ten millimeters in thickness. Measurements are taken by holding the quadrant between an excited Crookes tube and a phosphorescent screen or a sensitized plate.

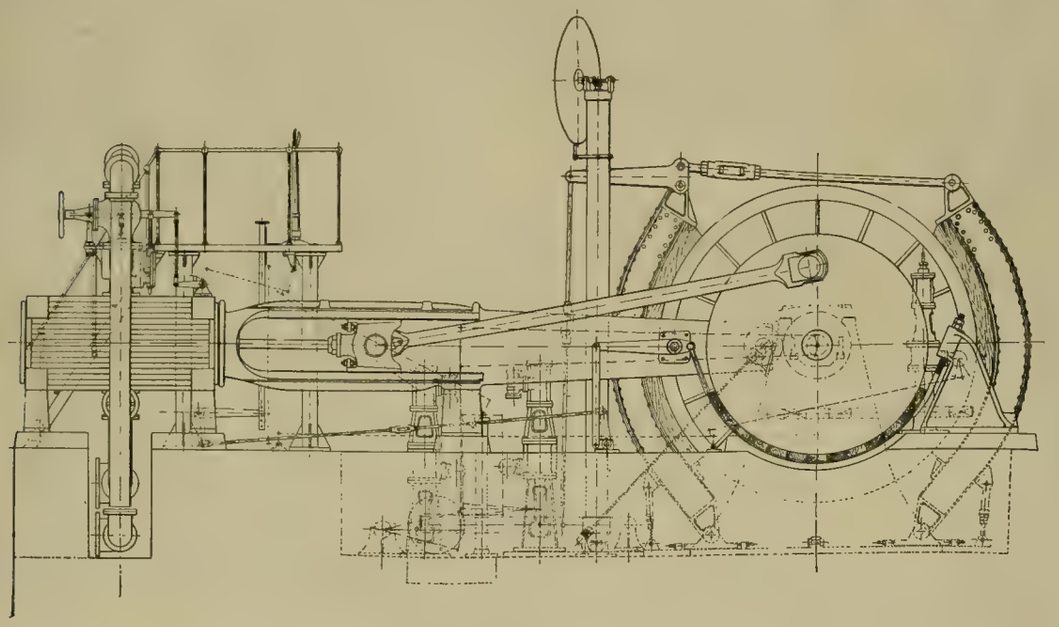
Mechanical Progress.

The Power Plant at the Corral Hollow Coal Mines.

Written for the MINING AND SCIENTIFIC PRESS by E. A. RIX, M. E.

The Rix Compressed Air Machinery Co., of this city, have for the past six months been engaged in installing a 1000 H. P. steam plant for the coal mines of the San Francisco and San Joaquin Coal Co., situated at Corral Hollow. The steam is furnished by six 72x16 standard horizontal tubular boilers, operated under a forced draught. The forced draught is supplied by two steam actuated Sturtevant fans, working through a 26-inch brick conduit. All the clinkers and ashes are removed from the furnace by means of a continuous system of conveyers, taken into independent bunkers and then carried away from the mine by cars.

The steam is carried through 11-inch tubing, about 500 feet, to the direct connected hoist, which is illustrated in this article. This hoist is of the Corliss type, direct connected, its engines having 20-inch diameter cylinders by 60-inch stroke. There are two reels, each 7 feet in diameter, carrying about 2000 feet of 1⅛-inch patent steel cable.



DIRECT CONNECTED HOIST AT THE CORRAL HOLLOW COAL MINES.

All the clutches, links, brakes, etc., are operated by steam cylinders with cataracts, which are under perfect control of the man who stands upon the elevated platform.

This hoist is heavy in design, weighing a little over 100 tons, and is calculated to hoist a load of 20,000 pounds 1500 feet per minute.

The cages connected to the cable of this hoist are rather unique affairs, being really conveyers rather than cages. The cage is about 30 feet long and runs on an independent outside track in the shaft, which is on an incline of 56°.

Within the cage track is a track upon which run the coal cars. This system of tracks and the relation of the cars to the cage is such that the cars are drawn along the track and discharged at the surface automatically, without stopping the cage. This is a unique system and will give a maximum hoisting capacity to the plant. There is practically no water at the mine fit for use in the boilers, and therefore all the water used on the different engines is condensed in a surface condensing apparatus of a unique pattern. The condenser is not used for vacuum purposes at all, but merely for condensing the feed water. The water which comes from the mine is always available, and is very heavily charged with different minerals, which corrode and scale any kind of pipe very rapidly. The condenser is therefore constructed in such a manner that any tube of the condenser can be cleaned off while the condenser is in operation. It is practically a large, flat tray, about 100 feet long and 40 feet wide, covered with a gridiron of copper pipes, so that it is possible for a man to sweep off these pipes with a metal brush, at any time, thus keeping them clean and in good condition for condensing.

The engines for the hoist were manufactured by the St. Louis Iron and Machine Works, of St. Louis, Mo., and the balance of the work on the hoist was built by the Fulton Engineering and Shipbuilding Works, of San Francisco, for and under the supervision of the Rix Compressed Air Machinery Co.

San Francisco, July 31, '96.

A New Boat.

Mr. Apostoloff, a Russian electrical engineer now in England, claims to have made a boat that will transport people from England to America in twenty-eight hours. It is made of toughened steel, shaped like a fish, the tail comprising the rudder. Round the body of this cigar-shaped construction a helix completes twenty-eight turns. Within this outer casing there is another shell, so placed and weighted that it remains perfectly stationary while the two-thirds of the exterior form to which the helix is fixed revolves with great rapidity. Thus it will be seen that the ship screws instead of pushes its way through the water. A shaft runs longitudinally through the center of the boat, fixed at either end to those parts of the outer casting which do not revolve, and upon this rests the inner portion, including both the passenger accommodation and the machinery used in propelling the boat. The Plongeur, as it is called, is capable of either floating on the water, or remaining below the level of the sea for thirty-eight hours without returning to the surface. The inventor says his boat will travel under water at the rate of 120 knots an hour, and will cost £20,000. He has been maturing plans for the last seven years. In the naval warfare of the future the boat is likely to play an active part.

Casting German Silver.

To obtain solid casting without blisters it is necessary to use none but first-class material and to observe the greatest economy in smelting. The latter is generally accomplished in the following manner: First a layer of small pieces of copper is put into the crucible, then a layer of zinc, nickel and finally, pulverized coal. The final covering is formed by a layer of copper and a heavy layer of coal. About one-half of the nickel and zinc to be melted should be retained and added in small portions after the mass has become liquid. The quicker the melting the less danger of absorption of oxygen and the formation of blisters is incurred. The metal retained should be added to the liquid material under continuous stirring with a wooden stick. In conclusion, says the *American Manufacturer*, some more coal is added and after it is burned and the ash has collected on top the mass is ready for casting, which should be accomplished at the proper temperature, neither too hot nor too cold. Molds and cores should be perfectly dry and none but sharp crystalline sand be used.

If it be true of fine wire, as stated in *Iron* and often set forth in print, then gold is by no means the highest metallic standard of industrial value. At a meeting of the South Staffordshire Institute of Iron and Steel Works Managers, Thomas Morris pointed out that the Warrington wire manufacturer who presented him with various specimens of workmanship in that line got $4.32 per pound or $8600 per ton for the article of drawn wire exhibited and so largely used in the construction of pianos and other musical and mechanical instruments. For pinion wire he got $2.16 per pound or $4,320 per ton. It took 754 hair springs to weigh an ounce of 437½ grains; it took 27,000,000 of them to weigh a ton, and taking one to be worth a cent and a half, the value of a ton of these apparently "cheap little things" runs up to over $400,000. The barbed instruments used by dentists for extracting nerves from the teeth were even more expensive, representing a rate of $2,150,000 per ton. A mile length of No. 19 size wire weighed only 21 pounds, and many of the ingots were 12 to 14 hundredweight each, and, after allowing for all the waste, only 50 miles of wire could be gotten from one ingot.

THE abandonment of profit sharing by so many firms in the United States leads *The National Labor Tribune* of Pittsburg to say: "The workmen ask a share in the business that is to yield them the fruits of prosperity without imposing any of the burdens of adversity. They would share gain but not loss. It is here that profit sharing fails. The system cannot be natural because it is not just. Like the handle on a jug, the benefit is all on one side. If the workmen consider themselves entitled to a financial interest in the firm they should be prepared to pay their pro rata assessment of loss as well as pocket their share of the gain The sliding scale system of wages, which the Amalgamated Association of Iron and Steel Workers favor, is recommended as a better one than the ordinary profit-sharing plan."

Electrical Progress.

Useful Electrical Force.

Electricity, light, heat and chemical action are all in essence motion; electricity is the most desirable of all of them, because it can most readily and fully become the source of issue of any other, says *Appleton*. The pre-eminent sensitiveness of electrical apparatus makes it a surpassing means of measuring minute portions of space or time, of light, heat, chemical activity or mechanical motion. Hence, a brood of tell-tales of widely contrasted purpose.

Selenium, a metalloid of the same lineage as sulphur and betraying its descent by a striking family resemblance, has the curious property of transmitting electricity more freely in light than in darkness; a stick of selenium, therefore, is the pivot of a device to give warning when extinction befalls a lamp charged with important duty. In thermometers a circuit broken or completed acts as a fire signal, or on shipboard heralds the approach of an iceberg.

Electric fingers sound a gong when the water recedes below the safety level in a steam boiler, or report an attempted breach of bolt or bar by the burglar's jimmy. Each of these warnings can be registered at a distance, so that in case of neglect by an attendant there can be no disputing the fact. Now, if an electric alarm can summon a servant to duty, why may not the inventor go further and so add to his device that it shall, of its own motion, do what needs to be done?

Accordingly, we find furnaces fitted up with electrical control, so that the draft is opened or fuel added when the temperature falls too low, or the reverse when the flame is too fierce. When the fuel is gas this stoking leaves nothing to be desired. New mechanism of this kind is constantly being conceived. The inventor who began by conferring electric nerves on muscles of brass and iron, has, thanks to electricity, gone the length of combining his wires and magnets into something very like a conscious and responsive brain. His intelligence culminates in duplicating itself.

In Kern Co., Cal.

Fifteen miles northeast of Bakersfield, Kern Co., Cal., the rapids of the Kern river furnish suitable force for the generation of electric power. The Power Development Co. of this city are now pushing a work that will cost $300,000 and furnish power for mining and other industries in that locality. In connection with what this paper has previously published concerning the work, it is worthy of present note that so far all the preliminary calculations and surveys have been found satisfactory and the actual work is rapidly progressing.

About two miles up the canyon from the site of the power house begins the flume that will carry the water. It is 8x6 feet, built on 4x6-inch sills and uprights, made of inch lumber, covered with felt and asphalt, and lined with half-inch redwood. It is 8574¾ feet long, devoid of angles, built on a grade of 6 feet to the mile, with 23 per cent curvature. It is calculated to carry 280 cubic feet of water per second, to be delivered at the power house to a steel pipe 540 feet long, 5½ feet diameter. The H. P. to be developed is figured at 7500.

A New Telephone System.

The new switchboard of the telephone exchange at Worcester, Mass., is the first multiple ever constructed employing automatic signals. An operator is enabled to complete the work of making a connection for a subscriber whose call she answers, and the signals are so arranged that she has constant knowledge of the several connections under her charge. It is not necessary for the operator to listen into the line to determine whether a subscriber has answered his bell nor to find out

whether or not he has finished talking, for all this and more is shown her by the lamp signals placed upon the keyboard. When the subscriber removes his telephone from the hook, it lights a lamp upon the switchboard, which indicates that the operator must place a plug in a jack close beside a lighted lamp. The placing of this plug extinguishes the line lamp, and, on receiving the number wanted, the operator places the second plug of the pair in the jack of the subscriber to be called, which lights a lamp on the keyboard corresponding to that particular cord, which lamp remains lighted until the called-for subscriber removes his telephone from the hook. This lamp then goes out and the connection is allowed to remain until both lamps in this set of cords light. The operator understands by this that both subscribers have replaced their telephones on the hook, and her duty then is to take down the cords and plugs, which automatically extinguishes the lights.

NICOLA TESLA, electrical expert and engineer, was recently shown a published statement which was telegraphed from Buffalo to the effect that he had discovered a method for successfully transmitting electricity long distances, and when asked as to the truth of it, replied: "Yes; I did state that electricity can be transmitted long distances upon a commercial basis over a distance of at least 500 miles. I will stake my reputation and my life upon it. I only qualify it by adding that the amount of power transmitted must be quite considerable."

JARBOE & CROOKS, of this city, have paid $125,000 for a controlling interest in the Tuolumne Electric Light and Power Co., on the Tuolumne river, at Columbia Hill, Cal. The plant is being enlarged, and contracts have been made with the owners of the Rawhide, App and other large mines in that vicinity for light and power.

IN Japan, Jan. 1st, '96, there were thirty-one electric lighting companies, eight of which use water power and the others steam; the total number of incandescent lamps was 80,150, or, reduced to their equivalent in eight-candle power lamps, 138,327; the number of arc lamps, nearly all of which are of 1200-candle power, was 420.

AT Monterey the Monterey Power Co. has resumed work at Little Sur river, where power will be generated and transmitted twenty-three miles to Monterey and Pacific Grove.

W. V. LOCKWOOD, of this city, proposes to put in an electric lighting plant at Quincy, Plumas Co., Cal., if satisfactory arrangements can be made to get water for power.

THE Petaluma, Cal., Electric Light & Power Company propose to spend $40,000 this summer in further improvements.

Practical Information.

A Drop of Water.

The water which is now in the ocean and in the river has been many times in the sky. The history of a single drop taken out of a glass of water is really a romantic one. No traveller has ever accomplished such distances in his life. That particle may have reflected the palm trees of coral islands, and has caught the sun ray in the arch that spans a cloud clearing away from the valleys of Cumberland or California. It may have been carried by the Gulf Stream from the shores of Florida and Cuba, to be turned into a crystal of ice beside the precipices of Spitzbergen. It may have hovered over the streets of London, and have formed a part of the murky fog, and have glistened on the young grass blade of April in Irish fields. It has been lifted up to heaven and sailed in great wool-pack clouds across the sky, forming part of a cloud mountain echoing with thunder. It has hung in a fleecy veil many miles above the earth at the close of long seasons of still weather. It has dropped as fleecy snow in the high Sierras, has washed gold in Nevada Co., furnished electricity at Sacramento, glistened in the sunlight of San Francisco bay, raced through the Golden Gate, hissed in spray on the Farallones, or swept over the bow of a vessel rounding Cape Horn. It has descended many times over in showers to refresh the earth, and has sparkled and bubbled in mossy fountains in every country in Europe. And it has returned to its native skies having accomplished its purpose, to be stored once again with electricity to give it new life-producing qualities and equip it as heaven's messenger to earth once more.

AT 60 miles an hour the resistance of a train is four times as great as it is at 30 miles—that is, the fuel must be four times as great in the one case as it is in the other. But at 60 miles an hour this fuel must be exerted for a given distance in half the time that it is at 30 miles, so that the amount of power exerted and steam generated in a given period of time must be eight times as great at the faster speed. This means that the capacity of the boiler, cylinders, and the other parts must be greater with a corresponding addition to the weight of the machine. Obviously, therefore, if the weight per wheel, on account of the limit of weight that the rails will carry, is limited, we soon reach a point when the driving wheels and other parts can not be further enlarged, and then we reach the maximum of speed. The nice adjustment necessary of the various parts of these immense engines may be indicated by some figures as to the work performed by these parts when the locomotive is working at high speed. Take a passenger engine on any of the big railroads. At 60 miles an hour a driving wheel five and one-half feet in diameter revolves five times every second; now the reciprocating parts of each cylinder, including one piston, piston rod crosshead and connecting rod, weighing about 650 pounds, must move back and forth a distance equal to the stroke, usually two feet, every time the wheel revolves, or in a fifth of a second. It starts from a state of rest at the end of each stroke of the piston, and must acquire a velocity of 32 feet per second in one-twentieth of a second, and must be brought to a state of rest in the same period of time. A piston 18 inches in diameter has an area of 254½ square inches. Steam of 150 pounds pressure per square inch would, therefore, exert a force on the piston equal to 38,175 pounds. This force is applied alternately on each side of the piston 10 times a second.

ONE frequently hears of people dying from "over exertion." Continuous work rationally performed rarely causes death. It is the pace that kills. Laboring at high pressure for a short time, no matter how long a vacation may follow, is unnatural, and unless the person attempting it is in the first flush of manhood he never recovers what he has lost in his attempt to crowd a day's work into a comparatively few hours. "Wisely and slow, they stumble that run fast," is as practical an adage as when Shakespeare wrote it, in times when there was not so much hurry in life as there is at present. More can be accomplished in the end by quiet, persistent endeavor than by occasional spurts at lightning speed.

FOR centuries the finest colored turquoises have come from Persia, but these mines are now almost exhausted. New Mexico is now the principal source of supply, and the search for these stones has proven the most profitable gem mining in the United States. The total American sales from 1890 to the beginning of 1894 were $500,000. While much of the product is pale in color, a considerable quantity is of robin's-egg blue, equal to the finest Persian stones, and a single piece is reported to have sold for $4000.

Co-operative Gold Mining in Australia.

Written for the MINING AND SCIENTIFIC PRESS by R. W. WILSON.

A visitor to almost any one of the different gold fields in Australia is usually surprised at the activity that prevails in mining matters in the gold fields towns. Almost every one he meets has a direct interest in some one or other of the various mines in process of development. It is possible that California may benefit by a careful consideration of the Australian methods for the encouragement of gold mining, which during the past twenty years have done so much for that country. On almost any Australian gold field nearly every individual who is above the position of an ordinary laborer is almost forced by the custom of the country into becoming directly interested in some form or other in the main industry upon which his district is dependent. In this way the district works out its own development and by united and concerted action achieves results that in the aggregate are little short of colossal in proportion to the paucity of the population. In California quartz-mining localities the contrary is the rule. The population of the various towns along the great mother lode belt has grown up for the most upon wages paid by absentee mine owners and companies whose capital is derived from the outside and to whom the profits find their way, to the impoverishment of the district from which they are drawn. It is different in Australia, and this is how they manage it:

In nearly every mining town there is an open mining exchange—that is, open to the public—where any person can go and buy or sell shares in mining stock. These exchanges have their regular calls and are usually open in the evenings. On the local mining exchanges one can generally get fairly trustworthy information about any mine or mining claim in the district, and the quoted price of any particular mining stock is taken as about its value for trade purposes.

When a man secures what he himself believes to be a good mine, or prospect, with the assistance of a few of his neighbors he proceeds to incorporate it into a company for development purposes. The expense of doing this is trifling and it gives something to sell, in the shape of shares, to provide money for development purposes. When the share certificates are issued the first thing to be done is to make every one who may benefit by the working of the new mine take a reasonable amount of stock. In this way the storekeeper's account is provided for, the board bill of the hotel keeper is met, and it is no unusual thing for some portion of the miners' wages to be paid in the same manner. This method of procedure is often spoken of by visitors as the co-operative system of Australian mining. By Australians themselves it is called by no particular name. It has become so usual that it has ceased to excite comment and is regarded as just the ordinary way for a poor man to develop a quartz mine so as to get something out of it and not have to sell it at a sacrifice, as is too often the ill fortune of the prospector here.

Where the strong element of co-operation comes in is this, that the merchants, store keepers, hotel keepers and others who are forced by public opinion and the custom of the country to take shares become the best possible selling agents in distributing stock that shows merit, as vouched for by its quotations on the local exchanges. The trading classes have opportunities of distributing stock that do not come in the way of the ordinary miner, and it is in this respect that their services are specially valuable. When a drummer approaches a merchant on an Australian gold field with a view to getting an order, this is about what happens:

"All right," says the merchant, "I'll give you an order. Now, I suppose your firm is making 30 per cent on this order. I have to carry a lot of stocks here for my customers. You must help me out in the matter. I will pay your invoice when I get it—70 per cent in cash or the usual trade terms, and the balance which represents your profit, you must take out in shares of the Lucky Bill," or whatever happens to be the name of the mine.

Almost invariably the drummer, after consulting his house, will agree to take the firm's margin of profit in gold-mining stocks at the price of the day in the local exchange. He then goes upon his way and tells everybody how such and such a merchant, with whom his firm "has had dealings for years," had put him "on to a real good thing." In this way he becomes a first-class selling agent and by degrees the stock begins to find its way to Melbourne, Sydney, Brisbane, or others of the big jobbing centers. If the mine continues to show satisfactory progress and a considerable quantity of the shares reach these large centers, its office is usually shifted to the place where most shares are held, and it is often reincorporated for a much larger nominal capital. If it goes on prospering and becomes popular on one of the exchanges of the larger cities, it is pretty sure to find its way to London at a big figure eventually, and the first owner, if he has retained any portion of his original interest, is certain to do well out of it. The great gold fields of Charters Towers and Gympic in Queensland, where development work is exceptionally tedious and expensive, have been built up almost entirely upon this cooperative system of mining and, after passing through the local stages, have furnished the London stock market with some of the favorite gold mines of the English investor, greatly to the advantage of the colonial miner.

In some of the towns along the mother lode of California the Australian co-operative system might be put in force with advantage to all concerned. There are plenty of people in this State to-day perfectly willing to provide money to be spent honestly on development work, provided they are assured that their money will be spent legitimately and that no portion of it will fall into the hands of the middleman who has not earned it, nor go in payment to the owner who wishes to sell a mere prospect at the price of a developed mine. It is in these respects that the open exchanges in the smaller mining towns of Australia afford some degree of security and safety to the small investor in gold mining stocks.

Recent Additions to the Collection of the State Mining Bureau.

Heulandite (fine specimen)—J. Z. Davis.

Navive Soda—Rhodes' marsh, Nevada, J. Z. Davis.

Rubellite—Damarou's ranch, Mesa Grande, San Diego Co., Cal.

Rubellite (gem variety)—San Jacinto mountains, Riverside Co., Cal., Frank H. Jackson.

Basalt Column—Mt. St. Helena, Lake Co., Cal., E. Anderson.

Gold Quartz—Cardinal mine, Tuolumne Co., Cal., A. F. Trenschel.

Gold Quartz—Marguerite mine, Placer Co., Cal., F. Deetken, Supt., and sundry others.

Also just placed on exhibition 500 rock specimens taken along the line of the mother lode through Mariposa, Tuolumne, Calaveras and Amador counties by H. W. Fairbanks. These rocks are numbered to correspond with the article on the "Geology of the Mother Lode" in the tenth report of the State Mineralogist.

H. S. DURDEN, Curator.

A VIBRATING helmet for the cure of nervous headaches has been devised by a French physician. It is constructed of strips of steel, put in vibration by a small electromotor, which makes 600 turns a minute. The sensation, which is described as not unpleasant, produces drowsiness; the patient falls asleep under its influence, and awakes to find that the pain has ceased.

*Begun in issue of April 25, '96.

(To Be Continued.)

Mining Summary.

CALIFORNIA.

Amador.

The Bay State mine, four miles north of Plymouth, is down 750 feet. A crosscut to the east is being made.

The Live Oak mine at Volcano is bonded by W. McVey of Berkeley from A. W. Robinson.

J. Treadwell of San Francisco, principal owner of the Corral Hollow coal mines, is treating for the Mitchell mine, near Pine Grove.

Republican: The Fogus mine, on Sutter creek, one mile below Volcano, will be reopened soon and operations, employing a considerable force of men, will be resumed.

At the Oneida mine the shaft is down 350 feet. Eighteen men are employed sinking, making about 10 feet a month. The rock is very hard.

The owners of the Thorp mine will put in a 46-stamp mill as soon as they can arrange for power. The mine is down 500 feet and still sinking.

Butte.

The Debris Commissioners have granted permits to use hydraulic pipes at Cherokee in washing the gravel on the bedrock, but no new ground is to be touched.

The Spring Valley Gold Mining Co. also furnishes the water for the power that runs the Pershbacker mine, Magalia. J. B. Whitcomb is receiver. The gold is washed out of the cement next to the bedrock. The big dam on the company's ground is in good order. There are five mining derricks on this claim. Four Portuguese companies own four of them, and pay a royalty to the receiver.

Calaveras.

At the Gwin mine the shaft is down 1350 feet. Cutting the station at the 1300 level is begun. A crosscut will be run to the ledge. Another level will be opened up at 1400 feet. The 40-stamp mill will be built this fall.

Supt. Ryland has shut down the Ryland mill, near Altaville, for a few months and is going to sinking.

The Gold Cliff mine, belonging to the Utica Co., has been shut down for a month on account of a scarcity of water.

W. A. Clary, former superintendent of the Sheep Ranch mine, has bonded the Fred Broomer mine, located a mile and a half east of Angels.

Citizen: The Hedrick mine has resumed this week, after a suspension of several days. The Dower gravel mine at Old Gulch will be reopened. The Rose Rock mine on Indian creek is to be worked under new management. It is reported that the Chaparral Hill mine, situated near Robinson's Ferry, has been recently bonded by E. K. Stevenot, the owner, to A. N. Butts of Salt Lake. There is a general revival in mining circles around Esmeralda. The machinery at the Esmeralda mine has been put in place. An additional force of men will be employed as soon as B. Montgomery arrives from Los Angeles. The Illich & Peirano mine, on Indian creek, is showing up well. A load of ore from this mine, taken from the bottom of the shaft, which is 75 feet deep, was run through the mill on the Cuneo mine last week. The test proved the ore to be worth $15 per ton. Salt Lake capital, under the management of Col. Woodrow, has been invested in the Peirano, situated about two and a half miles from Angels, on the Carson road. This company bonded the property for a year's time, at the expiration of which an extension of five months was granted. The developments, meeting with the expectations of the operators, resulted in the sale being consummated at San Andreas last Saturday.

El Dorado.

(Special Correspondence).—The Salisbury Company are adding additional machinery for pumping facilities to their power plant and using a rock drill in their shaft work. The new shaft is down 90 feet in solid ore.

Wm. Burton has bonded to L. M. Howe the Buckeye quartz claim, eight miles north of Placerville. There are two shafts and a 50-foot tunnel and crosscut. Development work will at once be resumed.

The Gold Note and Philadelphia, seventy-five miles east of here, are asking for bids to sink 200 feet additional to the 145-foot shaft, in which they have a good grade of ore. The ledge is said to be 7 feet.

The tunnel on the old Red Hill property has reached 425 feet on a 7-foot ledge that is black with sulphurets. This property is in the Kelsey district and is owned by parties in Scranton, Pennsylvania.

The London people developing the Richmond mines, fifteen miles west of here, are building a station on the 100-foot level.

The Davidson mine, seven miles west of here, which was a good producer, but destroyed ten years ago by fire, is about to be reopened. It was recently purchased by a New York party for $6000.

N. D. Burlingham has sold the old Esperanza properties, situated twelve miles north, to Mrs. Salina Lightfoot of Chester, England. There are three claims in the group and an old 5-stamp mill. The consideration is $150,000. The ledge at 200 feet is said to be 64 feet wide. The ore assays $5.75 per ton.

Placerville, Cal., Aug. 4, '96.

Fresno.

Republican: After ten years of development work the copper mine near Fancher creek, about thirty miles northeast of Fresno, is now about to be worked on a large scale by a company that has it bonded. Tunnels have been run and shafts sunk, and that there is a large body of excellent ore is no longer a matter of doubt. The advance in the price of copper has added greatly to the value of the property. It is probable that smelters will be built near the mine for the reduction of the ore. Some years ago ore from this mine was shipped around Cape Horn to Baltimore, where it was smelted, and the business paid until copper fell below 10 cents a pound. It is now about 11 cents, and it certainly should pay if the ore can be reduced at the mouth of the mine.

Inyo.

The Confidence mine and mill is still closed down. The property is in the Amargosa range, in the southern part of Death valley. It is owned by Cannon & Langford, of Salt Lake, Utah, who also own the noted Johnnie and Chispa mines at Montgomery, Nye county, Nevada. These properties are also idle. The proposed new postoffice at Resting Springs, to be called Amargosa, which was petitioned for by all Federal and county officers along the line and strongly recommended by all California Senators and Congressmen, has not been established. Nevada has two postoffices over there—Pahrump and Manse, connecting with Daggett—only seven miles apart, but all Southeastern Inyo has none. An extension of only thirty-three miles would place the borax and mining interest of that region in communication with the rest of the county in which they are situated.

Kern.

Lattin and Defrance have $500 in gold which they have taken out by dry washer process during the month of June. Owing to the intense heat they were unable to work only in the morning and evening. A great deal of the gravel will run $1.50 to the pan; from six hoppers they realized $47.60. A hopper of sand will weigh about seventy-five pounds. The great drawback to mining in the new district is the lack of water, but this difficulty will be overcome in the near future. Wells are now being sunk with fair prospects of getting good water. Where water has been obtained it is so strongly impregnated with magnesia that it cannot be used.

Merced.

Talking of the Merced property the Boston *News Bureau* says: "The unanswered problem in respect to the Merced gold mining property is how several hundred assays could show a capacity to pay $1,000,000 a year in dividends on Merced stock, or $10 per share, and present operations fail to reveal paying ore in any quantity. This is a mystery which we understand has not yet been solved by the Sears building people. The larger part of the $2 called upon Merced has been paid in and within a reasonable time the unpaid calls, together with the interest, will be asked for and later the remaining $3 per share may be invited." There is no intention whatsoever of abandoning the Merced property. It is regarded as one of the valuable properties of the mother lode, and sinking to the 1000-foot level will go steadily forward. It is no longer a question of milling operation; it is a question of finding profitable ore bodies.

Mono.

The superintendent of the Bodie Con. reports: During the week ending August 2nd east crosscut 1 from the main north drift, 200 level, was extended 14 feet, passing through small seams of quartz. The face is in soft porphyry. Upraise from east crosscut, 300 level, was extended 30 feet. There is a small seam of low-grade quartz about 10 inches wide in the top of the raise. The winze below the 550 level was sunk 5 feet. There is a small seam of ore in the bottom of the winze. Will start to drift north through the fault from the bottom of the winze. They have taken out and hoisted during the week six cars of ore from the old fillings in the Gildea stope, 200 level, estimated value $20 per ton.

Nevada.

The Shasta Mining Co. are advertising for bids to run 700 feet of tunnel in the California mine at Graniteville.

Pascoe and Maxwell of Silverton, Colorado, are at Meadow Lake. They expect to develop the Oro Fino quartz mine, which they purchased last year for $3000.

The Omaha Mining Company has bought the Homeward Bound Mining Company's claims adjoining the Omaha.

Placer.

The Red Dog Mining Company at You Bet, eight miles north of Colfax, have their new hoisting works in place and are running an incline on the channel at Missouri canyon.

Heath & Doolittle are developing their Lost Emigrant mine, sixteen miles from Cisco.

Plumas.

Geo. Maurer has taken a contract to build a debris dam for the Quincy Mining & Water Co., at Green Flat, the structure to be 245 feet long and 25 feet high.

At the Niagara Consolidated men have been put to work on the Bunker Hill and North American and are also engaged building a road to connect the two. It is the purpose of the company to work the North American next season both by hydraulic and drifting in the lower tunnel, while 40 men will be put to work in the Bunker Hill. Capt. Meikle is in charge.

Independent: Superintendent Schnabel of the Good Hope mine at Saw Pit Flat is cleaning up the season's work. The mine will probably shut down in another week till next season. In the meantime large additions will be made to their water supply. A new ditch will be dug in Onion Valley, an old one cleaned out and put in repair and the reservoir enlarged. It is expected next season to have ample water for a much longer run.

San Diego.

The Nectar mines, Picacho, San Diego county, have been bought by a Philadelphia syndicate. Development will immediately follow, and a large mill is to be added. Jesse E. Grant and ex-Senator Dorsey are owners of adjoining properties.

At the Golden Cross Mining & Milling Co. at Hedges for the week ending July 18th the work of pumping out the water from the Queen incline shaft, which was turned in to quench the fire in the old cave, progressed very much faster. It was at that date below the 400-foot level. The inclined shaft is not so badly caved below 400 feet as was feared, and the prospect is better to get the 500-foot level opened up. The supply of ore from this mine is from the 150 and 300-foot levels, and aggregates 100 to 120 cars per day. This ore runs about to $8 to $10.

The 300-level of the Cross mine is being opened as fast as circumstances will permit. The work is now being pushed by machine drills, as the station is opened far enough from the shaft to admit of the use of Burleighs without danger to the wall of the shaft. From 100 to 125 tons of ore per day are taken from this mine.

The Crown mine is doing well. The bonanza streak of 8 feet in thickness on the 300-foot level is opening out well and now shows a lateral extent of 70 feet. The same ore chute has been cut in the 200-foot level, and that level is now being opened up. The other two chutes of ore in this mine continue about the same. The incline is being sunk to the 400-foot level, and pipe is to be laid at once to convey compressed air to this mine so as to expedite the work. Burleighs will be at work there in two or three days. One hundred to 125 tons of high-grade ore is taken from this mine per day. The last cleanup, though the run was handicapped by many adverse things, was upwards of $20,000, or better than $1000 per day for the run.

Shasta.

(Special Correspondence.) — The Wallace, Graves and Rainbow mines, the property of Wallace & Saltzer of Redding, now bonded to Wm. Jackson, are located in Squaw Creek mining district, three miles west of Kennett R. R. station and nearly eighteen miles northwest of Redding. The ore body of this group of mines is base in character, carrying gold, silver and copper. The ledge runs to the north and south and dips to the west at an angle of about 45°. The walls are white porphyry, as are all others in this Iron mountain locality. The ore body, capped by gossan, that crops out for a distance of 1800 of the 4500 feet of the mine, is 70 feet thick between the walls. The present management have crosscut the ore body with three different tunnels, in about 100 feet each. They have about 400 tons of ore on the dump that, from an average of twenty-three different assays, will pay $10 in gold, $10.50 in silver and 4 per cent in copper per ton. A small amount of this ore can be milled, but the majority of it will have to be smelted. Free water and timber at hand.

The Balakiala Mining Co. has fourteen different claims. The principal work is eight tunnels, from 40 to 600 feet long, and three shafts, that have been sunk to from 24 to 90 feet. The ore bodies run northeast and southwest and dip to the southeast. The walls are porphyry and trachyte. The ledge matter is capped with a gossan casing. This mine is temporarily idle, awaiting machinery.

The Gray Fox mine, owned and managed by Wm. R. Conant, is 50 miles southwest of Redding, near the dividing line of Trinity and Shasta counties. This mine is 1500 feet in length, runs northeast and southwest and dips to the southeast, between walls of black slate. There is about 14 inches high-grade, free-milling ore, averaging about $50 gold and carrying about 1 per cent of sulphurets. This mine is being developed through three different tunnels, one above the other; the upper one is in 76 feet, the second 180 feet, the third 30 feet. There is an air shaft 106 feet deep. There are a No. 2 Rocker mill and two concentrators, run by steam power during the dryest season, about four months, and by water power for the balance of the year, working ten men in mine and mill. This is almost a new district and the above are recent discoveries.

The Shasta Dredging Co., J. M. Gleaves, president; Colonel R. W. Button, superintendent has recently placed a 40 H. P. machine in the Sacramento river just above Redding, operated by an engine and boiler, having an 8-inch sand pump; a steam pump operates a hydraulic jet reduced from a 4-inch stream to a ¾ jet. The jet cuts up the bottom of the stream, and the pump brings up everything including rocks 6 inches in diameter.

The John C. Hughes Mining Co., Geo. W. Grayson, Jr., superintendent, four miles northwest of French Gulch, has the American mine—a consolidation of six claims, and the Gold Bar, a combination of five claims, with a 10-stamp quartz mill run by water power ten months in the year, and by steam the other two. The American mine series is pierced by four tunnels, from 80 feet to 500 feet. This ore body runs east and west and dips south; hanging wall porphyry; foot wall slate; ledge varies from 12 inches to 5 feet thick. The rock is classed as low grade, averaging $6. The rock is free milling, the gold is coarse and all caught in the batteries. The Gold Bar combination is one mile east of the American, and runs in the same direction, with wall similar to that of the American. The ore body runs from 2 feet to 3 feet thick, and pays from $10 to $25 per ton. This mine is being developed by two tunnels, one in 150 feet, the other 250 feet. The last mentioned tunnel is a crosscut, and is not yet into the ledge. The values above quoted were from a mill test of 20 tons. Their mill is located one and a quarter miles south of the American and two miles southeast of the Gold Bar mine. The ore is transported by wagons at a contract price of $1 per ton. They are working 18 men in mines and mill.

Washington Quartz and Placer Mining Co., John Syme superintendent, is situated two miles west of French Gulch, consists of 80 acres, patented under the law allowing both placer and quartz entered together. The quartz portion consists of two systems of ledges, one running north and south, and dipping east, and the other running east and west and pitching south. The walls of both ledges are alike—hanging walls, slate; foot walls, porphyry. The north and south ledge averages 4 feet, free milling and carries 1 per cent of sulphurets. The east and west ledge is 3½ feet thick, and the same as the N. & S. in character. The ore will average $10 per ton in free gold. They own a 10-stamp mill (previously made for 22 stamps) run by water power, one of the oldest in this county. These ledges have been pierced by three tunnels on the east and west ledge, No. 1, in 1,000 feet —300 feet on the ledge; No. 2, is in 250 feet, and considerable stoping has been done, and No. 3 is in 500 feet—250 feet of which runs through ore. On the north and south ledge two tunnels have been run, one 450 feet, the other 200 feet to the ledge. The character and pay of both ledges are similar. The mine is temporarily idle, awaiting the erection of a new mill. Over $750,000 has been taken from the above combination of mines since their discovery in 1853. The placer portion of this company's property was worked by hydraulic process, by former owners, some 20 years ago, and is reported to have paid well.

The Gold Dirt mine, owned by D. Lyons & Co., is on Maddox creek, six miles north of Stella, J. Bradbury superintendent. This company's ore body runs north and south and dips east. The vein averages 4½ feet between walls of porphyry. The development consists of two shafts down 30 and 40 feet respectively. From 100 pounds of rock crushed in a mortar from this mine $54 was obtained, and from a mill test of nineteen tons it paid $18 per ton. A full force of men will be actively engaged by this company before this is in print.

The New Brunswick mine, owned and managed by F. B. Rossi, is on the Trinity divide, six miles west of French Gulch, and consists of three original locations. The ore body runs at an acute angle entirely through the mountain, northeast and southwest, and dips to the northwest. The ledge matter consists of a conglomerate of quartz, slate and porphyry, and runs from 75 to 100 feet thick between the walls. It is being developed by shafts and tunnels, and from both sides of the mountain. On the north side of the mountain one tunnel is in 400 feet, and a shaft has been sunk 40 feet. From this tunnel two upraises have been made, one 160 feet, reaching the surface. Two tunnels have been run in on the south side of the mountain, one in 80 feet, thence along the foot wall by drift for 200 feet. The second one has been driven in 360 feet, and drifts run northeast 25 feet and southwest for 15 feet. A mill test of 290 tons ran from $18 to $4 per ton. A 4-stamp mill is being put up on the south side of the mountain. The rock in the upper tunnel is free from sulphurets, and that found in the lower tunnel on the same side of the mountain is 25 per cent sulphurets.

Van Ness, Baker & Co. opened up a prospect some time last spring at a point ten miles north of French Gulch, on the east side of the Trinity Center road. The ledge matter running east and west, without any definite method of working it, they followed up some traces of free gold from the surface, and in a few feet took out over $11,000 in gold. The "company" part of this firm was entrusted to take this find to French Gulch for shipment. He has not been heard from since, although reported to be in business in San Francisco — since which time some $10,000 more has been taken out. L. P. Mc.

Free Press: The Mountain Mines, limited, are able to resume the operation of their entire property. They have not resumed work at the mine at Iron mountain. The ore trains are running irregularly, but there is more activity since the railroad was completed. Trestles and bins are being built at the switch back on the Iron Mountain Railway. Men are there quarrying the stone to be used in the construction of the roasting furnaces, which are 6x12 feet. When the whole plant is completed the roasters will number 500, to treat the ore for reduction at the smelters. The ore, which contains so large a percentage of sulphur as to cause it when heated in the smelter to form into large chunks, which seriously interferes with its operation, will be placed in the roasters. The sulphur will be fired and it is expected at the end of three weeks will consume itself.

At the switch-back the ore will be handled entirely by gravity. At Keswick the framework for a water-jacket smelter is up, and the iron supports for the castings of the smelter.

On Tuesday morning a fire was put in the patent smelter. There is a quantity of ore on the dump, which has been treated in the roaster which was built in the smelter yards. Much ore, which has not been treated, lies on the dump ready for roasting.

Searchlight: A builder's contract was filed with the County Recorder July 22d, in which the Joshua Hendy Machine Works of San Francisco, agrees to construct and place upon the land of the National Consolidated Mining Company, in Rich Gulch Mining District, this county, particularly on the portion known as the Potosi mine, a 10-stamp mill for crushing and reducing ores, to be completed on or before October 6th, 1896, and for which they are to receive $8250.

J. W. Frank, Red Bluff, who had eight mining claims in Harrison gulch, sixty-five miles from Redding, bonded them to J. H. Roberts of Sacramento, former owner of the Great American mine in El Dorado county for $110,000. W. H. Fowler and J. W. Frank are interested with Roberts in the purchase. They intend erecting a 20-stamp mill, with steam power.

Sierra.

A rich strike is report at the Buttes mine, Sierra City. Preparations to build a mill at the mine are reported.

The Craycroft mine has closed down.

Siskiyou.

Journal: Coulson & Thrash have leased their mine on Humbug to Brown & Hawland.

The Hegler Bros. at Humbug are getting

out some excellent rock which they crushed in their mill.

The Distleborst & Barton Dredging Company have been running their machinery on Klamath river the past few days, in order to have everything running smoothly when they start to work. The machinery works well.

S. Gardner, of the Gardner mine at Oro Fino, reports that his cleanup this year was $12,000. The Eastlick Bros. and Wright & Fletcher have also made their cleanup, and the returns have been satisfactory.

Tuolumne.

Democrat: At the App, since the repairs to the mill, from sixty to seventy tons are crushed daily.

At the Star the mill has been shut down owing to the scarcity of water. The mine is in good shape, producing high-grade ore. Arrangements are being made for putting in a four-drill air compressor plant. Chlorination works will shortly be built and a survey for a storage dam on Rose creek is now being made. The dam is to have a capacity of 38,000,000 gallons.

Supt. Trittenbach of the Dutch mine will put in a double hoisting plant, two boilers, pumps, etc.

At the Soulsby the new hoisting plant lately put up will soon be in use, after which the work of opening the mine will be pushed. Supt. Sharwood, in addition to his duties at the Soulsby, is working the Baker mine on his own hook.

The Golden Gate management is putting in an electric plant to furnish power for the hoist and lights for the mill and underground workings. It will be run by water power and will soon start up.

The Jumper keeps up its development work in addition to supplying the twenty stamps with ore. The tunnel being run to tap the New Era shaft will soon reach its destination.

C. and J. Fitzgerald of Quartz Mountain and C. Durgan of Jamestown have received the final payments on the purchase price of the New Era mine from the Jumper Co., who purchased it. The sum for which it was bonded was $30,000.

Democrat: A strike in a pocket of the Cardinell mine, near Tuttletown, is reported. In one instance years ago on the 200-foot level of the Cardinell picks unearthed a pocket valued at over $100,000.

At the Santa Ysabel the new machinery is being put in position.

New hoisting machinery is to be put in the Alabama.

The Mazeppa managers are going to put up a hoisting plant.

It is reported that two new deep shafts will be started at Stent, one on the Erin Go Bragh, the other on a claim near the Golden Rule.

The Doyle quartz and placer claim at Horseshoe Bend, on the Tuolumne river, has been bonded to Stover and Shorey for $9000.

NEVADA.

ON THE COMSTOCK.

Hale & Norcross superintendent's report: Main shaft—We continue easing timbers and making other necessary repairs in main shaft between 900 and 975 levels.

900 level—Have continued the work of cutting out a place in north drift, 154 feet from station, preparatory to starting an upraise from this drift. Have also been working on the sill floor. The general appearance of the ore streak is about the same as last reported.

975 level, No. 3 upraise—Have been working north on the tenth floor. The ore streak is very small on this floor. Have made necessary repairs on this level the past week.

Extracted during the week nine cars of ore, assaying, per mine car samples, gold $69.55, silver 39 9-10 ounces per ton.

Forwarded by express to U. S. Mint, Carson, on July 20th, 107 pounds of crude bullion (assay value as yet unknown).

This is the final bullion shipment for account of ore shipped in June and July and reduced at the Dazet mill, viz, 245 tons and 1800 pounds.

Brunswick lode (operated under the management of the Hale & Norcross Co.)—Main north drift from station was advanced 40 feet; total length 137 feet. Face in porphyry and stringers of quartz. East crosscut from south drift (30 feet from south boundary) was extended 6 feet, making its total length 36 feet; face in hard rock. Have started a south drift from this crosscut at a point 15 feet in from the main south drift, and advanced same 6 feet, showing both streaks of ore first cut in crosscut coming together.

ESMERALDA COUNTY.

The Grant Mountain Mining Company has fourteen men stoping ore from the 50-foot level. They have about 20 inches of free milling ore in the bottom of the Roper shaft, which is down 35 feet. C. A. Hascall is superintendent.

LINCOLN COUNTY.

The sale of the Keystone Mining Company's property advertised to take place July 20th, and continued for a month, says the Pioche *Record*, has not yet occurred, though it is expected to come out all right. The trouble seems to be that the New York parties who agreed to put up the necessary funds for the Lincoln company (which was organized to handle the property) failed at the last moment to honor their paper, and the matter is being pushed by attorneys for the Lincoln company, who propose to hold the New York parties to their contract.

OREGON.

BAKER COUNTY.

At Union, Or., a deal was consummated this week, the placer grounds on the headwaters of Grande Ronde river in the southern part of Union county being sold to French capitalists for $200,000.

WASHINGTON.

Snohomish *Tribune*: The "45" Mining company has a pack train of twenty ponies packing ore from the Sarah mine near the upper Sultan. The ore is packed twenty miles. The cost must be $50 per ton. Niemeyer, Andrus and other Machias parties are interested.

BRITISH COLUMBIA.

SLOCAN DISTRICT.

The decision of Justice Walkem in the Monitor case (Wills vs. Petty) gives a good precedent for the non-validity of verbal promises, or alleged promises, to share interests in mining claims. The Monitor was discovered upon the side hill opposite Three Forks last summer by George Petty. An option carrying $30,000 for thirty days was given, $500 being paid down. This option was not taken up. With the $500 as a start Petty began to ship ore, and the late prospect became a nice paying little mine. As soon as this was accomplished more or less claims of being "in on it" were preferred; and these, it is satisfactory to observe, have been decided as of no avail. The case is, however, carried on appeal to the Supreme Court of British Columbia. The matter is one of great moment to prospectors. Their partnerships and grub stake agreements are of the loosest kind. A man easily gives interests in his future prospects, but after spending hard work and money in proving them worth holding he is inclined to let his friends who are "in on it," and who have not done a stroke of work, carry their case to court, especially if the arrangement is not on file.

According to the customs returns of Nelson, and data furnished by the C. K. S. Navigation Company, a little over a million and a half dollars' worth of ore has been so far shipped out of West Kootenay for 1896.

At Boundary creek the "Mother Lode," Deadwood Camp, has been bonded to Col. Weir for $14,000. A preliminary payment was made and the remainder is in two equal installments at the end of six and nine months. The gold-bearing ore is copper pyrites, with a gangue, and, in some parts of the deposit, of solid magnetite; in others, of lime, pyroxenite and silicious material.

The Rossland *Miner* claims positive information that there is an option on the Le Roi and that it has been examined by the same experts who have come from London to examine the War Eagle under the Corbin option. It is understood the price of the Le Roi under the option is $2,500,000, but on this point we have no definite information. The third and last expert to examine these properties is now here and will make his report in a few days. The option expires September 2.

The report that the smelter of the Kootenay Mining and Smelting Company at Pilot Bay had passed into the hands of the Consolidated Kansas City Smelting and Refining Company seems premature though its absorption by that enterprising company is not at all improbable.

At Trail the new blast furnace for the British Columbia S. & R. company is being put in place. It will be in full operation September 1st. The smelter will have a daily capacity of 500 tons. A contract for an $8,000 office building for the smelter and Columbia & Western railroad has been let. The steamers are landing on an average 100 passengers a day. Development work on Lookout mountain continues, an average assay on the Sovereign, at a depth of 42 feet, running $28.

ALASKA.

Juneau *News*, July 23: The latest news received recently from Berner's Bay is that there is no prospect of the Comet mine being worked for many months yet. Good progress is being made on the lower tunnel, but it can scarcely be completed before January 1st. This is the richest mine in the Territory of Alaska, and its cessation from being operated for so many months will take off not a little from the gold output of the country for this year.

IDAHO.

The tailings works of the Fortuna Mining Co. at Duniphan will be ready to be started up next week. The works will use the cyanide process, with modifications which H. K. Thurber, managing owner of the property, has made as tests seemed to require. In these works there will be four oblong and twenty-two circular tanks. The oblong tanks will be 30 feet long, 3 feet wide and 2 feet deep; the circular tanks 36 feet in circumference, 11 feet 6 inches in diameter and 50 inches deep. If the process to be availed of is as effective as expected, the output of the Fortuna will be doubled—at least, while the tailings are reduced, anyway. There are said to be fully $150,000 worth of tailings at the old dump, and the mill is making more every day.

Lewiston *Teller*: The big mining boat, which was designed to gather gold from the bars of Snake and Clearwater, has been operated for a week. The bar was not rich and the gold is of the finest, lightest character. The gold is light and flaky. The machinery worked with perfect effect, and the sluices saved the gold. The company has a system of gold saving appliances, consisting of sluices, metal ripples, quicksilver catch basins and overlaps. After a run of four or five days there is hardly a color left in the sand. The clean-up gave a result of 27 cents to the cubic yard. The plant will be removed to another bar that is known to be very much richer.

The Little Giant mine at Warrens has been bonded by eastern men for $100,000.

MONTANA.

The Hope mine at Basin has been sold under attachment for $70,000, the amount of an overdraft on Helena. The company will be reorganized and development continued.

The De Lamar, Idaho, reports for June: Mill worked 20 days; crushed 3100 tons. Bullion produced in the mill, $38,365; estimated value of ore shipped to smelters, $4,775; miscellaneous revenue, $415; total produce, $43,555; total expenses, May and June, $37,389; profits for two months, May and June, $6,1668. Strike of miners and laborers caused a stoppage of work all of May. The men resumed work on June 4 at an advance of 50 cents per day. Milling at half capacity was started on June 8.

The Iron Mask at Basin has a vein of shipping ore. A 100-ton concentrator will be built.

The Ontario mine is shipping 30 tons of concentrates per day, valued at $1000. The railroad from the mine to Elliston will not be built this year.

Butte *Inter-Mountain*, Aug. 1: A big mining deal was consummated in Butte to-day when James A. Murray received from D. G. Bricker a check for $360,000, in full payment of the bond on the Moonlight lode and the east 500 feet of the Blue Jay claim near East Granite street.

The two claims were bonded to Mr. Bricker nearly a year ago, the Moonlight on a $60,000 bond and the east 500 feet of the Blue Jay for $300,000. Extensive development work has been in progress since that time. Two shafts have been sunk and a vein 60 feet in width has been opened up, eight feet of which will assay 40 per cent in copper. People who know say that the two properties are among the richest in the district, and that an offer of $710,000 was made for them by a big corporation some months ago.

It is understood that the properties were purchased by Mr. Bricker for Marcus Daly, and that Mr. Bricker will clear something like $100,000 on the transaction. The magnitude of the deal tends to show the value of the big mineral deposits of Butte.

A rich strike of copper glance was made during the week at the Glengarry mine in the Ground Squirrel district. This property is owned by the Montana Ore Purchasing Co. It is developed to a depth of 800 feet and the strike was made on the west drift of that level. The vein is a large one with two feet of copper glance carrying about eight ounces in silver.

WYOMING.

Lincoln, Neb., men, who have been inspecting the gold-bearing property of the Burlington Mining Company at Buffalo, have, in consideration of an interest in the mine, contracted to put up a sixty-ton stamp mill on the property within ninety days. The cyanide process will be used. The contract requires the investors to mine 1800 tons of ore for the first mill run.

COLORADO.

The large cyanide reduction works in course of erection at the new town of Cyanide, two miles north of Florence, will be ready to treat ore September 15th. The building, which covers the power house, sampler and crushing mill, is 100 feet wide by 200 feet in length and 70 feet high. West of this mill is another building of steel and iron, 65x95 feet, and contains a half dozen roasting furnaces to be used in roasting ores which do not otherwise yield readily to the cyanide process. The third and last department of the new works is the leaching building, covering a ground space of 59x195 feet. In this building will be placed three 650-ton steel tanks and four smaller ones of sixty tons capacity each.

The metallic extraction works of Florence, when completed, will be the largest of the kind in the United States.

Under date of July 31 F. H. Pettingell writes from Colorado Springs regarding mining stocks: Some stocks are high at any price, and I would caution all against buying cheap stocks indiscriminately, as the purchaser may awaken only to ascertain that the territory supposed to belong to the company has passed into the hands of others by default; this all too frequently occurs where patent proceedings are not properly cared for. It is always well to carefully scan the personnel of the management; ignorance is far more common than dishonesty in mismanaged corporations. I believe that after the Presidential contest is definitely decided, we will experience the broadest mining stock boom the country has ever beheld, not based on a hollow desire to speculate, but on business principles.

At Leadville Judge Owers has appointed W. H. Griffith receiver of the Weldon mine, which was seized by Peter W. Breene, owner of one-twelfth interest, after the miners struck for an advance in wages from $2.50 to $3 a day. Breene had reopened the mine, paying the wages demanded. The receiver was appointed on the application of the Weldon Mining Co. Judge Owers directed the receiver to work the mine and pay $3 to miners and $2.50 to laborers above ground. The union's demand is for $3 for all employed. This may result in a settlement of the long-continued Leadville strike.

Georgetown *Courier*: A one-tenth interest in the Badger lode at Empire has been sold for $35,000. The proceeds of the sale will be used in the purchase of a mill and in development.

NEW MEXICO.

At Pinos Altos the Golden Giant is working 45 men in the mine and mill.

The Treasure Mining Company has laid off a number of miners until connections are made between the 150 and 300-foot levels.

At Mogollon the Maud S. mine employs fifteen miners. The Colonial Company is working twenty men on the Last Attempt mine, which is furnishing free milling ore for ten stamps of the Maud S. mill, while the Maud S. mine furnishes sufficient concentrating ore for the other five stamps to handle.

The Little Fanny mine, conceded to be the richest mine in camp, still remains closed down. There was an abundance of ore developed and in sight when the mine closed down. Why the mine is not worked by the owners is a mystery.

The Confidence mine still continues the regular output of 80 tons per day, which is crushed at the company mill on Whitewater. L. Woods is superintendent.

ARIZONA.

(Special Correspondence).—Supt. S. A. Parnell of the Old Dominion copper mine has the property in good shape for the production of ore. All the stopes on the various levels are looking well. The new sinking pump is in place in the shaft and sinking was resumed on the 18th ult. The shaft (three-compartment) is now down 450 feet. At the hoisting works are three horizontal tubular boilers 5x16 feet and a new boiler house. Supt. Parnell is expecting the arrival of another new furnace that will have a daily capacity of 100 to 125 tons, when the present force of 150 men will be increased and more bullion turned out.

E. H. Cook, superintendent of the United Globe mines, has returned from Geronimo, the present terminus of the Gila Valley Globe and Northern R. R., where he had been to hasten the forwarding of a new 100-ton furnace and other machinery that he is waiting for. The smelter has closed down to make improvements that, when completed, will more than double the present smelting capacity. The smelter men have other employment during the shut-down.

The Black Copper group of copper claims, under bond to J. A. Fleming and Dr. J. M. Ford, six miles southeast from Globe, are under the management of W. W. Hill. The group comprises fifteen claims, the most noted of which are the Black Copper, Copper Dyke, Green Carbonaté and Montgomery. These properties have large quantities of silicious ore in sight. Supt. Hill has two shifts sinking on the Black Copper, and is now down 100 feet and has been in ore all the way. At 100 feet he is crosscutting and is in 15 feet and is still in ore going from 10 to 20 per cent. They are also sinking on the Montgomery and have equally as good a showing. These leads can readily be traced a distance of six full claims. Mr. Hill is as yet undecided whether he will erect a smelter or a leaching plant. It all depends what his base ore will be. If it carries an excess of iron, he will erect a modern smelter on the property. If there is not enough iron in his base when he reaches it, he will put up a leaching plant, manufacture his sulphuric acid on the ground and use electrical precipitation. It is confidently expected here that when this company gets in full swing there will be a town in that vicinity that will compare favorably with that of Globe.

Globe, Arizona, Aug. 1st, '96.

Gazette: Another shipment of silver ore from the Eclipse mine will be made next Monday and the big freight teams have orders to return immediately as still another carload of rich ore worth about $4,000 a car is ready for shipment. The Eclipse is the only silver mine in Arizona that works extensively.

Messrs. Tomlinson and Brandon of Prescott were recently in San Francisco. They represent the Brown Dake Gold Company of Arizona, capital $1,500,000, recently organized, which last May bought nine claims at Prescott, which have a record of producing $300,000. There is a 20-stamp mill on the property, an assay outfit and concentrating machinery. As to mining in Arizona, Mr. Tomlinson says that prospects are good and the mines are doing well. The Congress mine, a gold property sixty miles south of Prescott, is running a profit of $40,000 per month. It is putting in forty more stamps, doubling its capacity, and is building four miles of railroad to connect with the Santa Fe, Prescott and Phœnix. Petroleum will be used for fuel on the railroad and in the mine. Near the Congress is the Planet group, owned by a Boston syndicate. It was purchased for $40,000 cash and $50,000 was put up for a working fund.

The *Herald* hears that another attempt will be made by a French syndicate to work the placer beds of the Colorado river. It is thought they will put in a power plant that will melt the cement strata through the gravel.

At Mammoth, Pinal county, this week, a flood nearly swept the entire camp away.

Government sampling works are to be erected at Nogales at a cost of $10,000. The late Congressional appropriation set aside $35,000 for three Government works, one at El Paso and the other two on the northern boundary.

MEXICO.

The principal mine at Guanajuato is the Valenciana. It has thirty-two miles of underground workings. The main shaft is 2700 feet deep, of octagon shape, walled with stone, and 32 feet across. It is said to have produced $10,000,000, principally in silver, and to have employed from 3000 to 5000 men. It now employs about 1000 men in the upper levels. In the lower levels and shafts are 800 feet of water. It is said that at the bottom of the shaft there is 30 feet of rich ore. All this immense work was accomplished by hand, without a particle of machinery. It is estimated that it would cost $500,000 to erect a pumping plant to get this water out and keep it out. There are driveways for miles zigzagging down into the mine to a depth of 1000 feet. At one time there were in the neighborhood of 4000 arrastras at work in the town and 1600 tons of ore were crushed every 24 hours. At present they are crushing about 350 tons of ore a day.

A Hermosillo dispatch says: "The Rothschilds have just closed a deal for a group of

the richest gold mines in this State. The reported purchase price of the properties is $5,000,000 in gold."

SOUTH AFRICA.

The Transvaal State Mining Engineer, Mr. Klimke, reports from that section that the total yield of gold for 1895 was 2,494,487 ozs., of the value of £8,569,555, as against 2,239,865 ozs., valued at £7,667,152 for 1894, and being an increase in ounces of 254,622, and in value £902,403, or an advance of 11 per cent. The increase is attributed chiefly to the extent of the development of the old Witwatersrand mines. The improved means of working gold is instanced in the fact that the yield per stamp per day of 24 hours has increased from 3627 ounces per ton to 4009 ounces per ton, or almost 10 per cent. In 1895, 3,903,333 tons of quartz were crushed compared with 3,269,462 tons in 1894, an increase of 633,871 tons, or 19.4 per cent. The yield of gold from the mills was 1,636,135 ounces, compared with 1,457,103 the previous year, an improvement of 172,932 ounces, or 12.3 per cent. Gold obtained from the mills comprised 68.8 per cent of the total yield, compared with 68.4 per cent in 1894.

From tailings the yield was 749,325 ounces, of the value of £2,282,903, equal to 26 per cent of the total yield. Some 3,015,986 tons of tailings were treated by the cyanide process and 193,256 tons by other processes. Concentrates gave 105,900 ounces, valued at £383,998, equal to 4.48 per cent of the total yield. The average yield of concentrates obtained from the Witwatersrand conglomerate was 3072 ounces per ton, and from the quartz in the mines near Barberton, 6394 ounces per ton. By the chlorination process 14,820 tons were treated, giving an assay value per ton of 4710 tons, and from this 90¼ per cent assay value was obtained. By the cyanide process 19,558 tons were treated, with an assay value per ton of 1535 ounces, of which 91.6 per cent was secured. Altogether there were 34,378 tons of ore treated by concentrates, which yielded 2904 ounces per ton.

The gold yield of the placer mines shows a decrease of 3666 ounces, valued at £12,806—that is, 0.2 per cent of the total yield in 1894, compared with 3127 ounces, valued at £10,982, or 0.12 per cent of the total yield this year. In 1885 the yield in ounces was 1737; ten years later it had reached a total of 2,494,487. The grand total for the twelve years, from 1884 to 1895, inclusive, was 9,749,170 ounces, representing a value of about 33½ millions sterling.

During 1895 there were working above and below ground, in connection with the gold mining industry, 7523 whites and 54,127 colored people, mostly Kaffirs; underground there was an average of 6116 whites and 47,240 colored people. By these workers, in the course of the year, 133,417 meters of driving were done, and 48,228 meters of shafts sunk. The total quantity of quartz excavated amounted to 4,377,142 tons. During 1895, 26 whites and 139 colored people were employed on the alluvial fields.

Dealing with Witwatersrand, Mr. Klimke states that these fields produced 89.77 per cent of the total yield of the country, namely, 2,223,066 ounces, valued at £7,693,371. During 1894 they produced almost 88 per cent of the total yield, so that last year there was a slight increase in the proportion. At the end of 1895 there were in force on these fields 92,305 prospecting and 3283 digging licenses.

In the introductory portion of his report, the State Mining Engineer says that, so far as can be ascertained from the returns of the mining companies, which at the end of last year numbered 170 (not calculating the mines worked by syndicates and private persons), there was a nominal capital invested in the industry of £43,544,983, an issued capital of £40,787,029, and a working capital, including cash payments to vendors, of £12,037,225. The working capital, therefore, amounted to about 29½ per cent of the issued capital. The increase of capital during 1895 amounted in round numbers to £18,000,000 sterling, or about 78 per cent of the aggregate issued capital of the previous year.

The total amount of dividends paid out by mining companies to the end of 1894 was £5,159,930. Of this, £100,830 consisted of dividends paid by coal mines, leaving a balance of £5,050,100, or about 24 per cent of the total value of the gold yield to the present time as dividends paid by gold mines. The figures for 1895 are for gold and coal mines, together, £2,595,210; for gold mines alone, £2,550,712, or about 30 per cent of the year's output of gold. At the end of the year there were 281,691 prospecting and digging claims.

The following is a summary of the total operations in the Witwatersrand district for the three months ending Sept. 30, '95, and for the first three months of '96:

	Quarter End'g Sept. 30, '95.	Quarter End'g March 31, '96.
Meters driven	31,273	23,373
Meters sunk	10,447	8,208
Tons ore extracted	1,044,586	909,172
Tons milled	912,061	819,350
Tons milled, dry process	....	3,343
Tons per stamp per day	4.142	4.245
Concentrates prod'd, tons	9.578	8.658
Concentrates treated	8.772	7.107
Assay value, ozs	2 898	2.943
Tailings treated, tons	764,410	593,677
Assay value, ozs	0.237	0.249
Whites employed	6,764	7,221
Colored employed	46,506	42,392
Mill yield, ozs	393,793	318,757
Mill yield per ton, ozs	0.432	0.389
Value	£1,421,110	£1,146,038
Value per ton	21s 2d	28s 0d
Concentrates yield, ozs	27,030	21,719
Concentrates assay, ¥ ton	3 061	3.056
Concentrates value, ¥ ton	221s 10d	222s 7d
Tailings, ozs	163,519	134,371
Tailings per ton, ozs	0.214	0.226
Tailings, value	£519,581	£424,051
Tailings, value per ton	13s 7d	14s 3d
Total production of the Witwatersrand, ozs	584,342	476,921
Value	£2,037,530	£1,655,659

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper. *

The 43rd Great State Fair of California

WILL BE HELD AT

1896—SACRAMENTO—1896

THREE WEEKS. - - - - - - - SEPTEMBER 1st to 19th.

The Soil Products of this great State will be a leading feature.

The Mechanical Display will be as attractive as usual, and made up of live exhibits of machinery and neat designs of goods.

The Live Stock will form a most important division of this season's exhibit; competitive tests will be held among the various dairy and beef breeds of cattle.

The Poultry Exhibit will form one of the most interesting features of the Fair.

The Racing Programme will be of unusual excellence, inviting contests between the highest class of horses.

The Exposition Building will be a blaze of electricity, affording every advantage for the exhibition of all kinds of articles.

Electric Motive Power generated at Folsom, twenty-two miles distant, will turn every wheel and furnish brilliant lights for the entire exhibition. Space, power and light furnished free to all exhibitors.

The Mining Interest will be represented by an exhibit of ores and a series of rock-drilling contests, showing accuracy and dispatch in this kind of work.

Cassasa's Great Exposition Band will give high-class concerts at the Pavilion each evening.

The Manufactures of California can meet the consumer to a better advantage at the State Fair, by reason of its varied attractions, than at any other public gathering in the State. Exhibit your goods and let the people know what is made at home.

Free transportation for exhibits and reduced rates of fare will be given on all railroads. Address the Secretary for information of any character Premium lists now ready.

EDWIN F. SMITH, Secretary. C. M. CHASE, President.

Commercial Paragraphs.

THE Edward P. Allis Company have a $45,000 contract to furnish all the machinery for the chlorination works at Colorado City, Col.

THE new Huntington Roller Quartz mill was given a test at the works of the Fulton Engineering and Shipbuilding Co. this week, with satisfactory results. The mill will be on exhibition at the Mechanics' Fair next month.

TWO "Woodbury" Concentrators shipped to Australia by the last steamer, added to eight shipped on the steamer before is a good showing for one month, and speaks well for the reputation of California machinery among practical mining men of the Antipodes.

ADAM SCHILLING & SONS shipped on the 1st inst. one 12 H. P. Golden Gate gas engine hoisting plant for use in the Rose mine, near Victor, San Bernardino county. This hoist will be placed 300 feet under ground, and is to hoist 1000 pounds 500 feet at the rate of 110 feet a minute.

A TRUAX SILVER STATE ORE CAR was received by Iunker Bros. last Sunday, for Humphreys & Quigley, to be used at the Commodore mine on Barkhouse creek. The car is one of the latest patents, and the ore can be dumped wherever they please with it. It is made entirely of iron and is the strongest and most convenient car made.—Yreka Journal.

MANAGER GRAHAM of the Vulcan Iron Works, which recently suffered a temporary derangement by fire, has secured premises at the corner of Francisco and Kearny streets, this city, where the Vulcan Iron Works are now in running order and prepared to do a general foundry and machine business. The office is corner First and Mission streets.

THE Penberthy Injector Company of Detroit, Mich., celebrated on July 25th the manufacture and sale of 100,000 Penberthy injectors. The first Penberthy injector was made by this firm on June 5, 1886, and was numbered "No. 1." No. 100,000 was made on May 12, 1896, so that in a little less than ten years 100,000 of these devices have been turned out and sold.

THE Pelton Water Wheel Company has a contract for the hydraulic work of the new power station of the Central California Electric Company, Newcastle, Cal. There will be two pairs of 48-inch Pelton wheels mounted on a cast-iron base, direct connected with Westinghouse generators, the wheels having a capacity of 1200 H. P. running under 420 ft. head at 400 revolutions. The power transmitted will be 28 miles to Sacramento.

THE Jeffrey Manufacturing Company of Columbus, Ohio, have taken up the manufacture of the Robinson patented coal washing machinery. There are many in daily use in this and foreign countries, and it is conceded to be a most efficient and simple washer. Points of special advantage are its simplicity, compactness, low cost of installation, low cost of operation, economy in the use of water and its washing of coal that is not closely sized. For catalogues address the above company.

IN contrast with the dullness reported in that vicinity, is the unusual activity displayed at the works of the Link Belt Machinery Co., Chicago, who have been operating their machine shop with two gangs of men both day and night during the past three months. The foundry, as well, is being worked to its limit, one order for castings alone requiring 987,000 pounds of iron. A notable order is that for furnishing the Chicago Sugar Refinery with a complete equipment of machinery for handling coal from cars to iron bins located over 25 B. & W. boilers in power house—from bins whose storage capacity is 650 tons. The coal is spouted directly on to chain grates in boilers. An order for the Huron Iron Co., Mich., for two 8-foot spirally grooved hoisting drums, together with 11½-inch by 25-foot shaft, friction clutches, base plates, etc., and brake bands, for running the drums independent of each other, etc., both for hoisting and lowering, is nearing completion. The two friction clutches and brake bands are so arranged that they can be operated by one man, without moving from one place to another, the operating mechanism being brought to center of frame.

FOR SALE.

4,000 Feet 3-in. 4-in. and 6-in. Pipe, suitable for mines, irrigation, or village water works system. W. F. THOMPSON, 40 Main Street, S. F.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

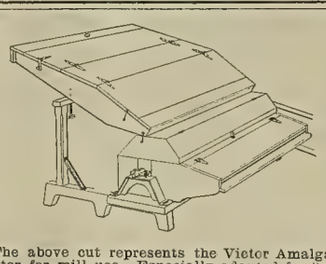
QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., 145 and 147 Beale St., S. F.

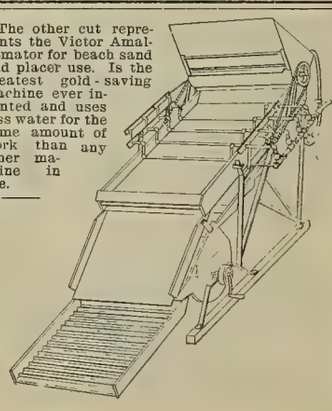


The above cut represents the Victor Amalgamator for mill use. Especially adapted for fine gold and slimey ores. It will positively save 95 per cent of all free gold, no matter how fine.

Send for catalogue. Manufactured only by the

VICTOR AMALGAMATOR CO.,
703 S. Main Street, Los Angeles, Cal.

The other cut represents the Victor Amalgamator for beach sand and placer use. Is the greatest gold-saving machine ever invented and uses less water for the same amount of work than any other machine in use.



Coast Industrial Notes.

—At a depth of 2000 feet a big flow of natural gas has been struck at Stockton, Cal.

—The Astoria Iron Works, Astoria, Oregon, recently turned out the biggest casting ever made in Clatsop Co.

—An order for 5,000,000 feet of fir lumber for an European dry dock has been secured by the Port Blakeley, Wash., mill through the Pine Lumber Company of San Francisco.

—The new Northern Pacific tariff on canned salmon went into effect yesterday. The rates from North Pacific coast terminals are 65 cents to New York, Philadelphia and Baltimore and 67 cents to Boston.

—The Northern Pacific Steamship Company has announced a new rate of $6 a ton on flour from Tacoma to Hongkong, Yokohama and the Orient. This is $6 in Mexican money, and amounts to $3 24 in gold. The prior rate was $2 Mexican, which has been in effect during the last nine months. The rate was $4 the preceding year, and $6 before then.

The following is a translation from *El Comercio*, of Lima, May 16, 1896, and is commended to the attention of our San Francisco merchants: During the week ending to-day, the first vessel of the West Coast Line, inaugurating steam traffic between New York and the principal ports of Chile and Peru, left Callao on her return voyage to New York. Until the present time, this company has carried on trade with sailing vessels, but it proposes henceforth to send out a cargo steamer regularly every two months from New York to Callao. It has been two years since the New York and Pacific Steamship Company, better known as the Merchants' Line, opened a regular steamship trade between New York and the principal ports on the Pacific coast of South America, and now comes a competing campany to divide the proceeds of this trade and to afford to these countries a new line of communication with the United States. We could cite but few examples that would more conclusively demonstrate the powerful influence which steam exercises in promoting trade than that given by the latter company in opening a route practically creating a new direct communication with the eastern part of the United States. In starting, it had but three vessels, but later, it sent out a vessel every forty days. Now, it has five and the departures are every twenty-five days. This is not all that is notable in estimating the accruing benefits. Prior to the existence of this line of steamers, our trade with the United States had to go by the Panama route, where it was subjected to the overcharges and burdens occasioned by this reshipment through the Isthmus. The freight from all our ports, per ton of 2,000 pounds, was $25 for ores and coffee, $48 for coca, $35 for common wool, $40 for alpaca, and $22 and $25, respectively, for the goatskins and cotton shipped from Paita. It will be readily seen that with freights ranging from £5 to £6 per English ton, it was impossible for our trade with the United States to acquire any importance. Consequently, the shipments were confined to some cotton from Piura, some skins and hides, and a few bales of coca leaves and sacks of coffee. This forced the mercantile interests in the United States to go to Liverpool for the products of Peru, such as the fine wools required to mix with others in the manufacture of certain textures, the thought of importing directly from Peru being unrealizable. Now that freights on wools have been reduced to £3 5s., with a likelihood that the competition will bring still greater reductions, direct shipments to the United States have become important, particularly since ordinary wools realize one penny more there than on the Liverpool market. It will be observed that the simple reduction of freights, caused by the establishment of a regular line of steamers, has opened a new and better market for the principal products of this country. For the same reason, our national mining industry has been equally benefited. The crude ores that used to pay £5 1s 2d now pay but £1 1s 2d, and the quantities going directly to the North American smelting works are considerable. The cottons from Ica, that were exported exclusively to England and France, go likewise to New York. The shipment of coffee and coca to the United States, with freights reduced to £3 1s 4d and £3 1s 2d, are growing in importance. The same may be said of the cotton and goatskins from Paita, which now pay £2 less per ton. Shipments of cacao, cascarilla, and balsams have also commenced, and with a regularity equal to the departure of steamers from the port of Mollendo, lots of caoutchouc from the mountains of Sandia, Cuzco, and the Madre de Dios are going the same way. But a few months have sufficed to produce this important evolution in our commercial system and to divert a goodly part of Peruvian products from the old route to Europe to the new one to the United States—a nation with which, for various reasons, it is advisable for us to extend our commercial and friendly relations. It is rational to presume that similar changes will be experienced in the export trade from New York to Peru, owing to the existence of the two navigation companies referred to, and that the original mode of sending merchandise from New York to Peru by way of Liverpool will be abandoned—which, though it crossed the Atlantic twice, paid less freight than by former direct shipments from the United States to Peru. With reference to the last official commission created by the United States to investigate and report upon the best means to promote commercial intercourse between that Republic and those of South America, we expressed the opinion that the objects in view could only be attained by the establishment of a steamship line that would offer cheaper freights for the exportation of Peruvian products to the great markets of the United States. Governed as they are by cable, the actual needs of commerce require regular steam service, as they can no longer be met by sailing vessels. Lower rates of interest, lower insurance, the arrival and departure of merchandise at precise dates, are advantages indispensable to commerce which steam alone gives and which go practically to reduce freights. In view of the favorable results which have already flowed from the establishment of the Merchants' Line, it would be advisable to think about establishing other lines between the United States and Peru. The most useful, perhaps, would be a line between San Francisco, Valparaiso, and intermediate ports of the west coast of South America and another from New York or New Orleans to the Amazonian region of Peru. Mr. Jastremski, the American consul at Callao, has called the attention of his Government to the first route, for the benefit particularly of the wheat growers of the Pacific States of the great northern Republic. Indeed, the importation of wheat and flour to this country fluctuates annually from 35,000 to 40,000 tons, and well might this volume of breadstuffs give material assistance to the traffic between the States referred to and our own country. With reference to the second route, we may assert that the commerce of the Amazonian region of Peru is increasing daily. Nearly all the carrying trade there is in the hands of the powerful English navigation company, which, with its sixty steamers of various dimensions, maintains, without reshipments, a traffic between Liverpool and Manaos. The readers of *El Comercio* have been informed in this connection that Mr. Charles Mouraille has recently inaugurated, with the steamer *Huascar*, a new line between Havre and Iquitos. Our Government can not fail to perceive the influence that the development of the resources of its Amazonian regions will exercise in the economic progress of the country, and we assume that the Government will endeavor to induce that of the United States to lend its powerful aid in the formation of a steamship company that will establish regular communication between the eastern ports of the great republic and the ports of the deep, virgin tributaries of the Amazon. It can not be doubted that the profits of such an enterprise would go on increasing proportionately with the increasing extraction of the immense quantities of rich products which are lost for the mere want of transportation to the markets where they command the good prices awaiting them.

Personal.

NAYLOR WILLIAMS has resigned as superintendent of the Madison mine, Calaveras Co., and will occupy a similar position at the Jones mine, Carson Creek, Cal.

THE *Mining Investor* says T. W. Goad has resigned the active management of the Gold and Silver Extraction Company of America, his resignation to take effect on Sept. 1st. Mr. Goad has been in Colorado for seventeen years, was prominently connected with early mining operations at Leadville and other parts of the State,

Obituary.

SIR WILLIAM GROVE, the famous scientist and electrician, died in London last Saturday, aged 85. Sixty years ago he turned his attention to the study of electricity, and in 1839 first constructed the voltaic battery which bears his name. He was one of the first, if not the first, to fully develop and clearly demonstrate the now generally accepted scientific doctrine of the correlation of forces.

Recently Declared Mining Dividends.

Quincy Copper Mining Company, Mich., $6 per share, $300,000, Aug. 17th.

Alaska-Mexican mine, quarterly dividend $18,000, Aug. 1st.

Alaska-Treadwell mine, a quarterly dividend of 37½c. per share, $75,000, Aug. 1st.

Osceola Copper Mining Company, Mich., $1 per share, $50,000, July 25th.

Homestake Mining Company, 25c per share, July 25th.

Ontario Mining Company, Utah, $15,000, Aug. 7th.

"HERCULES" MINING HOISTS.

In ordering a new 10-horse power Hoist the Texas Consolidated Gold Mining Company wrote: "We hope your 10-horse power outfit will be as good in proportion as the 4-horse power we now have; the latter can't be beat. We hoist 700 pounds 150 feet out of a perpendicular shaft, 30 to 35 tons in ten hours."

Please permit us to express our entire satisfaction with the 10-horse power Hercules Gasoline Engine and Hoist purchased from you last August. We have worked it for the last three months and find it to do excellent work; likewise the 4-horse power Gasoline Engine purchased some time ago, which is now being used for the lighter work. Yours very truly, TEXAS CON. GOLD MINING CO.

The Manhattan Mining Company now uses three of our Gasoline Engines for pumping on the lower levels at a cost of $9 per day for fuel and labor, as opposed to $36 per day for doing the same work by steam.

The Amalie Mining Company bought a 3-horse power "Baby Hoist" as an experiment, and within six weeks ordered another 6-horse outfit.

The HERCULES GASOLINE ENGINE AND HOIST is the most simple, compact and economical in the market—occupies less space and does more work for less money than any other Hoist.

SEND FOR CATALOGUE.

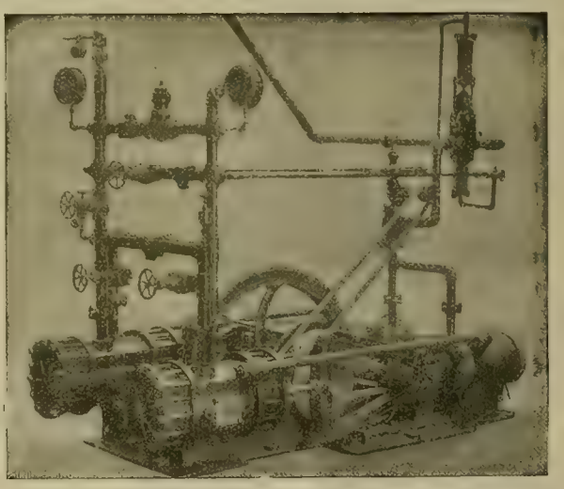
Hercules Gas Engine Works,

Builders of Gas, Oil and Gasoline Engines, from 1 to 200-horse power.

Office, 405 and 407 Sansome Street, - - - - San Francisco, Cal.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.



KENDALL GOLD AND SILVER EXTRACTION CO.

THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.

Owners of mines and reduction works can obtain full information on application to

KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

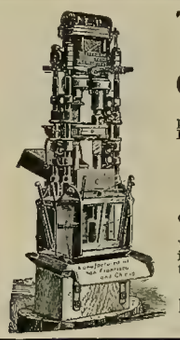
AIDION ANTI-FRICTION BABBITT METAL.
Superior to Any Anti-Friction Babbitt Metal on the Market.
——USED FOR——
High Speed Engines, Dynamos, Rolling-Mills, Steamships, Railroads, Saw-Mills, Cotton-Mills, Paper-Mills, Woolen-Mills, Silk-Mills, Jute-Mills, Rubber-Mills, Sugar-Mills, and all Machinery Bearings.
Gray's Harbor Commercial Co., Cosmopolis, Wash., state:
"We have never used any other than AIDION since we have carried same in stock, and further, that we have babbitted up the 'Thrust Box' on one of our steamers, where nearly every other kind of Babbitt had been used. In every case it had been unsatisfactory, but since putting in the AIDION we have had no trouble in any way whatever."
K. J. McHUGH, Successor to the Adkins Manufacturing Co.
35 NEW MONTGOMERY STREET, SAN FRANCISCO, CAL.



Tremain Steam Ore Stamp.
COMPLETE FREE-MILLING PLANT FOR $1,000.
Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.
Total Weight, About 5000 Pounds.
It requires no belting, shafting, pulleys or building.
Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.
Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

1607-8 Manhattan Building, Chicago, Illinois.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

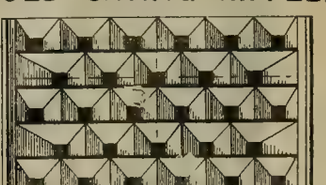
PAYNE'S

PATENTED

GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

1710 Champa Street, DENVER, COLORADO.

☞Would sell an interest to right party.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

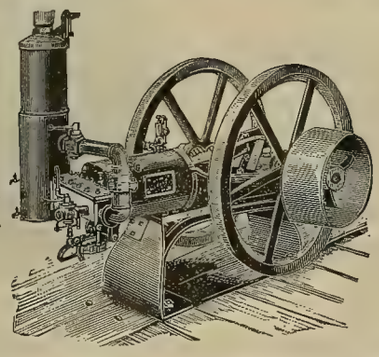
CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY



BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to aminimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 6, 1896.

Business continues good in all branches of trade. The relative low prices ruling for goods and small margin of profits under close competition are against jobbers. There is a continued growing interest in gold mining. It is the accepted opinion that this fall more money will find investment in gold mines than was put into it at the corresponding time in 1895. The silver agitation with gold still commanding premium in Austria-Hungary and two or three other European countries, will naturally create a desire for investment in gold mines on a paying basis. While there are a good many properties offering in this city for sale, there are very few that are sufficiently developed to invite buyers outside of those willing to take chances on the prospects.

In the local money market there is nothing new to report. The banks state that the usual accommodations are extended to regular patrons, while others having first class security can secure loans. All dealings are on a gold basis which is no different from that which has been in vogue on this coast for thirty years. Merchants report that collections are made with more ease than for several years past. This is due to the retail trade not stocking up much, only buying in a hand-to-mouth way and also the general activity in gold mining districts and lumbering camps on this coast. At the East money is reported fairly firm and borrowers having first class securites to offer being quickly accommodated. The suspension of a large speculating firm at Chicago, identified with two leading industries has had an unfavorable effect there, but which, it is stated, will be only temporary in character. Securities, cereals and provisions at the East are feeling the effects of lower prices ruling to-day.

New York Silver Prices.

NEW YORK, Aug. 6.—Following are the closing prices for the week:

	—Silver in— London.	N. Y.
Friday	31⅞	68⅝
Saturday	31⅞	68⅝
Monday	31⅞	68⅝
Tuesday	31⅞	68⅝
Wednesday	31⅞	68⅝
Thursday	31⅞	68⅛

	Copper.	Lead.	Iron.	Tin.
Friday	10 75	2 85	10 25@12 50	13 40
Saturday	10 75	2 85	10 25@12 50	13 40
Monday	11 25	2 90	10 25@12 50	13 40
Tuesday	11 05	2 85	10 25@12 50	13 40
Wednesday	11 00	2 85	10 25@12 50	13 40

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	.5
New York Telegraphic Transfer	.7½
London Bankers' 60 days	$4.88
London Merchants	$4.86¼
London Sight Bankers	$4.89¾
Refined Silver, per oz., 1000 fine	68½
Mexican Dollars	53¾@54½c

All exchanges are nominal.

SILVER.—The market has held dull but steady up to this morning when it shaded off slightly in sympathy with lower prices at the East. Notwithstanding Eastern exporters claimed that European markets did not justify shipping, still the quantity that has gone out from New York to Europe has footed up quite large each week. There are no indication free shipments setting in soon for the Orient; evidently foreigners do not take much stock in the free coinage agitation in this country, or else there would be buying for speculation.

MEXICAN DOLLARS.—The market is quiet and easy. There is only light inquiry for export.

COPPER.—The market has been fairly steady in this city, but at the East it fluctuated slightly. The consumption in this country is still not up to expectation, but in Europe it is continued on a liberal scale. Stocks there are comparatively light., and are said to be steadily drawn notwithstanding the heavy imports. With this the case it would seem as if prices ought to appreciate unless copper producers fear a falling off in the demand with no corresponding decrease in production.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—There is a higher domestic call, but for export to Mexico there is a continued free movement. The last steamer leaving for Mexican ports took out 342 flasks.

The market is quoted as follows:

Home trade, per flask	37 00
Distant points up north	36 25@37 00
West coast of Mexico, for export	34 50

ANTIMONY.—The demand is fair with the market steady at 7¾@8¼c in a jobbing way. New York mail advices quote 7⅜@7½c for Cookson's, 6½c for Hallett's and 6½c for Japanese, from store.

LEAD.—The demand is still slow from corrodres owing to a liberal supply of foreign. For shot making purposes the demand will set in soon.

Pig	3 75	@	4 00
Bar	—	@	4 15
Sheet	—	@	5 50
Pipe	—	@	4 75

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—For both pig and plate there is a light inquiry.

Pig, per lb	14½c
Plate, I C coke, heavy, per box	$4 25
" " " light, "	4 10

BORAX.—The market is quoted as follows

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	6⅛
Concentrated, "	5⅝

POWDER.—The call for mining purposes very heavy, fully 20 to 30 per cent more than at this time last year.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON. — Our market is practically unchanged. Eastern advices state that for this season of the year there is a fair inquiry, with several large orders placed for rails. It is expected that by November renewed activity will set in.

COAL.—There is nothing new to report in our market for spot, to arrive or for shipment.

SPOT FROM YARD—PER TON.

Wellington	$7 50	@	8 00
Greta	6 00	@	6 50
Nanaimo	6 50	@	7 00

Brymbo	—	@	7 50

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	—
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	—		—
English, to load	8 00	@	—
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	—
Cumberland	—	@	—

LUMBER.—Advices from Puget Sound continue to report a good export movement, although not up to what ruled last year at this time. The home demand is quiet.

The market is quoted in this city from dock or yards as follows:

Redwood, Fluming	17 00	@	—
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The consumption continues fair, but the trade do not anticipate their wants, fearing lower prices.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Aug. 6, 1896.

Chollar continued the leader the past week. It sold at $3.05 on regular call last Friday, on Monday at $2.25, the next day up to $2.65 and yesterday down to $2.45. The rest of the market moved in sympathy, with business confined largely to shares of the Comstock mines having ground on the Brunswick lode. Two weeks ago, when Chollar sold at $1.80, the Gold Hill shares were higher than yesterday, with Chollar selling around to $2 50, but the north end shares sold slightly higher than two weeks ago and the other middle shares about 10 per cent better. The depression in the Gold Hill shares is said to be due to the management being desirous of freezing holders out of certain desirable shares. This can be done the better by not giving them support and also by putting on assessments. But the Gold Hill mines are not the only ones to be assessed, for, if reports be correct, several are pending by the north end mining companies; but the management of these mines seem to give better support to the market value of the shares. There is no denying that the general trading public are not paying much attention to the market. With them there seems to be a feeling that prices must go lower before there is much in the market, and, having settled to this belief, they are rather indifferent as to the way in which it is being manipulated, notwithstanding there have been strong buyers. Experience has taught that the latter can buy and then send prices down before an upmove of a pronounced character, and it is this knowledge that makes the average trader shy, particularly with values being worked largely on a gambling basis, for at present the ore development on the Brunswick lode is not sufficiently large to justify higher prices than now rules for shares of the Comstock mines working on that lode. It is a game that no one should play at that can not afford to lose what money he puts in if the prospects do not come up to expectations. Shrewd operators say that, if there is no large ore development, it will be hard to sell the shares and prices must go down; but, on the other hand, if expectations should be realized, then the manipulators will not want to do much in the market towards higher prices until they have frozen outside holders out of their shares. By this reasoning, it seems to be largely a case of tossing up a coin, with heads insiders win and tails outsiders lose.

The following mining companies report having had balances on hand August 1st, 1896, as per sworn statements filed in their offices today: Andes $11,538.75, Alpha Con. $1547.37, Alta $5455.29, Best & Belcher $1050.72, Bullion $3626.21, Bodie Con. $4193.92, Bulwer Con. $7641.31, Caledonia $4462.65, Con. New York $1934.88, Crown Point $5689.85, Con. Cal. & Va. $26,599.47, Chollar $24,089.24, Confidence $8817.94, Church $9528.94, Challenge Con. $858.86, Con. Imperial $287.33, East Sierra Nevada 48 cents, Exchequer $981.99, Gould & Curry $2930.92, Julia Con. $296.94, Kentuck Con. $2470.31, Lady Washington $90.32, Mexican $11,282.53, Mono $2895.78, Ophir $4077.96, Overman $9748.45 Occidental Con. $3801.92, Potosi $9349.65, Seg. Belcher, $4345.46, Scorpion $1332.98, Syndicate $607.77, Standard Con. $13,262.47, Savage $11,526.79, Sierra Nevada $4380.25, Silver King $2764.21, Summit $41.50, Silver Hill $1332.45, Union Con. $4556.66, Utah Con. $1878.86. The following companies report having had an indebtedness August 1st, 1896: Belcher $352.10, Hale & Norcross $3142.99.

From the Comstock mines our advices continue to report exploiting work in Alta, but no work in the other Devil Gate mines. In the Gold Hill mines, so far as we are advised, work has not been resumed in Caledonia. In Overman they are raising a few tons of ore while prosecuting work. Seg. Belcher and Belcher continue to extract and raise some ore each week, but not enough to cut any figure. As to the work that is being done in these two mines the official letters remain discreetly silent. In Crown Point they continue to work on the 600-foot, 700-foot and 1100-foot levels. From the latter level 200 tons of ore has been extracted and when a sufficient quantity has been raised a test run will be made. Work has not been resumed, so far as we are advised, in Kentuck, but a 5-cent assessment is being collected. It is reported that two miners are at work in Yellow Jacket, but what they are doing outsiders are not advised. In Confidence air connection has been made which will admit of active exploiting work in that mine and Challenge. Work is continued in the joint Confidence, Challenge and Con. Imperial cross-drift and also in cross-drift No. 3 in the latter mine. In Alpha the work is still on the 500-foot level. They have been fully three years trying to find the ore reported about four or five years ago. It may take two or three more assessments before their efforts are crowned by success. No change is reported in the work in Bullion. In Potosi they are working on the 450-foot level, with no material change reported. They are at work in the same level in Chollar. The latter mine raises each week over 100 tons of fair grade ore. It assays over $20 a ton. No change is reported in the work of Gould & Curry and Best & Belcher. Con. Virginia's official letter reports work on the 1000-foot, 1650-foot and 1750-foot levels. While the general formation is favorable in the 1000-foot level, nothing of value has as yet been found. They raised last week 157 tons of ore from the 1750-foot level, which assayed around $50. How long this ore will hold out is hard to say. Work is continued on the central tunnel and 1000-foot levels in Ophir. No material change is reported. In Mexican work is still being pushed on the 1000-foot level. In Sierra Nevada, Union, Utah and Andes no change is reported. In Utah they have put in an air blower for ventilation to facilitate work.

From the Brunswick lode our advices are to the effect that Occidental is milling some ore. The work in this mine is on the same levels heretofore reported, with no essential change reported in the material encountered or formation of the ground. In Chollar it was expected that two crossdrifts would be started this week so as to strike the downward continuation of the ore above. We are not advised that when this is done if they will crosscut the ledge to find its width. This work attracts considerable attention. It is expected that the ore vein will be found to be wider and richer than that on the 200-foot level. In Hale & Norcross they are working on the 300-foot level and also sinking a winze to the 400-foot level. In Savage, Gold & Curry, Best & Belcher and Con. Virginia the work is the same as heretofore reported by us. That in Gould & Curry is being closely watched by mining men.

From the Bodie district our advices are essentially unchanged. Work is continued on several levels in Mono, Standard, Bulwer and Bodie. The three latter are raising a few tons of ore each week, but not sufficient to meet current expenses.

The market opened this morning dull and barely steady at last night's closing bids. After Call there was a slightly firmer feeling which soon gave way under cross-orders for lower prices. Chollar closed at $2.35 at noon; Potosi at $1.05. The shares of the north end mines held fairly steady, as did those of the Gold Hill mines. The points are out for still lower figures on Chollar. Reliable advices received to-day from the Brunswick lode state that in running the south drift on the 300-foot level, they ran into and out of the ore at several points and as they went south the ore widened and gained in value. At one point it was six feet wide with an average assay value of $60 to the ton. This is a large increase in width and value on that found on the 200-foot level, and makes mining men outspoken in the belief that it is proving to be a mine. The vein runs in a zigzag way, while the drift is run straight. After the drift has been extended still further, crosscutting will be commenced. If the ore gains on the 400-foot level as it gained on the 300-foot level over the 200-foot level, then they have a large ore body which ought to return dividends if properly handled; even as it is, the showing is most gratifying.

The following illustrates the changes of the week:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 28, 1896.

564,818.—SEWING MACHINE—F. M. Batchelor, Portland, Or.
564,955.—TROLLEY WHEELS—Brunswick & Johnson, Los Angeles, Cal.
564,737.—IGNITER FOR GAS ENGINE—T. G. Cantrell, S. F.
564,509.—CAR FENDER—P. P. Donahoo, S. F.
564,905.—FRUIT HOLDER—T. S. Fitch, S. F.
564,750.—NUT LOCK—J. C. Holloway, S. F.
564,823.—BOTTLE CLOSURE—W. Laudahn, Port Angeles, Wash.
564,827.—CAR FENDER—P. E. Law, Santa Barbara, Cal.
564,897.—PUMP—F. Orton, S. F.
564,769.—GAS ENGINE—H. Swain, S. F.
564,851.—CAR AXLE BOX—A. A. Weber, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

NUT-LOCK—James C. Holloway of San Francisco, Cal. No. 564,750. Dated July 28, 1896. This nut-lock consists of a sheet of metal having wings provided with integral supplemental lugs on opposite sides, said wings and lugs being cut from within and out of the body of the blank and contained within the outer wall or edge thereof, the wings being adapted to be bent to engage two of the side walls of the nut and said lugs are to be bent horizontally at right angles to the wings to engage the other side walls of the nut.

IGNITER FOR EXPLOSIVE-ENGINES.—Thomas G. Cantrell of San Francisco, Cal. No. 564,737. Dated July 28, 1896. The object of this device is to provide such connections for the yielding rigid electrode that will not be subjected to injurious influences but may be wholly outside of the cylinder and within reach, and even within sight, so that their operation may always be observed. To this end the device consists in connection with a rigid electrode, a grooved foot in which it is adjustably fitted, a stem carrying the foot and passing outside of the cylinder, a flat faced lug upon said stem outside of the cylinder, a laterly projecting sliding pin, having a head in contact with the flat faced lug, and a spring impinging against the end of the pin, to hold its head in contact with the lug.

CAPT. GILLETTE has sent the annual report of the California Debris Commission to the War Department at Washington, D. C. He reports that owing to the lack of funds the commission was able to carry on only a small part of its duties from January 31, 1896, to the close of the fiscal year. In accordance with the opinion of the Attorney-General, the commission has, since the date of its last annual report, called the attention of the owners and operators of thirteen mines which were being worked illegally to the requirements of the law and the duties of the commission in the matter. So far as known these mines have been closed, and in two cases applications have subsequently been made to the commission for permits to mine. No report has been received from the United States District Attorney as to the progress of the injunction suit requested by the commission on December 4, 1894, against the North Bloomfield Mining Company. Since the organization of the commission 224 applications to mine have been received. Of these, 160 permits to mine have been granted, four permits have been canceled and twenty-five permits at different times suspended temporarily, generally on account of the owners neglecting to comply with the instructions concerning impounding works or from accidents to those works. Several dams or impounding works have been broken or otherwise damaged, but with one exception only small quantities of material escaped in the navigable streams. This was the dam of the Omega mine in Scotchman's creek, Nevada county, which broke owing to the caving in of an old wooden shaft built before the dam authorized by the commission was constructed. Its breaking permitted the escape of about 1,000,000 cubic yards of material impounded some years ago, and upon which an authorized dam had been constructed. The total amount of material mined under permits during the year is estimated at 915,372 cubic yards. The available storage provided at present and partially or wholly completed for future operations is estimated at 8,000,000 cubic yards. No dam for impounding detritus in larger streams has as yet been authorized by the commission. Owing to lack of funds the commission has not yet been able to give any attention to the subject of the improvement of rivers, but with the funds now available they expect to make the necessary examinations to determine if there is any feasible project for the improvement of rivers compatible with the permission of hydraulic mining. It is expected that the funds now available will permit of this work and also to carry on the ordinary work of the commission to the close of the fiscal year ending June 30, 1897.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Walter Shackleford, in the Jack's Ranch Mine, near Meadow Valley, Plumas Co., to deposit tailings in an old pit; from J. F. Cowdery, in the Sacket's Gulch Claim, near St. Louis, Sierra Co., to deposit tailings in a ravine; and from Cadematori & Peirano, in the Barnhardt Mine, near San Andreas, Calaveras Co., to deposit tailings in Grub Gulch, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on August 24th, 1896, at 1:30 P. M.

Assessment Notices.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of July, 1896, an assessment (No. 4) of Two cents (2c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of August, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 21st day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, Room 38, Crocker Building, San Francisco, California.

CONSOLIDATED IMPERIAL MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 24th day of July, 1896, an assessment (No. 37) of One (1c) Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 35, third floor Mills Building, corner of Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of August, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 22d day of September, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. MCCOY, Secretary.

Office—Room 35, Third Floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

BELCHER SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of August, 1896, an assessment (No. 53) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 37, third floor, Mills Building, N. E. corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 30th day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. PERKINS, Secretary.

Office—Room 37, third floor, Mills Building, N. E. corner Bush and Montgomery streets, San Francisco, California.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Western Branch, Denver, Colo.

THE JEFFREY MFG. CO., Columbus, Ohio.
Send for Catalogue. 163 Washington St., New York.

DEWEY & CO'S Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

RISDON IRON WORKS.

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO. { SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY. { EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY. { EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY. { S. BAMBERGER, President and Manager. SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO. { C. C. McIVER, President; D. CUSHMAN, Secretary. MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

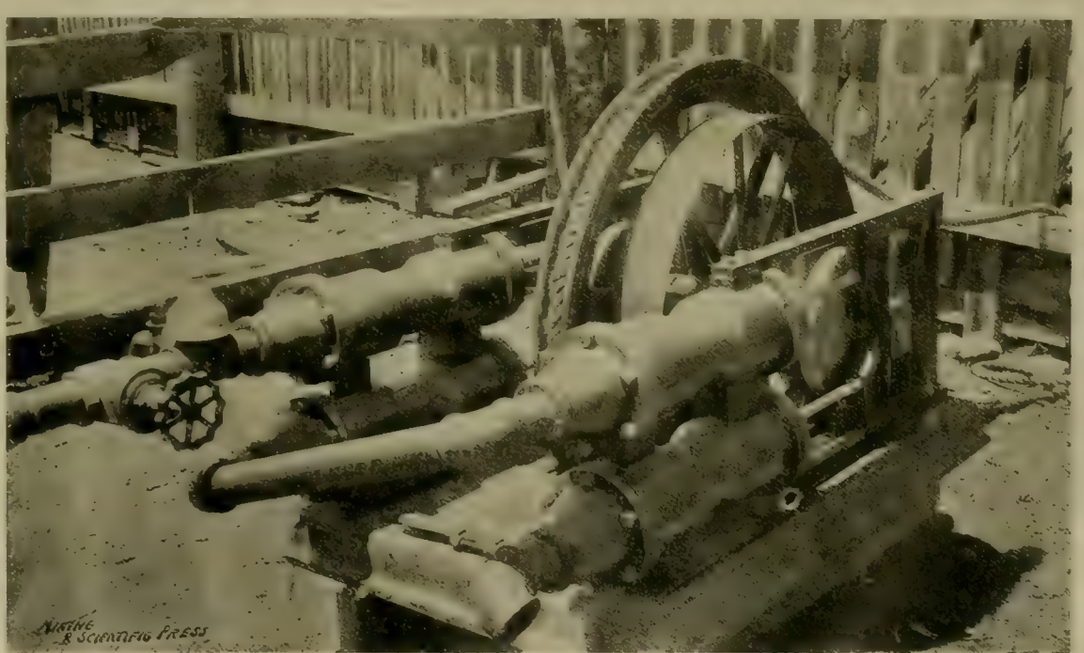
Something New in Water Power.

The accompanying cut represents a hydraulic engine invented and patented by Dr. A. J. Collar of Yreka, California. It is believed to be an entirely new method of working water in cylinders for the purpose of generating power. It has neither cutoffs nor slides, but takes water through the cylinders in an unbroken column, and is provided with pistons intended to apply the force of the water directly to the crank pins when they are near their quarter, or perpendicular, position, and divides the circle described by the crank pin equally between the four pistons. The one crank pin following another at 90°, the same as a locomotive, and the pistons being free from pressure for 45° each side the dead center, the evils of a dead center are considered to be avoided. The positions of the cylinders are such that the thrust of the piston rod is always in nearly a direct line with the crank pin when each piston is at work. When the engine is once filled with water there is no vacuum formed about any of the pistons, and no loss of water in avoiding the dead center (something unavoidable in using a cutoff engine with water as the motive power). Each piston is furnished with a valve in its center, which opens toward the current and is thrown open when the valve pin comes in contact with the down-current end of the cylinder, and is closed when its pin comes in contact with the up-current end of the cylinder, while a small snap holds the valve in position last taken. The cylinders have a brass lining and the pistons a metal packing ring, which can be renewed when worn. The crank pins are furnished each with a block which works up and down in the slot in the crosshead on rows of steel balls, making a joint with less friction than connecting rods would make. This machine is claimed by the inventor to show greater efficiency than any water-using device known. They are especially adapted to hoisting, as water need only be used when raising the load. A throttle reverses the engine, and when reversed the throttle is closed, closing both feed and discharge, when the cage or bucket descends at a speed according to the will of the operator without using any water, but taking advantage of the dead water in the cylinders as a water break. These engines run backward as well as forward. A point of value in these machines, where small ones are to be used in upstair shops and offices, is the efficiency of the discharge pipe when carried down to the sewer; the suction of the discharge-pipe makes the engine as efficient as though placed in the basement. The same holds true with the discharge pipe in all large engines where the pipe can be carried down a few feet below the location of the engine. As these machines allow no water to escape when stopped from any cause, they should be valuable for pumping water from mine shafts or wells, where it can be done by water power. With a float and brake they are self-regulating, pumping water when it is there in sufficient quantity and standing still when there is not enough to require pumping. As the engine uses a given amount of water for each revolution, regardless of pressure, a cyclometer placed on the shaft registers the exact amount used, a valuable consideration to any one purchasing water for power. Their simplicity of construction admits of their manufacture at very reasonable prices. The inventor has two of these engines built, and says they show a remarkable efficiency. One is a 2 H. P. and the other a 15 H. P. The lighter one is built to use 11 inches of water with 70 feet pressure, and the stronger one to use 4 inches of water with 1200 feet pressure. Either one will use a smaller quantity or less pressure to good advantage. One of these engines has a governor of peculiar construction, which it obeys instantly, varying the feed according to the work done, showing them to be well adapted to use under varying amounts of work and able to retain a uniform speed.



A NEW HYDRAULIC ENGINE—A RECENT CALIFORNIA INVENTION.

Home Products Exposition.

In two weeks begins the 29th Industrial Exposition of the Mechanics' Institute of this city, this time under the joint auspices of the Mechanics' Institute and the Manufacturers' and Producers' Association of California. It is worth the attention of every one who recognizes the value of the manufacturing industry to this city and its present untoward condition.

Time was when San Francisco and California had no factories—simply exported and imported. That era passed and a season of activity in manufactures ensued. With the exception of the business of making mining machinery, there is a present general depression in nearly every line. It is not within the limits or the scope of this article to discuss the causes, simply to suggest the great industrial importance of the matter. In the general welfare the amount of business done does not always indicate its value. An importer can do a business of a million dollars a year with three clerks and an office boy; a manufacturer turning out that amount would have a big establishment employing 400 men and supporting 100 families who would buy all they ate and wore, pay rent or taxes, and 90% of the million dollars would be spent in the community. The improved morals of an employed man over an idle one is also a point of some value, not in a religious way, but as an economic proposition. It costs less to run a city whose inhabitants are employed than one infested with enforced idleness. Every dollar spent in fostering home industries comes back multiplied by one hundred, and it is time for Californians to realize this. There is considerable present grumbling about dull times and low prices, and corner orators have voluble statements regarding overproduction and want of consumption, single-tax, the rights and wrongs of the individual. With all this is needed State loyalty, home patriotism, common-sense realization of facts. The surroundings are in every way most favorable; not with the stars, but with ourselves lies the solution of industrial difficulties. This State and coast could be made self-supporting. The matter need not run into politics, as most things do with us. It is purely a business question and the men at the head of the coming exposition have gone at the only common-sense solution of the problem. It is for all concerned to advocate this and practice as well as preach the doctrine of substantially encouraging home production.

Every man who makes any good thing on this coast that he expects to sell should show it at the September exposition in the Mechanics Pavilion. Especially should all industrial and manual trades and handicrafts be represented. There is no charge for exhibition, space, power, steam or water. Awards and cash premiums will be given. The larger success of this matter will be commensurate with the interest displayed by those who are most interested in its success—the people who want to sell what they make to the home market, which is always the best market.

Sale of a Famous Mine.

It is reported that the Mulatos mine, in Mexico, has been sold by the Aguayo brothers to English capitalists, who have been for some time making mill tests and other examinations of the property. This mine attracted the attention of the mining world through the suit brought in 1890 by Hayward & Hobart to recover $1,575,000, the price they had purchased the mine for, on the ground that it had been "salted."

The Mulatos has been examined frequently in the past by Californians. Samuel Fergusen and McGaskill some twelve or fifteen years ago looked at it for J. B. Haggin. A. J. Bowie examined it a little later and then Alexis Janin. Subsequently Alexis Janin and D. B. Gillette went down for the Exploration Company of London. Again, Alexis Janin and D. B. Gillette, aided by Louis Janin Jr. as assayer and surveyor, made a further examination for the same company. As a result of this the property was rejected, but not because of a belief in salting, or with a knowledge of salting, but for reasons not made public. Two years after that—in 1889—Hayward & Hobart were induced to take hold of it, and for the first time work was begun systematically. Hayward's superintendent, Montgomery, an experienced miner, ran the mill, and found that he could get but about $1 per ton from the ore. Before they took hold of it, and after its examination by Gillette and Janin, a cave had covered up most of the best body of ore.

The result of Montgomery's work was so poor that it led to the belief that the mine had been "salted." This was subsequently proved to the satisfaction of Hayward, who took steps to recover his money. He got out with a loss of about $300,000. The mine has lain idle now several years. Recently R. R. Symon, in connection with people in England, took hold of it and had it re-examined by Fred H. Harvey of Galt. His report has not been made public.

This mine undoubtedly has had in the past seams of exceedingly rich ore, and has also lost part of a good body by a cave. The ore-bearing ground is very extensive, but what the value of it is no one seems to know.

With the knowledge of the Treadwell mines in Alaska paying big dividends out of ore carrying $3 per ton, those who have considered the methods believed that with the still cheaper labor that may be obtained in Mexico a big mine could be developed.

This is another case of a big mine that has made a name and cannot be downed. If the Comstock were closed for twenty years it would be opened up again. Old stories of hidden ore bodies and other legends would crop up and grow as the years pass. Prospectors are still hunting for the Pegleg and Gunsight mines, lured on by the tales that loom out of the dim past. Many miners are more willing to heed these mythical stories than listen to the cold-blooded statements of conservative men of what they have seen and know.

Once give a big mine a good name and it never dies. It may be closed down and deserted, but always some one can be found ready to take hold of it for what it has been. The maxim about giving a dog a bad name will not apply. It is fortunate that this is so, or many a bullion producer in California that was worked in early days and then deserted would never have been reopened.

A Supreme Court Decision.

A recent case decided by the Supreme Court of this State has attracted considerable attention. The full text of the decision is given herewith:

FORECLOSURE LIEN FOR LABOR PERFORMED ON A MINING CLAIM.

Appeal from Superior Court of Shasta County.

P. Donohoe, Plaintiff and Respondent,
vs.
The Trinity Consolidated Gold and Silver Mining Company, et als., Defendants; Bank of Shasta County Appellant.

Appeal from the judgment and from the order denying a new trial.

Plaintiff's action was to foreclose a lien for the value of labor performed upon the mining claim of the Trinity Mining Company. The bank was made defendant as claiming some interest in the property, which interest, it was averred and not denied, was subordinate to plaintiff's lien. The mining company suffered default. The bank answered, admitting all of plaintiff's allegations, saving that it denied plaintiff's employment, his labor, its value and non-payment.

The labor, its value, and non-payment, were proved and no question arises upon any of these matters. Plaintiff had alleged that he was employed as a miner by one Bernard McCourt, the duly authorized foreman and agent of the mining company. Upon the trial he undertook to establish this by proving that McCourt was appointed foreman by one Champion, who was the superintendent in charge under authority of the Trinity Consolidated Company. This company it is admitted by the pleadings was incorporated under the laws of the Territory of Utah, with its principal place of business in Ogden. The admissibility and sufficiency of the evidence to establish these agencies of Champion and McCourt are made the contention upon this appeal, presented under objections to the reception of the evidence and also by attacks on the findings based upon it.

The evidence adduced by plaintiff was the following: The plaintiff testified that McCourt employed him. McCourt was acting as foreman, and McCourt himself and Champion, the superintendent, both told him that McCourt was foreman. Champion acted as superintendent and told witness that he was superintendent. He had no other knowledge that Champion had been authorized to act as superintendent by the company. McCourt testified that he was employed to act as foreman by Champion and did so act, with authority to employ and discharge laborers. He employed plaintiff as a miner. Champion was superintendent. Acting as superintendent, he purchased and shipped quartz mill machinery to the mine; caused a 10-stamp mill to be erected and crushed the ore extracted from the mine in this mill. Champion also posted notices about the mine and on the mill to the effect that the Trinity Company was the owner of the property. He knew of Champion's authority only from statements and from his actions as superintendent. James E. Isaacs testified that Champion had repeatedly told him he was managing agent and superintendent of the corporation. He had examined the record of conveyances of property, and of proceedings in a suit against the company brought by the defendant Shasta Bank. This suit was for money had and received. The complaint averred that Champion was the vice-president and managing agent and as such was doing business by authority and direction of the Trinity Company. In this action the Shasta Bank accepted a waiver of the issuance of a summons and an acknowledgment of service of and the amended complaint on behalf of the Trinity Company, defendant therein, from Champion, who described himself "as managing agent and superintendent" of the corporation. And upon this admission entered the default of the mining company, took judgment and sold the property. It is admitted that the Utah company did own the property. There was introducted in evidence the record of a lien filed by Champion against the company for a sum due him for services as superintendent and managing agent. There was introduced records of location of water ditches and rights, and mining claims made by the company through Champion its agent.

Nothing further was established by plaintiff. And the evidence indisputably fails in showing direct authority from the company to Champion, or a direct ratification of Champion's acts. The situation then amounts to this: A foreign corporation owns mines in this State. In its name work is commenced upon these mines. Its so-called superintendent buys costly machinery, constructs a mill, extracts and reduces ore, employs miners, mill men and laborers; takes up water rights and mineral claims; enters into contracts; borrows money; acknowledges service of process in a civil action to collect this money; and in general by word and act holds himself out and conducts himself as the duly and regularly appointed superintendent of the company.

It is unquestionably true that an agency may not generally be established by the declarations and acts of the alleged agent; but without discussing the question whether this evidence would be sufficient to establish an ostensible agency by reason of the failure of the mining corporation to exercise ordinary care (C. C., 2317), it is clear that, under the provisions of our mechanic's lien law, evidence of these acts and declarations is permitted to establish *prima facie* such agency. Section 1183 of the Code of Civil Procedure gives to the miner a lien for labor done at the instance of the owner of the building or his agent; "and every contractor, sub-contractor, architect, builder *or other person* having charge of any mining, or of the construction, alteration, addition to or repair, either in whole or in part, of any building or other improvement, as aforesaid, shall *be held to be the agent* of the owner for purposes of this chapter." These open declarations and continued acts of Champion and McCourt were thus admissible in evidence under this section to show the person in charge of the mining. By the rule of evidence declared by section 1183, this showing, if not dispelled or overcome, *prima facie* established the agency. It is quite true that the owner, or other person in interest, might overthrow this by proof of his want of knowledge and non-employment of the alleged agent, coupled with a showing that he had exercised ordinary care in the premises; but in this case no one seeks to overcome it. The mining company made default, and the bank's claim is also founded upon the sufficiency of the agency of Champion—the very identical agency which, against this miner with a claim of eighty-four dollars for labor, it is disputing and seeking to overthrow.

No counter evidence having been introduced, it follows that the evidence of plaintiff, standing uncontradicted, supports the findings of the court.

The judgment and order appealed from are therefore affirmed. HENSHAW, J.

We concur:
TEMPLE, J.
MCFARLAND, J.

THE apparent requirements in mining enterprises are often of a character not wholly contemplated with satisfaction by peaceably inclined men. On the 30th ult. a meeting of the Matabeleland Development Co. was held in London, England, to discuss the advisability of spending $25,000 in butchering the South African natives. That was not the wording of the resolution, but is its import. The "gun fights" in Nevada, when men reckless of the future but careful of aim got $20 per diem and all expenses to hold sundry mining property, were small affairs in the way of a mining investment compared with the sanguinary appropriation which after some philanthropic discussion was carried by the board of directors of the Matabeleland Development Co. on the 30th ult. "To suppress the revolt in Rhodesia" is what the money is for; it will be turned over to the British South Africa Co. which, among other mining requirements, finds it necessary now and then to exterminate troublesome natives. As a cold-blooded business proposition, the action of the directors was upheld by the manifest exigencies of the occasion. The amusing part of it is the effort to justify the matter in a burst of "patriotism," "manifest destiny," etc. No one said "these vermin infest a country that we have seized and which contains gold that we must have. They oppose us and must be killed." "Divine Providence," "the rights of the conqueror," and the stupidity and intolerable impudence of the natives who objected to the British Company enforcing its assumptive decrees, were referred to as justifying extreme measures. One letter was read beginning "When the company, in the exercise of its undoubted rights as conquerors, called for 45 per cent of the king's cattle, and God, in his inscrutable wisdom, determined upon destroying by rinderpest the remaining 55." Of course, after that there was nothing more to be said. The protests of those who said it was "an enormous butcher's bill" were drowned in a roar of disapprobation and the resolution was passed "by an overwhelming majority." The appropriation will doubtless prove a paying investment.

Concentrates.

AN upward movement in Merced stock is one of the fall probabilities.

THE Carson, Nevada, river is so low that the mills have closed for the season.

CHICAGO merchants are importing Mexican silver dollars and putting them in circulation.

GRAVEL going 8 cents to the pan is being washed out in the principal street of Helena, Montana.

A BOAT propelled by a gasoline engine now runs on the Colorado river from The Needles to El Dorado canyon.

SPOKANE, WASH., will send two carloads of ore, concentrates, specimens, etc., to the St. Paul and Minneapolis exhibition next month.

THE derailment last Sunday of an ore train and a smash-up causes the temporary closing of the Morning mines, in the Cœur d'Alenes, Idaho.

A SCOTCH syndicate has paid $1,500,000 for the Diamond Hill property at Townsend, Montana, and will put an additional 100 stamps in the mill.

A COMBINATION is being formed in Swansea to import and treat Australian sulphide ores by a new patent process, in which sulphate of soda is largely used.

NO ANNUAL REPORT has been issued this year by the State Mining Bureau, and it will be some months before the thirteenth of the series will be published.

LATEST advices from Leadville, Col., report that the strike is still on. The manager of the Bohn mine says he is ready to start at the old wage rate—$2.50 per day.

THE Portland Mining Company at Cripple Creek claims to have the largest hoisting plant in Colorado with a capacity for raising 10,800 pounds of ore 4500 feet per minute.

THE plans and specifications for the Government sampling works to be constructed at Northport, Wash., are ready and bids will shortly be advertised for the letting of the contract.

OF the mining companies registered in British Columbia up to last March three were capitalized at $5,000,000, twenty-three at a million or over and thirty-five at half a million or over.

T. J. MURRAY of Leadville, Colorado, has been in Silver City, N. M., hiring men at $3 per day, and paying their expenses to Leadville to take the places left vacant by striking miners.

SIMONS, MAXWELL AND BAER of Leadville, Colorado, have bought the Ben Shinar mine, Klamath river, near Thompson's creek, Siskiyou Co., Cal., for $15,000, and will build four miles of ditch and flume.

A CONTRACT has been let by the owners of the Gwin mine, Calaveras Co., for the erection of a 40-stamp mill. The new shaft sunk by the present owners has involved an expenditure of nearly $90,000 and is down to a depth of 1300 feet.

THE following advertisement appears in a Redding, Cal., paper: "Placer mine, 2 claims, coarse gold, garden and small orchard well fenced, 200 feet of sluices, mining and other tools, clear title, for sale on account of departure for only $65."

THE new mill for the Golden Gate, Utah, Mining Co., will have a capacity of 400 tons daily, and is expected to cost $200,000. The calculation is that the entire cost of handling the ore, including treatment, will not exceed $2 per ton.

THE tsetse fly of South Africa finds its counterpart in the "gray flies" and "green head" flies at Salmon River and Stanley Basin, Idaho, which kill horses and cattle and have driven all the miners and prospectors out of that region.

THE United States Surveyor General of Washington, advertises for bids for running standard township sections and meander lines on unsurveyed lands in that State. For this purpose $40,000 has been set aside to be expended this year.

THE killed and wounded in the Rand, South Africa, gold mines in '95 aggregated 685; of these 300 were killed. It should not be forgotten, says the South African *Mining Journal*, that the ignorance, stupidity and drunkenness of the natives are responsible for the excessive death rate.

RAYBOLD & GREGORY, of Salt Lake, are trying to rent the old Richmond Smelting Works at Eureka, Nevada, to work some of the gold of that section. Thirty years ago anyone leaving Nevada had to pay a tax of $1 for the privilege. Were that law in force during the last fifteen years the State treasury would have been enriched.

THE coal companies of Alabama have adopted a proposition made by the miners of 40 cents per ton minimum, based on iron at $8.50 per ton, and for every 50 cents advance 2½ cents, until the minimum price of $10.50 is announced, after which 2½ cents on every dollar advance. The contract took effect July 1st and is for one year instead of two years, as heretofore.

A RECENT decision of the California Supreme Court is to the effect that a county recorder could keep the fees paid him for recording mining claims. On page 401 of the session laws of 1891, applying to the class of counties as Kern for instance, is a paragraph saying that the recorder shall keep a record of all mining claims recorded and shall turn the fees received therefor into the county treasury.

PATENTS have been issued by the general land office to the Northern Pacific Railroad Company for 28,019.74 acres of land in Stevens county, Washington. Protests have been filed to cover a number of mining claims located in that vicinity, but the patents are for lands advertised, and not protested. There are, however, mineral claims on these lands on behalf of which the owners had failed to file protests.

RUSSELL HOWLAND, an English mining engineer, is enthusiastic over some Georgia gold property that he has been examining, and says the ore at Tallapoosa and Villa Rica is richer than that of South Africa. He tells of the Georgia "mother lode" called the "Dahlonega belt," and says that it would be profitable to build "a big stamp mill every ten or fifteen miles through Cherokee and Lumpkin counties."

THE director of the mint has prepared a statement that as the full existing mint facilities of the country do not exceed an annual coinage of silver dollars exceeding $40,000,000, fourteen years would be consumed in replacing with silver dollars the $485,000,000 gold in circulation, supposing the latter is drawn away to Europe, as has been predicted would follow the free coinage of silver, and additional minting facilities are not provided.

REFERENCE to the Trinity Co. letter from one of our traveling correspondents indicates what is being done in that section in the way of mining, and is a good answer to the question, "What are you folks doing in California?" The Trinity county miners, besides having good ground to work in common with all California, have an advantage over some placer sections of the State in the fact that they are not vexed or hampered by the anti-debris restriction problem.

ALL the Bonanza King property at Providence was sold last week under execution to J. H. West, Needles, Cal. It included 15,000 tons of tailings, a 20-stamp mill and the King mine. The company at one time placed a valuation of $250,000 on the tailings, but the fall in silver bullion makes them almost valueless at this time. The Bonanza King has produced over $2,000,000 in dividends.

THE Roseburg, Oregon, U. S. land office has instructions from Washington to give notice of hearings in the matter of sixty specific protests filed by mineral-land claimants against the patenting of O. & C. R. R. lands in Jackson and Josephine counties, Or. The evidence will be taken before different officials in the two counties, and the Register and Receiver will then render the decisions.

THE Anti-Debris Association pays its manager $200 per month; has another official who gets $300 per month and so on. No one in the State Miners' Association gets anything for his personal services, some of the hardest workers even paying their own expenses. During the year ending June 30, '96, one of the liveliest county mine associations in the State—Placer Co.—collected and disbursed $822.51, of which $655 was sent to the State Association, all at an expense of $33 60.

CONCERNING numerous samples of asbestos from northern California, Oregon and Washington, local manufacturers and dealers in asbestos goods say that a great quantity is being mined now, and where two years ago they paid from $50 to $60 per ton at the quarries, they can now buy it for $7 or $8 per ton. As a commercial proposition, the quality and extent of the deposit, facility of getting it out and transportation rates would largely determine the feasibility of mining it in all cases.

SOME side lights are furnished on some British mining methods by an editorial warning in the current issue of the London *Mining World*, against the practice of directors in gold mining companies demanding commissions from mining machinery manufacturers, and who refuse to vote for the orderb eing placed with a manufacturer unless they are paid a commission. One London contemporary correctly says: "If mining machinery is to be ordered on 'tips' and not on merits, it is high time investors should know it."

THE hoisting works of the Poulin mine, at Butte, Montana, were destroyed by fire last Sunday, involving a loss of $10,000 and narrowly missing a great loss of life. Six men were at the bottom of the shaft, 1100 feet below the surface, sinking at the time, and a pumpman was at the 1000 foot level. The foreman went down on a cage, gave an alarm and got the six men out. All were drawn to the surface. Just as the cage cleared the opening of the shaft, the men all jumped and landed in safety on the platform. Almost at the same instant the rope burned through and the cage fell to the bottom.

IN U. S. mints an alloy of one-tenth copper is used in coins to harden them and make them less susceptible to abrasion. In England the amount of alloy is less—only one-twelfth. Recently a controversy arose among the mint officials of London as to which coins, English or American, would last the longer. In order to put the matter to a test two small steel cylinders were fixed on a revolving rod and one filled with United States and the other with British coins. All of the letters, milling, reading, etc., were worn from the English coins twelve hours before they were effaced from the American coins.

THE Government has commenced the survey of the Blackfoot reservation in Montana, which the Indians last fall agreed to sell for $1,500,000. The land is said to contain mineral. Legends of rich finds made in years gone by have spread the belief that the strip abounds in gold, silver and copper. As mining legends, like all others, lose nothing in retelling, the large number of prospectors who are now camped on the outskirts of the reservation, waiting for the completion of the survey, may be somewhat disappointed. There is no doubt that copper ledges do exist, and some gold has been found, and altogether the prospects are good for developing a mining district, but hardly as rapidly as the "sooners" expect.

W. A. CARLYLE, geologist for British Columbia, has examined the Trail creek mines, and says between there and the Sudsbury district in Ontario he finds a remarkable similarity, with the exception that there is no nickel in the ores of Trail, while that metal and copper have constituted the value of the former, the nickel more particularly bringing them into prominence. He says he has found the same iron cap over the veins of Trail, the same iron sulphides and copper pyrites. He says that the veins are true, and, while there are great bodies of ore in sight, development of the mines has scarcely commenced. He thinks the country is one of vast possibilities, but a great deal depends upon the method of treating the ore.

A COMPARISON of the wear and tear of shoes and dies shows that at the Homestake, South Dakota, mine shoes wear at the rate of from 36 to 37 pounds per 100 tons of ore, and the dies at the rate of 44 to 48 pounds. This represents a cost of about 2 cents per ton, at the prices which the Homestake company pays, as compared to 4 cents at Angels Camp, 5½ cents in Gilpin county, Colorado, 4½ cents at Bendigo and 5⅝ cents at Clunes, Australia, 9 cents at Grass Valley and 13 cents at Mammoth, Arizona. These figures depend considerably on prices and freights. The following is a statement of wear in pounds of iron per 100 tons of ore: At Angels Camp, 45 pounds; Grass Valley, 90; Gilpin county, 58; Bendigo, 144; Clunes, 157; Mammoth, 76; Homestake 80½.

E. F. TURNER of Adelaide has filed specifications of a process for the regenerative treatment of argentiferous sulphide ore, in which process the raw sulphide ore is disintegrated by the action of hydrochloric acid (HCl), resulting in the formation of metallic chlorides, which are subsequently fused and the metals recovered, and in the production of sulphuretted hydrogen, which is used as fuel, and the products of its combustion utilized for the production of fresh supplies of HCl. He claims that from the sulphuretted hydrogen so produced not only are fresh supplies of HCl obtained during the process by the treatment of sodium chloride with the sulphur dioxide (SO_2), resulting from the use of the H_2S as fuel, but also from the sodium chloride certain by-products in the form of caustic soda and other soda products are obtained. Portions of such products are used for the recovery of the metals from the aqueous chlorides obtained in the first part of the process.

THE reopening of old abandoned mining properties and their profitable operation has become so familiar a matter in California as to cease to elicit much comment. The same thing occurs everywhere in this country where gold mining is or has been carried on. In addition, thousands of new gold locations and as many more old mines have been revivified and are adding to the output. Rimini district, Montana, is a case in point. The Broadwater had long been abandoned. This month it is being reopened, and by September 1st 150 men will be at work and $75,000 begun to be expended on machinery. The Peerless Jennie, in the same district, one of the oldest mines in Montana, long abandoned but now being worked, is another illustration. Years ago picked ore from this mine was packed on mules to Omaha and shipped to Germany for treatment. New processes, better transportation and the great law of supply and demand now make it worth while to resume operations.

THE publication of the list of California mines and miners, their number, location, characteristics, post office address of owners and superintendents, etc., draws to a close. It was begun April 25th and will, probably, be concluded this month, except some addenda, corrections, etc. It constitutes a directory of the mining properties of California, incomplete, but "a starter" in that direction. From the totals it appears that there are about 2700 mines and nearly 16,000 miners or men employed therein, not including Chinese, who usually work on their own account in abandoned hydraulic claims. Probably no similar number of men in any industrial pursuit anywhere add more, daily or annually, to the world's real wealth than those thousands of California miners, whom this journal feels honored in representing.

NICKEL is reported discovered on the headwaters of the Cowlitz river, in western Washington. A dispatch says "the vein is 100 feet wide, and the ore in sight is reported to be worth millions," which is unlikely. The geological formation of that section is not considered favorable to the existence of nickel, though it is possible that deposits may be found worthy of serious commercial consideration. Josephinite, an alloy of nickel and iron, has been found in Josephine Co., Oregon, and deposits of nickeliferous pyrrhotites discovered in Jackson and Douglas counties in that State, some silicious ores near Riddles, in the latter county, carrying 8% nickel, but their remoteness and cost of reduction has so far militated against the commercial value of the find. Some of the ore from the newly discovered Washington nickel deposit has been tested at the Tacoma Smelting Works with alleged satisfactory result.

LAST Saturday at Angels, Cal., W. Wiber, a miner at the Utica, while watching carpenters putting in some timbers at a manway, fell into the manway a distance of 150 feet. Death was instantaneous. At Butte, Mont., the same day W. Robinson, a miner employed at the Rose mine, and W. Burke, a miner at the Rarus, were instantly killed, the former by falling down a shaft and the latter by a fall of rock. Advices from Alaska tells an unusual form of death for a miner who, at the head of Turnagain Arm, Cook's Inlet, with a party of prospectors was crossing the glacier. A thin sheet of ice secreted a crevice in the crossing. The ice gave way, precipitating two men into the chasm, scarcely 3 feet in width. One, who was carrying a gun, saved himself by using it as a crossbar. The other, named Cenneah of Seattle, Wash., fell to the bottom, 80 feet. He was tightly jammed in the crevice between the ice. The others tied blankets together and attempted to pull him out, but he was so tightly jammed that he could not be moved.

REGARDING sundry samples of infusorial earth "electro-silicon," etc., received during the week from Arizona, Nevada and Lower California, it is to be said that they appear to be of some commercial value in the manufacture of dynamite—giant powder. The San Francisco manufacturers use considerable and would undoubtedly give the preference to home products if price and quality were satisfactory. One giant powder man interviewed, said he had had sampled and analyzed 1328 different lots sent him at various times from all over the coast and had yet to get satisfactory results as to quantity and quality. If the right kind of infusorial earth could be sent to this city in carload lots the San Francisco manufacturers could probably use twenty-five carloads a month. At present the companies manufacturing explosives in the vicinity of this city import the absorbent from Germany, an earth that costs them from $40 to $50 per ton. There is a constant demand for the particular kind of earth used, as the sales of giant have increased three-fold since the recent activity in mining.

AT HORSEFLY, Cariboo, B. C., the California hydraulic elevator is meeting all the local requirements of placer workings The hydraulic work by giant or monitor is done precisely as in any other hydraulic mine. The elevator must be fitted to conditions. Additional water is required to elevate the gravel and material, including the water used in hydraulicking. If the giant or monitor is discharging 500 inches of water at a gravel bank, as much water must pass through the elevator as is necessary to overcome the mass of water and gravel discharging from the sluice on to the elevator or, when 500 inches of water runs onto the elevator with its additional accumulation of gravel, from 800 to 1200 inches of water must discharge upwards from the elevator. The height to which it is raised is then entirely dependent on the amount of pressure from the sand box; a pressure of 300 feet would be adequate to raise 50 to 65 feet, the friction occasioned taking away some of the force. It is not usually understood that the hydraulic elevator obviates the use of a pump to keep the pit clear of water, for it is really a siphon.

WRITING from Trinity Co., Cal., concerning ways and means of hydraulic mining in that section, a correspondent of this paper says: "A peculiar feature used in this end of the State to assist the placer and hydraulic miner is what is known as a 'shooter.' It consists of an automatic reservoir, of various sizes and shapes, that collects all the water not run through the 'giants' or 'monitors' for say fifteen minutes (as in the case of this mine), and then a valve automatically opens of sufficient size to allow all the water thus collected to escape in five minutes, thus obtaining the use of over 20,000 inches of water for five minutes that 2000 inches has furnished by cacheing it for fifteen minutes. I saw the above force of water carry boulders weighing over 500 pounds through one mile of flume in five minutes. Nearly every hydraulic mine in these northern counties is equipped with one of these 'shooters.' On the Boss & McClary placer mine, adjoining Trinity Center, the 'shooter' box is 20x40 feet square and 6 feet deep, with an automatic opening of 18 inches by 4 feet. They have a bedrock flume 6 feet wide by 3 feet deep, nearly half a mile long, lined with 9-inch blocks."

"WHAT does an ounce of silver cost to produce?" is a question often asked and answered, the answer being rarely rational, so much depending on the point of view. One Eastern authority says it can be produced for five cents an ounce, that all a miner has to do is to build a fire at the base of a cliff and melt the bullion out of the ore right there. He also states that while engaged in this primitive pastime the miner can live on five cents a day. Another authority declares that silver can be produced profitably at 65 cents per ounce. The latter estimate seems based on statistics furnished by big concerns, where silver is a bye-product of the smelter and is an incidental output of the work. It is impossible for anyone acquainted with any of the facts to give even an approximate idea of what an ounce of silver costs to produce. Of course, anyone unacquainted with the matter can say whatever his fool fancy suggests. The writer has worked where every ounce of silver produced cost $5, and again where there was a handsome profit at going prices. There are individual cases where gold can be and is produced at a cost of 50 cents an ounce. Yet ,probably every ounce of gold produced on this continent has in the aggregate, taking all things into consideration, cost $20.67. To take one special case as a basis to compute the cost of silver production is a specious and unfair method of reasoning, narrow and grossly misleading. Were it possible to sum up all the money and the value in money of the time spent, it is probable that every ounce of silver produced in the United States has cost $1.29.

Duty and Sampling of Lead Ores.

O. B. WISE, in *Mining*.

British Columbia has a valuable ally in the United States in promoting the smelting industry, as is shown by the recent acts of Congress and ruling of the Treasury Department. Whatever may have prompted the movement, it has certainly stimulated the smelting industry in the province. The reduction in the tariff on lead from 1½ cents per pound to ¾ of a cent stimulated the development in the silver-lead mines in both the East and West Kootenays. Even the few low-grade properties began or contemplated operation. But suddenly the smelters were informed that ore carrying a greater value in lead than in silver would be taxed for the total tonnage rather than on the lead contents. Following this is the act which passed Congress in May establishing Government sampling works at Bonner's Ferry, Idaho, and Northport, Washington, through which all British Columbia lead ores must pass and be sampled. Not less than one-fifth of the shipment in each case must pass through the sampler.

Now let us look at the present situation and the effect that such ruling and acts will produce. The situation in British Columbia for the past few years has brought about results which to-day are approximately as follows: There are three smelters in operation in the province, two of which were built and are owned by citizens of the United States. Only one of the three to-day is smelting lead ore, but the other two contemplate adding lead stacks. The mines of the province have been discovered and developed more largely by Americans than by all others combined, and Americans are almost alone in the desire to purchase and develop silver-lead mines, Canadian and European capital preferring gold mines. True, some Canadian capital is invested in the silver-lead mines of the province, but it is greatly in the minority, and it may truly be said that American money and American brawn are the greatest factors in the development of the silver-lead industry of British Columbia. The same is true of the smelters.

Under the ruling of the United States Treasury Department, a carload of ore shipped from these mines to a smelter in the United States and containing 1200 pounds of lead, having a value of 3 cents per pound, and fifty ounces in silver, worth 68 cents per ounce, would present the following value to the producer, without counting deductions for mining, freight and treatment, but deducting for duty:

CONTENTS—ONE CAR OR TWENTY TONS ORE.

1200 pounds lead per ton (24,000 pounds lead per car, at 3c)	$ 720
50 ounces silver per ton (1000 ounces 68c)	680
Value per car of twenty tons	$1400

DEDUCTIONS.

Duty on lead (24,000 pounds)	$ 108
Duty on silica, and gangue	72
Duty—¾c per pound on total contents, or 40,000 pounds	$180

As there is nothing said in the bill about taxing the silica or other gangue matter contained in lead ores, it appears to an observer that the honorable secretary has taken it into his own hands to levy duty and declare imports. This ruling would not seem so peculiar if it had a precedent, or if all lead ores were taxed for the full contents; but if the owner of a mine in the same district should be so fortunate as to have a few or many more ounces in silver to the ton of ore, and were able to pay this silica tax, he would not be compelled to do so; for did this ore contain but four ounces more silver per ton, and no more lead, the values of each metal being the same as in example above, then the silica tax would be removed and the miner would be a gainer thereby to the amount of $72 per carload.

Below I give an example of the American protection to Canadian industries. The owner of the mine the ore of which is shown in the above example, has an opportunity to avoid the silica tax in part or in whole by having his ore treated on the Canadian side, because the tax on bullion is but ¾ of a cent on each pound of the lead contained therein. He takes a carload to the Canadian smelter but a few miles distant, and built by an American to treat the ores of an American miner in British Columbia, with the result that he saves the $72, or he can afford to divide that amount with the smelter and still be gainer, and in no fear of the silica tax. But, fearing that the bonus which the Canadian Government is giving the smelters in British Columbia is not sufficient, and that the honorable Secretary of the United States Treasury has but half done his duty, now comes the United States Congress and enacts a law which accomplished two results, disastrous to the interests of the United States citizens, it is true, but aiming no doubt to assist the people of British Columbia in the establishment of home industries. A bill is passed by Congress making two points along the Canadian border ports of entry for lead ore, and at which points all lead ores entering this country from the Kootenays must be sampled. This takes one railroad out of the field of competition on ores entering the United States from these points and also compels the mine owner to have all crude ore sampled at one or the other of these works, located respectively on the Spokane Falls & Northern Railroad at Northport, Washington, and on the Great Northern Railway at Bonner's Ferry, Idaho. It must not be understood that this sampling is to be done gratis, for nothing, for such is not the case. A fair compensation for this work will not be less than $5 per carload of twenty tons, or 25 cents per ton. It will also, if operative, succeed in removing the most economical means of transportation—the Canadian Pacific Railway Company. I say "if operative" because it is only fair to presume that the Canadian Pacific Company will make some effort to control a fair share of the business in its own territory, and that they will succeed may be presumed.

I feel sure that the act and ruling above cited to, in addition to what they already accomplished for the Canadian people, will result in the establishment of a smelter at Vancouver or some other seaport in British Columbia, where fuel is cheap, and the product may be transported by water to any part of the United States at a low cost, without sampling obstructions and without duty on silica. That once accomplished, the large silver-lead ore tonnage which is being handled by the several railroads from those mines will almost entirely cease.

Current Copper Statistics.

Under date of New York, August 4, 1896, Houston & Co. write concerning copper:

The past month has been one of unusual dullness in the copper market, with the price of Lake gradually receding from 11½ to 11 cents. During the midsummer season operations are naturally expected to be on a restricted scale; but, owing to recent developments in political circles and the chaotic condition of sentiment on the all-absorbing financial question, the trade is not disposed to launch out, as would be the case under ordinary circumstances, but have adopted a policy of pronounced conservatism, which has tended to confine business mostly within the limits of actual requirements. Consumers being fairly well supplied with the raw material necessary to meet current demand, they have not taken much active part in the market, their attitude lately being that of passive lookers on. This course cannot be pursued indefinitely, however, as the period is drawing near when manufacturers must replenish their stock of copper by liberal purchases.

The foreign situation is one of marked contrast with the domestic position. European consumption has been steadily increasing, and latest advices indicate bright prospects for a continued heavy demand. All branches of business in which copper figures are particularly active on the other side of the Atlantic. In England alone the consumption of copper during the first six months of this year exceeds that for the entire year of 1888, when the "French syndicate" was in operation, and almost equals that for the whole of 1892. The increase is at the rate of about 50 per cent compared with the first six months of 1895. Consumption of copper in England and France for the first half of 1896 is returned at 61,963 tons, or 3645 tons more than the total American copper export to all countries during the same period. The quantity of copper consumed by these two countries for the six months ending June 30th is equivalent to 61 per cent of the entire United States production at the maximum rate of output. There has been a large increase of consumption in Germany, also, and regular heavy shipments to other European ports furnish ample evidence of the growing demand for copper throughout the continent of Europe. In addition thereto, continual inroads into foreign stocks of copper have constantly been taking place until the aggregate stocks of G. M. B. copper is now small indeed, and it is understood that these have become concentrated in a few strong hands. In fact, the world-wide position of copper *per se*, at present appears to be a most healthy and promising one, and it would not be surprising to witness a sharp advance in the market value of the metal before many weeks elapse.

The following are the lowest and highest prices of copper during July, 1896:

LAKE COPPER, NEW YORK.

Cents Per Pound.

Lowest	11.00
Highest	11.50

G. M. B. SPOT COPPER, LONDON.

£ Per Gross Ton.

Lowest	48 2 6
Highest	49 12 6

London sales G. M. B. copper in July amounted to 19,950 tons. A year ago Lake copper was 12 cents strong, with the London market considerably below what it is to-day.

The copper production, in tons of 2240 pounds, was as follows:

JUNE.

	1896.	1895.	Increase.	Decrease.
United States	16,026	12,741	3,284	.....
European	7,055	6,965	90	.....
U. S. Exports	9,797	8,600	1,197	.....

FIRST SIX MONTHS.

	1896.	1895.	Increase.	Decrease.
United States	101,380	79,712	21,668	.....
European	42,255	42,484	.....	229
U. S. Exports	58,318	34,215	24,103	.....

American production in June was 708 tons less than in the month previous. The maximum production in this country was reached in March, 1896, when the monthly output was 17,992 tons.

Returns of copper production in the United States for 1895 are now made from official sources, and show the following:

	Pounds.
Lake Superior	129,824,213
Montana	190,172,150
Arizona	47,953,553
Colorado	6,079,243
Utah	2,184,708
Idaho	1,425,914
New Mexico	143,719
California	218,332
Tennessee	3,105,036
Total	381,106,868

The Calumet & Hecla Mining Co. have issued a report for the fiscal year ending April 30, 1896, showing assets of $7,038,529.04 and liabilities of $992,784.51, leaving a balance of $6,045,744.53, represented by cash, copper, mineral and bills receivable—the copper being figured at 8¼ cents per pound and the mineral at 4 cents per pound.

During the past fiscal year the company produced 85,552,756 pounds of refined copper, against 62,466,414 pounds the previous year. During the twelve months covered by the report, the company paid five dividends of $5 each. The Calumet & Hecla has now reached the deepest point ever attained and has accumulated the largest surplus in its history, besides eclipsing all former records in production. The president states that the openings of the mine available for stopings amount to ten years, at last year's rate of production. The balance of assets equals fully $60 a share, or one-fifth the market value.

The Wolverine Copper Mining Co. report the production of copper for the year ending June 30, 1896, to be 2,011,633 pounds, which has been sold at a net gain, all disbursements deducted, of $50,380.38, which with the balance carried forward from the previous year, leaves a surplus on hand June 30, 1896, of $94,679.62. During the last three years this company has steadily reduced the cost of production and increased its profit and surplus accounts. The rock showed a marked increase in richness during the year, and, being favored with first-class management, the Wolverine has undoubtedly a promising future before it. Contemplated developments and increased stamping facilities would probably enable the company to double their output. Total cost of refined copper was 8.36 cents per pound.

Exports of copper from the United States in July were 10,409 tons. The following are the exports for seven months, in tons of 2240 pounds fine copper:

	1896.	1895.	Increase.
January	8,168	7,144	1,024
February	8,296	3,450	4,846
March	10,892	3,914	6,978
April	10,684	5,677	5,007
May	10,481	5,430	5,051
June	9,797	8,600	1,197
July	10,409	6,035	4,374
Total seven months	68,727	40,250	28,477

European copper statistics by cable to-day show the total visible supply of copper to be 34,180 tons, being a reduction since July 15th of 1080 tons and 2120 tons decrease since July 1st. European deliveries for the month of July were 19,500 tons.

The London market for G. M. B. copper closed to-day at £49 2s 6d spot and £48 17s 6d futures. Sales amount to 375 tons spot and 550 tons futures.

The domestic market closes 11¼ asked for Lake, with sales at 11 15/100 spot, 11 for electrolytic and 10⅝@10¾ for casting.

A Secretary of Mines.

The MINING AND SCIENTIFIC PRESS is advocating anew the advisability of adding to the Cabinet a Secretary of Mines. The growing importance of the mineral industry would seem to warrant the addition. The objection offered to the departure by many that the magnitude of the mining industry does not warrant it, is based chiefly on the assumption that it would be in the field of precious minerals only that the executive would devote his entire time and attention. It is scarcely possible that such an important office would be established to cater to any special branch of the industry, but if the coal and iron as well as the copper, silver, lead and gold mines were to amalgamate their interests in an endeavor to create this new department, the showing they could make of the value of their products and the number employed would be so great as to demand some substantial consideration. Once established the work of the department could be so segregated under competent hands that the value to each branch of the industry would be quite as great as if the office was created solely in behalf of the precious mineral contingent. The proposition is worth advocating. The MINING AND SCIENTIFIC PRESS occupies an enviable position in the public mind and is therefore well able to lay the matter before the powers that be.—Sonora Democrat.

CHICAGO engineers are pushing a scheme to build a ship canal to connect the Calumet river at its mouth with the new drainage at Sag Bridge, at a cost of $10,000,000. This would complete a belt line of water way around the city.

Scientific Progress.

International Boundary Line.

From the north comes an unlikely statement that errors had been discovered in the running of the forty-ninth parallel, which, if corrected, would throw the mining district of Rossland, B. C., into the United States. Such an error is not probable.

In establishing an international boundary line, it is usual for each Government to be represented by competent engineers, and for the line to be run by astronomical observation. Straight lines on parallels of latitude are determined by observation of the stars, usually the Pole star. If the axis of the earth were strictly in the direction of this star it would be a simple matter to carry along this angle, for at every point in this parallel line the angle made by the earth's horizon with the extended axis of the earth must be the same. But the axis of the earth projected does not point directly to the Pole star, but it has a slight variation, and twice each day the axis of the earth is in a line with the star in the daily revolution of the earth. These variations are computed by astronomers for the use of surveyors. If a transit line is run, taking a right angle with the due north line, the tendency is to run off towards the equator, because the parallel line is a circle, and each point in this circle is not an exact right angle with the line towards the pole. In order to arrest this tendency to go too far southward geographers have calculated a table of offsets for each chain, mile, or other distance, and this correction is made as frequently as necessary. This, together with the astronomical observation, makes it practically impossible that any serious error should creep in. In the United States Government surveys the solar compass is used, and by a reflection of the sun's image on the horizon of the instrument the latitude is established at all times.

There have been numerous alleged discoveries of errors in the international boundary. A few years ago it was stated that a strip of land in Whatcom county, Wash., belonged to British Columbia. No attention was paid to the matter by either Government, both being satisfied that when a line was run and the reports accepted the line was there to stay.

SERGEANT GORDON, in charge of the heliograph station at Bisbee, Arizona, engaged in sending daily heliograms to San Bernardino, has produced what is believed to be a new experience. It has always been assumed that it was not possible to flash heliographic signals across any stretch of country if there were any precipitation between the two instruments. On July 18th Sergeant Gordon was engaged in sending a message to the station at the Silver Creek range, both he and the receiving station having full, bright sunshine, when it suddenly began to rain between them, the storm seeming to cover almost half the width of the Sulphur Spring valley, and as it finally passed across the field of the instruments the fast-falling rain was so dense as to entirely obliterate every vestige of the hills at the receiving station and for miles in each direction. As the message was important the sergeant decided to try if he could send the remainder through the rain. He accordingly went on flashing the rest of the message as though he had clear sunlight all the way, and at the conclusion was delighted to see the flash from the other heliograph come back to him saying "O. K." Then the two operators communicated back and forth through the rain until they settled beyond the peradventure of a doubt that the falling rain—so dense as to entirely conceal each station from the other, and miles in width—could not prevent the passage of the flashes of the heliograph.

MOUNTAIN RANGES are mere wrinkles on the surface of the earth. Scientifically, we measure these wrinkles by finding out how high they are above the sea level. There are two classes of mountains—the table and the folded mountains. As to the individual points or peaks, which are the highest, they are of two classes—those which are volcanic and those which have defied weathering or denudation. When the country was raised above the sea there was a natural slope toward the oceans, and the water from the melted snows or the rivers cut through the land. The water shed then was plowed by these streams. There used to be held, in accordance with the Murchison idea, the general theory that mountains were mainly due to cracks which took place in the earth's surface in remote periods, but this idea is no longer entertained. As to form of mountain, the one known as table mountain finds the best example at the Cape of Good Hope. It is believed that this mountain is due, not to upheaval, but to the sinking of the surrounding districts. Why these peculiarly defined areas did not sink is based on the theory that the ground under them cooled before the rest of the section, and so the table mountain had an earlier foundation, and has long retained its place. There always would be denudation, however, but proportionate with its surroundings, and so, being higher at the start, it still keeps to its approximate elevation.

ACONCAGUA, the highest peak on the Western hemisphere, is to be attempted again next month by E. A. Fitzgerald, who explored the New Zealand Alps. If he succeeds in getting to the top, which is 23,200 feet above sea level, he will beat the highest mountain-climbing record—W. M. Conway's 22,600 feet ascent of Pioneer peak in the Himalayas. Dr. Gussfeldt has tried Aconcagua, but got into trouble with his guides and had to turn back 2000 feet from the summit. Mr. Fitzgerald will have in his party the Swiss guide Zurbriggen, who accompanied him in New Zealand and was with Conway in the Himalayas.

Mechanical Progress.

Hollow Instead of Solid Shafting.

A bar of iron in a machine may be subjected to any one of three different kinds of strain: a lengthwise pull, unequal pressures which would bend it, and a twist. A piece of shafting, on which there are two pulleys, one deriving power from an engine and the other imparting it to a heavy machine, is often made to undergo this third sort of strain. It has long been recognized that greater rigidity is secured if the same amount of metal is put in tubular form than in a solid rod. That is why a bicycle frame is made of tubing. The various portions are less likely to bend than if the steel is compact. Similarly a shaft would stand a torsional, or twisting, strain much better if the material composing it were arranged in a tube. This being the case, it may seem strange that hollow shafting has not already come into extensive use. The principle is not at all new. But certain mechanical difficulties, which would not affect bicycle construction, have been encountered in this other application of the idea. For instance, a pulley is sometimes fastened to a shaft by means of a bit of metal, called a key, wedged in between the two, a slight recess or seat being cut in the shaft and the inner surface of the wheel to receive it. Now, so long as the shaft is solid the key can be driven inward rather recklessly. But if the shaft were hollow it might spring a little under the pressure, and its shape might be distorted. It is coming to be recognized, however, that screw clamping bolts, running radially inward from the hub of a pulley, will grip the shaft as firmly as a key. The latter is pronounced needless by experts. A serious objection to the use of hollow shafting is therefore removed, and already the idea is coming into fashion.

STEEL storage tanks for grain are taking the place throughout the country of the old wooden elevators, and pneumatic tubes are used to convey the grain from the place of the storage to the mill, where formerly it was wheeled in barrows over bridges between buildings or through underground tunnels. The erection of air-tight steel storage tanks or bins for grain in place of the old wooden structures not only does away with all danger from fire, but it is claimed that it preserves the grain for an indefinite period of time, and also makes impossible the presence of weevils or other vermin so destructive to grain in storage.

There being no inflammable material used in the construction of these steel tanks there is no need of insurance, and mill men claim that within six or seven years the saving on insurance alone will more than pay for the first cost of construction.

Turning Trees Into Newspapers.

An interesting experiment was recently made at Menzel & Co.'s paper and wood pulp manufactory at Elsenthal to ascertain what was the shortest space of time in which it was possible to convert the wood of a standing tree into paper, and the latter into a journal ready for delivery.

Three trees were felled in a forest near the establishment at thirty-five minutes past 7 A. M., in the presence of two of the owners of the manufactory and a notary whom they had called upon to certify as to the authenticity of the experiment. These trees were carried to the manufactory, where they were cut into pieces 12 inches in length, which were then decorticated and split. The wood thus prepared was afterward raised by an elevator to the five defibrators of the works. The wood pulp produced by these machines was then put into a vat, where it was mixed with the necessary materials. This process finished, the liquid pulp was sent to the paper machine. At thirty-four minutes past 9 in the morning the first sheet of paper was finished. The entire manufacture had thus consumed but one hour and fifty-nine minutes.

The owners of the manufactory, accompanied by the notary, then took a few of the sheets to a printing office situated at a distance of about two and a half miles from the works. At 10 o'clock a copy of the printed journal was in the hands of the party; so that it had taken two hours and twenty-five minutes to convert the wood of a standing tree into a journal ready for delivery.

During the course of the manufacture there occurred a few interruptions which might be avoided at another time, and that, in the opinion of the two manufacturers, had it not been for this twenty minutes might have been gained.

AN instrument, intended for the arrest of bleeding in surgical operations, has been perfected by Lawson Tait. A platinum wire, arranged to carry a current of electricity, is inclosed in the blades of a pair of steel forceps or any other requisite instrument, the wire being insulated by a bed of burnt pipe clay. A current of suitable voltage is turned on, the artery seized and compressed, and in a few seconds the tissues and arterial walls are so agglutinated that the passage of blood is rendered impossible. The temperature employed is about 180° Fahrenheit, so that it will be seen that the principle is fundamentally different from that of electrical cauterizing instruments.

AT Sault Ste. Marie, Mich., on the 3d inst., the 800-foot lock was opened at 10:39 o'clock, two steamers being "locked" through. No official programme marked the opening of the largest lock in the world and the completion of one of the greatest engineering feats in the history of the country. The lock was commenced in 1889. It is 800 feet in length between the gates, and 1100 feet in length over all, 43 feet high, 100 feet wide, and will accommodate boats drawing 21 feet of water.

Electrical Progress.

Niagara Falls Power Transmission.

The first step toward the actual transmission of the power of Niagara Falls over any considerable distance has been made, and Buffalo will be the first city to benefit by it. By November 4th, '96, the cars of the Buffalo Railway Company will be driven by the electricity generated at the power house by the side of the great cataract, and the transmission of its power over a long distance will have become an accomplished fact. The system of transmission employed is the three-phase system, developed by the engineers of the General Electric Company; the transmission can be thus effected over three wires. In the two-phase, four wires would be used to convey the same amount of power. The contracts were made between the Cataract Construction Company supplying the electricity and the General Electric Company, and between the latter company and the Buffalo Power and Conduit Company controlling the supply and distribution of the Niagara power in Buffalo, and the Buffalo Railway Company.

The contract with the Cataract Construction Company covers three of the air-blast type transformers. These will be the largest transformers ever constructed, and will step-up the Niagara 2200-volt two-phase current to either 11,000 or 22,000 volts three-phase. Any two of the transformers together will deliver 2500 H. P.; the third is a spare one. It is the intention of the Cataract Construction Co. to commence transmission operations at 11,000 volts, and later to increase the capacity of their transmission system by increasing the potential to 22,000 volts. The transformers will be designed and insulated to withstand the latter pressure. The pole line will be erected by the White-Crosby Co., and will have capacity sufficient to transmit 40,000 H. P.

For transforming the power down and converting it into that suitable for street railway purposes the Power and Conduit Co. purchased four static transformers of about 360 H. P. each and two 500 H. P. rotary converters. The transformers will reduce from the line potential of either 11,000 or 22,000 volts to 400 volts, at which voltage the three-phase current will be turned into the rotary converters and then converted into direct railway current of 550 volts. The latter will be compound wound, and will operate in multiple with the steam-driven generators, supplying the balance of the power necessary for the operation of the railway system. They will be of the iron-clad type with steel frames, with collector rings for the three-phase current at one end and a commutator for the direct current at the other. They will have six poles and will run at 500 revolutions per minute, and are similar to that placed in the Niagara power house to furnish current to the Buffalo & Niagara Falls Railroad.

The Rod Type of Trolley.

The name "trolley," originally and properly applied only to a trailing grooved wheel at the end of a pole, afterward became synonymous with an electrically propelled car, because it was by means of such a wheel that nearly all such vehicles obtained their supply of current from the overhead wire. In order to evade the patent on that device, however, a revolving rod (or slender cylinder) is substituted for the wheel on many European roads. The rod is 18 or 20 inches long and slides to and fro as the car rocks, goes around curves or meets switches. Contact with the source of electricity is thus preserved effectually. It is not necessary, therefore, to provide the pole at its base with means for swinging sideways. The up and down motion is sufficient for all practical purposes. As with the present style of trolley, this new one is forced upward against the wire by means of springs connected

Duty and Sampling of Lead Ores.

O. B. WISE, in *Mining*.

British Columbia has a valuable ally in the United States in promoting the smelting industry, as is shown by the recent acts of Congress and ruling of the Treasury Department. Whatever may have prompted the movement, it has certainly stimulated the smelting industry in the province. The reduction in the tariff on lead from 1½ cents per pound to ¾ of a cent stimulated the development in the silver-lead mines in both the East and West Kootenays. Even the few low-grade properties began or contemplated operation. But suddenly the smelters were informed that ore carrying a greater value in lead than in silver would be taxed for the total tonnage rather than on the lead contents. Following this is the act which passed Congress in May establishing Government sampling works at Bonner's Ferry, Idaho, and Northport, Washington, through which all British Columbia lead ores must pass and be sampled. Not less than one-fifth of the shipment in each case must pass through the sampler.

Now let us look at the present situation and the effect that such ruling and acts will produce. The situation in British Columbia for the past few years has brought about results which to-day are approximately as follows: There are three smelters in operation in the province, two of which were built and are owned by citizens of the United States. Only one of the three to-day is smelting lead ore, but the other two contemplate adding lead stacks. The mines of the province have been discovered and developed more largely by Americans than by all others combined, and Americans are almost alone in the desire to purchase and develop silver-lead mines, Canadian and European capital preferring gold mines. True, some Canadian capital is invested in the silver-lead mines of the province, but it is greatly in the minority, and it may truly be said that American money and American brawn are the greatest factors in the development of the silver-lead industry of British Columbia. The same is true of the smelters.

Under the ruling of the United States Treasury Department, a carload of ore shipped from these mines to a smelter in the United States and containing 1200 pounds of lead, having a value of 3 cents per pound, and fifty ounces in silver, worth 68 cents per ounce, would present the following value to the producer, without counting deductions for mining, freight and treatment, but deducting for duty:

CONTENTS—ONE CAR OR TWENTY TONS ORE.

1200 pounds lead per ton (24,000 pounds lead per car, at 3c)	$ 720
50 ounces silver per ton (1000 ounces 68c)	680
Value per car of twenty tons	$1400

DEDUCTIONS.

Duty on lead (24,000 pounds)	$ 108
Duty on silica, and gangue	72
Duty—¾c per pound on total contents, or 40,000 pounds	$180

As there is nothing said in the bill about taxing the silica or other gangue matter contained in lead ores, it appears to an observer that the honorable secretary has taken it into his own hands to levy duty and declare imports. This ruling would not seem so peculiar if it had a precedent, or if all lead ores were taxed for the full contents; but if the owner of a mine in the same district should be so fortunate as to have a few or many more ounces in silver to the ton of ore, and were able to pay this silica tax, he would not be compelled to do so; for did this ore contain but four ounces more silver per ton, and no more lead, the values of each metal being the same as in example above, then the silica tax would be removed and the miner would be a gainer thereby to the amount of $72 per carload.

Below I give an example of the American protection to Canadian industries. The owner of the mine the ore of which is shown in the above example, has an opportunity to avoid the silica tax in part or in whole by having his ore treated on the Canadian side, because the tax on bullion is but ¾ of a cent on each pound of the lead contained therein. He takes a carload to the Canadian smelter but a few miles distant, and built by an American to treat the ores of an American miner in British Columbia, with the result that he saves the $72, or he can afford to divide that amount with the smelter and still be gainer, and in no fear of the silica tax. But, fearing that the bonus which the Canadian Government is giving the smelters in British Columbia is not sufficient, and that the honorable Secretary of the United States Treasury has but half done his duty, now comes the United States Congress and enacts a law which accomplished two results, disastrous to the interests of the United States citizens, it is true, but aiming no doubt to assist the people of British Columbia in the establishment of home industries. A bill is passed by Congress making two points along the Canadian border ports of entry for lead ore, and at which points all lead ores entering this country from the Kootenays must be sampled. This takes one railroad out of the field of competition on ores entering the United States from these points and also compels the mine owner to have all crude ore sampled at one or the other of these works, located respectively on the Spokane Falls & Northern Railroad at Northport, Washington, and on the Great Northern Railway at Bonner's Ferry, Idaho. It must not be understood that this sampling is to be done gratis, for nothing, for such is not the case. A fair compensation for this work will not be less than $5 per carload of twenty tons, or 25 cents per ton. It will also, if operative, succeed in removing the most economical means of transportation—the Canadian Pacific Railway Company. I say "if operative" because it is only fair to presume that the Canadian Pacific Company will make some effort to control a fair share of the business in its own territory, and that they will succeed may be presumed.

I feel sure that the act and ruling above cited to, in addition to what they already accomplished for the Canadian people, will result in the establishment of a smelter at Vancouver or some other seaport in British Columbia, where fuel is cheap, and the product may be transported by water to any part of the United States at a low cost, without sampling obstructions and without duty on silica. That once accomplished, the large silver-lead ore tonnage which is being handled by the several railroads from those mines will almost entirely cease.

Current Copper Statistics.

Under date of New York, August 4, 1896, Houston & Co. write concerning copper:

The past month has been one of unusual dullness in the copper market, with the price of Lake gradually receding from 11½ to 11 cents. During the midsummer season operations are naturally expected to be on a restricted scale; but, owing to recent developments in political circles and the chaotic condition of sentiment on the all-absorbing financial question, the trade is not disposed to launch out, as would be the case under ordinary circumstances, but have adopted a policy of pronounced conservatism, which has tended to confine business mostly within the limits of actual requirements. Consumers being fairly well supplied with the raw material necessary to meet current demand, they have not taken much active part in the market, their attitude lately being that of passive lookers on. This course cannot be pursued indefinitely, however, as the period is drawing near when manufacturers must replenish their stock of copper by liberal purchases.

The foreign situation is one of marked contrast with the domestic position. European consumption has been steadily increasing, and latest advices indicate bright prospects for a continued heavy demand. All branches of business in which copper figures are particularly active on the other side of the Atlantic. In England alone the consumption of copper during the first six months of this year exceeds that for the entire year of 1888, when the "French syndicate" was in operation, and almost equals that for the whole of 1892. The increase is at the rate of about 50 per cent compared with the first six months of 1895. Consumption of copper in England and France for the first half of 1896 is returned at 61,963 tons, or 3645 tons more than the total American copper export to all countries during the same period. The quantity of copper consumed by these two countries for the six months ending June 30th is equivalent to 61 per cent of the entire United States production at the maximum rate of output. There has been a large increase of consumption in Germany, also, and regular heavy shipments to other European ports furnish ample evidence of the growing demand for copper throughout the continent of Europe. In addition thereto, continual inroads into foreign stocks of copper have constantly been taking place until the aggregate stocks of G. M. B. copper is now small indeed, and it is understood that these have become concentrated in a few strong hands. In fact, the world-wide position of copper *per se*, at present appears to be a most healthy and promising one, and it would not be surprising to witness a sharp advance in the market value of the metal before many weeks elapse.

The following are the lowest and highest prices of copper during July, 1896:

LAKE COPPER, NEW YORK.

Cents Per Pound.

Lowest	11.00
Highest	11.50

G. M. B. SPOT COPPER, LONDON.

£ Per Gross Ton.

Lowest	48 2 6
Highest	49 12 6

London sales G. M. B. copper in July amounted to 19,950 tons. A year ago Lake copper was 12 cents strong, with the London market considerably below what it is to-day.

The copper production, in tons of 2240 pounds, was as follows:

JUNE.

	1896.	1895.	Increase.	Decrease.
United States	16,026	12,741	3,284	.....
European	7,055	6,965	90	.....
U. S. Exports	9,797	8,600	1,197	.....

FIRST SIX MONTHS.

	1896.	1895.	Increase.	Decrease.
United States	101,380	79,712	21,668	.....
European	42,255	42,484	.....	229
U. S. Exports	58,318	34,215	24,103	.....

American production in June was 708 tons less than in the month previous. The maximum production in this country was reached in March, 1896, when the monthly output was 17,992 tons.

Returns of copper production in the United States for 1895 are now made from official sources, and show the following:

	Pounds.
Lake Superior	129,824,213
Montana	190,172,150
Arizona	47,953,553
Colorado	6,079,243
Utah	2,184,708
Idaho	1,425,914
New Mexico	143,719
California	218,332
Tennessee	3,105,036
Total	381,106,868

The Calumet & Hecla Mining Co. have issued a report for the fiscal year ending April 30, 1896, showing assets of $7,038,529.04 and liabilities of $992,784.51, leaving a balance of $6,045,744.53, represented by cash, copper, mineral and bills receivable—the copper being figured at 8¼ cents per pound and the mineral at 4 cents per pound.

During the past fiscal year the company produced 85,552,756 pounds of refined copper, against 62,466,414 pounds the previous year. During the twelve months covered by the report, the company paid five dividends of $5 each. The Calumet & Hecla has now reached the deepest point ever attained and has accumulated the largest surplus in its history, besides eclipsing all former records in production. The president states that the openings of the mine available for stopings amount to ten years, at last year's rate of production. The balance of assets equals fully $60 a share, or one-fifth the market value.

The Wolverine Copper Mining Co. report the production of copper for the year ending June 30, 1896, to be 2,011,633 pounds, which has been sold at a net gain, all disbursements deducted, of $50,380.38, which with the balance carried forward from the previous year, leaves a surplus on hand June 30, 1896, of $94,679.62. During the last three years this company has steadily reduced the cost of production and increased its profit and surplus accounts. The rock showed a marked increase in richness during the year, and, being favored with first-class management, the Wolverine has undoubtedly a promising future before it. Contemplated developments and increased stamping facilities would probably enable the company to double their output. Total cost of refined copper was 8.36 cents per pound.

Exports of copper from the United States in July were 10,409 tons. The following are the exports for seven months, in tons of 2240 pounds fine copper:

	1896.	1895.	Increase.
January	8,168	7,144	1,024
February	8,296	3,450	4,846
March	10,892	3,914	6,978
April	10,684	5,677	5,007
May	10,481	5,430	5,051
June	9,797	8,600	1,197
July	10,409	6,035	4,374
Total seven months	68,737	40,250	28,477

European copper statistics by cable to-day show the total visible supply of copper to be 34,180 tons, being a reduction since July 15th of 1080 tons and 2120 tons decrease since July 1st. European deliveries for the month of July were 19,500 tons.

The London market for G. M. B. copper closed to-day at £49 2s 6d spot and £48 17s 6d futures. Sales amount to 375 tons spot and 550 tons futures.

The domestic market closes 11¼ asked for Lake, with sales at 11$\frac{15}{100}$ spot, 11 for electrolytic and 10⅝@ 10¾ for casting.

A Secretary of Mines.

The MINING AND SCIENTIFIC PRESS is advocating anew the advisability of adding to the Cabinet a Secretary of Mines. The growing importance of the mineral industry would seem to warrant the addition. The objection offered to the departure by many that the magnitude of the mining industry does not warrant it, is based chiefly on the assumption that it would be in the field of precious minerals only that the executive would devote his entire time and attention. It is scarcely possible that such an important office would be established to cater to any special branch of the industry, but if the coal and iron as well as the copper, silver, lead and gold mines were to amalgamate their interests in an endeavor to create this new department, the showing they could make of the value of their products and the number employed would be so great as to demand some substantial consideration. Once established the work of the department could be so segregated under competent hands that the value to each branch of the industry would be quite as great as if the office was created solely in behalf of the precious mineral contingent. The proposition is worth advocating. The MINING AND SCIENTIFIC PRESS occupies an enviable position in the public mind and is therefore well able to lay the matter before the powers that be.—Sonora Democrat.

CHICAGO engineers are pushing a scheme to build a ship canal to connect the Calumet river at its mouth with the new drainage at Sag Bridge, at a cost of $10,000,000. This would complete a belt line of water way around the city.

Scientific Progress.

International Boundary Line.

From the north comes an unlikely statement that errors had been discovered in the running of the forty-ninth parallel, which, if corrected, would throw the mining district of Rossland, B. C., into the United States. Such an error is not probable.

In establishing an international boundary line, it is usual for each Government to be represented by competent engineers, and for the line to be run by astronomical observation. Straight lines on parallels of latitude are determined by observation of the stars, usually the Pole star. If the axis of the earth were strictly in the direction of this star it would be a simple matter to carry along this angle, for at every point in this parallel line the angle made by the earth's horizon with the extended axis of the earth must be the same. But the axis of the earth projected does not point directly to the Pole star, but it has a slight variation, and twice each day the axis of the earth is in a line with the star in the daily revolution of the earth. These variations are computed by astronomers for the use of surveyors. If a transit line is run, taking a right angle with the due north line, the tendency is to run off towards the equator, because the parallel line is a circle, and each point in this circle is not an exact right angle with the line towards the pole. In order to arrest this tendency to go too far southward geographers have calculated a table of offsets for each chain, mile, or other distance, and this correction is made as frequently as necessary. This, together with the astronomical observation, makes it practically impossible that any serious error should creep in. In the United States Government surveys the solar compass is used, and by a reflection of the sun's image on the horizon of the instrument the latitude is established at all times.

There have been numerous alleged discoveries of errors in the international boundary. A few years ago it was stated that a strip of land in Whatcom county, Wash., belonged to British Columbia. No attention was paid to the matter by either Government, both being satisfied that when a line was run and the reports accepted the line was there to stay.

SERGEANT GORDON, in charge of the heliograph station at Bisbee, Arizona, engaged in sending daily heliograms to San Bernardino, has produced what is believed to be a new experience. It has always been assumed that it was not possible to flash heliographic signals across any stretch of country if there were any precipitation between the two instruments. On July 18th Sergeant Gordon was engaged in sending a message to the station at the Silver Creek range, both he and the receiving station having full, bright sunshine, when it suddenly began to rain between them, the storm seeming to cover almost half the width of the Sulphur Spring valley, and as it finally passed across the field of the instruments the fast-falling rain was so dense as to entirely obliterate every vestige of the hills at the receiving station and for miles in each direction. As the message was important the sergeant decided to try if he could send the remainder through the rain. He accordingly went on flashing the rest of the message as though he had clear sunlight all the way, and at the conclusion was delighted to see the flash from the other heliograph come back to him saying "O. K." Then the two operators communicated back and forth through the rain until they settled beyond the peradventure of a doubt that the falling rain—so dense as to entirely conceal each station from the other, and miles in width—could not prevent the passage of the flashes of the heliograph.

MOUNTAIN RANGES are mere wrinkles on the surface of the earth. Scientifically, we measure these wrinkles by finding out how high they are above the sea level. There are two classes of mountains—the table and the folded mountains. As to the individual points or peaks, which are the highest, they are of two classes—those which are volcanic and those which have defied weathering or denudation. When the country was raised above the sea there was a natural slope toward the oceans, and the water from the melted snows or the rivers cut through the land. The water shed then was plowed by these streams. There used to be held, in accordance with the Murchison idea, the general theory that mountains were mainly due to cracks which took place in the earth's surface in remote periods, but this idea is no longer entertained. As to form of mountain, the one known as table mountain finds the best example at the Cape of Good Hope. It is believed that this mountain is due, not to upheaval, but to the sinking of the surrounding districts. Why these peculiarly defined areas did not sink is based on the theory that the ground under them cooled before the rest of the section, and so the table mountain had an earlier foundation, and has long retained its place. There always would be denudation, however, but proportionate with its surroundings, and so, being higher at the start, it still keeps to its approximate elevation.

ACONCAGUA, the highest peak on the Western hemisphere, is to be attempted again next month by E. A. Fitzgerald, who explored the New Zealand Alps. If he succeeds in getting to the top, which is 23,200 feet above sea level, he will beat the highest mountain-climbing record.—W. M. Conway's 22,600 feet ascent of Pioneer peak in the Himalayas. Dr. Gussfeldt has tried Aconcagua, but got into trouble with his guides and had to turn back 2000 feet from the summit. Mr. Fitzgerald will have in his party the Swiss guide Zurbriggen, who accompanied him in New Zealand and was with Conway in the Himalayas.

Mechanical Progress.

Hollow Instead of Solid Shafting.

A bar of iron in a machine may be subjected to any one of three different kinds of strain: a lengthwise pull, unequal pressures which would bend it, and a twist. A piece of shafting, on which there are two pulleys, one deriving power from an engine and the other imparting it to a heavy machine, is often made to undergo this third sort of strain. It has long been recognized that greater rigidity is secured if the same amount of metal is put in tubular form than in a solid rod. That is why a bicycle frame is made of tubing. The various portions are less likely to bend than if the steel is compact. Similarly a shaft would stand a torsional, or twisting, strain much better if the material composing it were arranged in a tube. This being the case, it may seem strange that hollow shafting has not already come into extensive use. The principle is not at all new. But certain mechanical difficulties, which would not affect bicycle construction, have been encountered in this other application of the idea. For instance, a pulley is sometimes fastened to a shaft by means of a bit of metal, called a key, wedged in between the two, a slight recess or seat being cut in the shaft and the inner surface of the wheel to receive it. Now, so long as the shaft is solid the key can be driven inward rather recklessly. But if the shaft were hollow it might spring a little under the pressure, and its shape might be distorted. It is coming to be recognized, however, that screw clamping bolts, running radially inward from the hub of a pulley, will grip the shaft as firmly as a key. The latter is pronounced needless by experts. A serious objection to the use of hollow shafting is therefore removed, and already the idea is coming into fashion.

STEEL storage tanks for grain are taking the place throughout the country of the old wooden elevators, and pneumatic tubes are used to convey the grain from the place of the storage to the mill, where formerly it was wheeled in barrows over bridges between buildings or through underground tunnels. The erection of air-tight steel storage tanks or bins for grain in place of the old wooden structures not only does away with all danger from fire, but it is claimed that it preserves the grain for an indefinite period of time, and also makes impossible the presence of weevils or other vermin so destructive to grain in storage.

There being no inflammable material used in the construction of these steel tanks there is no need of insurance, and mill men claim that within six or seven years the saving on insurance alone will more than pay for the first cost of construction.

Turning Trees Into Newspapers.

An interesting experiment was recently made at Menzel & Co.'s paper and wood pulp manufactory at Elsenthal to ascertain what was the shortest space of time in which it was possible to convert the wood of a standing tree into paper, and the latter into a journal ready for delivery.

Three trees were felled in a forest near the establishment at thirty-five minutes past 7 A. M., in the presence of two of the owners of the manufactory and a notary whom they had called upon to certify as to the authenticity of the experiment. These trees were carried to the manufactory, where they were cut into pieces 12 inches in length, which were then decorticated and split. The wood thus prepared was afterward raised by an elevator to the five defibrators of the works. The wood pulp produced by these machines was then put into a vat, where it was mixed with the necessary materials. This process finished, the liquid pulp was sent to the paper machine. At thirty-four minutes past 9 in the morning the first sheet of paper was finished. The entire manufacture had thus consumed but one hour and fifty-nine minutes.

The owners of the manufactory, accompanied by the notary, then took a few of the sheets to a printing office situated at a distance of about two and a half miles from the works. At 10 o'clock a copy of the printed journal was in the hands of the party; so that it had taken two hours and twenty-five minutes to convert the wood of a standing tree into a journal ready for delivery.

During the course of the manufacture there occurred a few interruptions which might be avoided at another time, and that, in the opinion of the two manufacturers, had it not been for this twenty minutes might have been gained.

AN instrument, intended for the arrest of bleeding in surgical operations, has been perfected by Lawson Tait. A platinum wire, arranged to carry a current of electricity, is inclosed in the blades of a pair of steel forceps or any other requisite instrument, the wire being insulated by a bed of burnt pipe clay. A current of suitable voltage is turned on, the artery seized and compressed, and in a few seconds the tissues and arterial walls are so agglutinated that the passage of blood is rendered impossible. The temperature employed is about 180° Fahrenheit, so that it will be seen that the principle is fundamentally different from that of electrical cauterizing instruments.

AT Sault Ste. Marie, Mich., on the 3d inst., the 800-foot lock was opened at 10:39 o'clock, two steamers being "locked" through. No official programme marked the opening of the largest lock in the world and the completion of one of the greatest engineering feats in the history of the country. The lock was commenced in 1889. It is 800 feet in length between the gates, and 1100 feet in length over all, 43 feet high, 100 feet wide, and will accommodate boats drawing 21 feet of water.

Electrical Progress.

Niagara Falls Power Transmission.

The first step toward the actual transmission of the power of Niagara Falls over any considerable distance has been made, and Buffalo will be the first city to benefit by it. By November 4th, '96, the cars of the Buffalo Railway Company will be driven by the electricity generated at the power house by the side of the great cataract, and the transmission of its power over a long distance will have become an accomplished fact. The system of transmission employed is the three-phase system, developed by the engineers of the General Electric Company; the transmission can be thus effected over three wires. In the two-phase, four wires would be used to convey the same amount of power. The contracts were made between the Cataract Construction Company supplying the electricity and the General Electric Company, and between the latter company and the Buffalo Power and Conduit Company controlling the supply and distribution of the Niagara power in Buffalo, and the Buffalo Railway Company.

The contract with the Cataract Construction Company covers three of the air-blast type transformers. These will be the largest transformers ever constructed, and will step-up the Niagara 2200-volt two-phase current to either 11,000 or 22,000 volts three-phase. Any two of the transformers together will deliver 2500 H. P.; the third is a spare one. It is the intention of the Cataract Construction Co. to commence transmission operations at 11,000 volts, and later to increase the capacity of their transmission system by increasing the potential to 22,000 volts. The transformers will be designed and insulated to withstand the latter pressure. The pole line will be erected by the White-Crosby Co., and will have capacity sufficient to transmit 40,000 H. P.

For transforming the power down and converting it into that suitable for street railway purposes the Power and Conduit Co. purchased four static transformers of about 360 H. P. each and two 500 H. P. rotary converters. The transformers will reduce from the line potential of either 11,000 or 22,000 volts to 400 volts, at which voltage the three-phase current will be turned into the rotary converters and then converted into direct railway current of 550 volts. The latter will be compound wound, and will operate in multiple with the steam-driven generators, supplying the balance of the power necessary for the operation of the railway system. They will be of the iron-clad type with steel frames, with collector rings for the three-phase current at one end and a commutator for the direct current at the other. They will have six poles and will run at 500 revolutions per minute, and are similar to that placed in the Niagara power house to furnish current to the Buffalo & Niagara Falls Railroad.

The Rod Type of Trolley.

The name "trolley," originally and properly applied only to a trailing grooved wheel at the end of a pole, afterward became synonymous with an electrically propelled car, because it was by means of such a wheel that nearly all such vehicles obtained their supply of current from the overhead wire. In order to evade the patent on that device, however, a revolving rod (or slender cylinder) is substituted for the wheel on many European roads. The rod is 18 or 20 inches long and slides to and fro as the car rocks, goes around curves or meets switches. Contact with the source of electricity is thus preserved effectually. It is not necessary, therefore, to provide the pole at its base with means for swinging sideways. The up and down motion is sufficient for all practical purposes. As with the present style of trolley, this new one is forced upward against the wire by means of springs connected

with the pole. The cylinder is mounted in the fork on dry ball bearings, inasmuch as the introduction of oil there might interfere with the flow of the the current. Oil is one of the best insulators known. As yet this type of trolley is but little used in America, although it was found desirable to introduce it on the Brooklyn & New York Bridge Railway for lighting purposes. It is probable, however, that in time it will come into service in this country for supplying power also to cars.

Practical Information.

SCARCELY a day passes that many persons do not, in some way or other, get a scratch, a small cut, or a bruise that may break the skin. In most instances not the slightest attention is paid to this beyond the temporary annoyance of the pain and the possible irritation when the hands are put into water, or some subsequent blow in the same spot brings an exclamation on account of the hurt. This, while a common practice, is by no means a wise one. The air is full of floating disease-germs, especially the air of cities and towns, and an injury of this sort, be it ever so slight, might furnish excellent breeding-ground for some deadly bacteria. It is a good plan always to keep a bottle of prepared carbolic acid and glycerine, and frequently touch all bruises or sore spots with it. This is one of the most convenient and effective germicides imaginable. It is said by excellent medical authority that the use of this preparation would prevent half of the contagious diseases that afflict the country. It is believed that many cases of fever and other serious ailments can be contracted by a floating germ coming in contact with the abraded skin. Once snugly lodged in this most congenial dwelling-place, the germ multiplies with amazing rapidity and soon overruns the entire system. Therefore, whenever there is a bruise or scratch, or any injury of this sort, germicidal applications should be at once resorted to.

ALL fruits with skins on should be washed and peeled before eating—especially fruits exposed on the streets, and where dust and flies can have access to them. Few are aware of the danger of food contamination by flies. They are great scavengers and are not at all choice as to what they eat, nor where they step. They pass at one bound from an infectious carcass, a foul ulcer, or a mass of diseased sputum or reeking filth to the apple, pear or peach, and, with dirty feet and dirty proboscis, run over it and contaminate it. Hence, all such fruit should be first washed and dried and then pared, if possible. Even food to be cooked ought, for cleanliness sake, to be washed if cooked with the skin on.

WHEN a very small meteorite enters our atmosphere it becomes incandescent and is visible for a short time as it moves along its path, constituting what is called a shooting star. When the meteorite is larger and when it becomes involved in a denser portion of the atmosphere, it presents the appearance of a brilliant planet; it is frequently followed by a train of greater or less extent, and oftentimes it explodes with more or less violence; it is then called a fire ball. When the meteorite is still larger it frequently escapes destruction in the atmosphere and falls to the earth, either as a unit, or, after one or more explosions, in fragmentary portions; the masses that reach the earth are called aerolites.

THE following recipe has been found specially effective in stubborn cases of rheumatism: One new egg well beaten, half a pint of vinegar, on ounce of spirits of turpentine, half an ounce of camphor. These ingredients must first be beaten together thoroughly, then put in a bottle and shaken for ten minutes, after which it should be corked tightly to keep out the air. In half an hour it will be ready for use. It should be applied three or four times a day, and for rheumatism in the head it should be rubbed on the back of the neck and behind the ears. It will keep for an indefinite time, and, in fact, is rather improved by age.

INFLAMMABLE gas that will readily ignite by the application of a match is sometimes found in the hollowed trunks of old trees. Some stories of "gas trees" have recently appeared in the public prints, and explanations offered that it is the ooze of natural gas from the reservoirs in the earth, penetrating these old tree trunks up through the ground. This is fallacious. Inflammable gas really does exist in many old trees, but it is of the trees' own manufacture from its own carbon and hydrogen.

TO BORE a hole in a strip or sheet of thin glass the following method is said to be successful: Place a cake of wet clay upon the glass, and then make a hole through the clay of the desired size, laying bare the glass at the bottom of the hole. Then pour melted lead through the hole, and it will drop through the glass, making a round aperture. The explanation is that the sudden application of heat cracks the glass in a circle corresponding in size with the hole in the clay.

A CURIOUS application of the Roentgen rays has been made by two noted British scientists. They took true and false diamonds for the experiment, and obtained entirely different results. When the rays were applied to the false diamonds only indistinct images appeared on the photographic plates. The real diamonds, however, allowed the rays to pass, and, as a result, much darker pictures were produced on the plates. Thus a certain method of discovering the quality of diamonds is assured.

A CHEAP and sure remedy for hard or soft corns is said to be turpentine. One who has tried it says if a little of this is rubbed on a corn every evening for about two weeks the corn and roots will both come entirely out and will not re-appear in any form.

ONLY seventy years have elapsed since the first railway in the world was finished. During that comparatively brief period 400,000 miles have been constructed.

AT Cape May, N. J., last week a speed of over ninety-four miles an hour was reached at the trial of the Holman friction-geared locomotive drawing a train over the South Jersey Railroad.

How He Ships His Bullion.

"Bet your life I won't do as W. A. Nevills does when my mine pans out as rich as the Rawhide property," remarked a young Stocktonian to-day, who has recently become interested in mining.

"How is that?" asked a *Mail* reporter, to whom the remark was made.

"Why," said the speaker, "Nevills does not trust his bullion to Wells, Fargo & Co., but brings it to this city in a buggy, and from here takes it to San Francisco. Several weeks ago he brought $137,000 in bullion to this city, and while here called at Hammond & Yardley's store. The bullion represented a three weeks' product of the mine, which is one of the richest in the country. Later he brought $92,000 worth of bullion to the city, and hence to San Francisco by boat. Of course, Nevills is accompanied on these trips by a shotgun messenger."—Stockton, Cal., Mail.

Recently Declared Mining Dividends.

Bullion-Beck M. Co., Utah, $15,000, payable to-day—a total of $2,075,000.

Le Roi, Rossland, British Columbia, $25,000, payable to-day (15th), making $200,000 to date.

Butte & Montana, Montana, $450,000, payable on the 17th inst.

Gold Coin, Colorado, $20,000, paid on the 10th inst.

Mammoth, Utah, $20,000, paid on the 1st inst.

Quincy, Mich., $300,000, payable on the 17th inst.

The 43rd Great State Fair of California

WILL BE HELD AT

1896=SACRAMENTO=1896

THREE WEEKS. - - - - - - - SEPTEMBER 1st to 19th.

The Soil Products of this great State will be a leading feature.

The Mechanical Display will be as attractive as usual, and made up of live exhibits of machinery and neat designs of goods.

The Live Stock will form a most important division of this season's exhibit; competitive tests will be held among the various dairy and beef breeds of cattle.

The Poultry Exhibit will form one of the most interesting features of the Fair.

The Racing Programme will be of unusual excellence, inviting contests between the highest class of horses.

The Exposition Building will be a blaze of electricity, affording every advantage for the exhibition of all kinds of articles.

Electric Motive Power generated at Folsom, twenty-two miles distant, will turn every wheel and furnish brilliant lights for the entire exhibition. Space, power and light furnished free to all exhibitors.

The Mining Interest will be represented by an exhibit of ores and a series of rock-drilling contests, showing accuracy and dispatch in this kind of work.

Cassasa's Great Exposition Band will give high-class concerts at the Pavilion each evening.

The Manufactures of California can meet the consumer to a better advantage at the State Fair, by reason of its varied attractions, than at any other public gathering in the State. Exhibit your goods and let the people know what is made at home.

Free transportation for exhibits and reduced rates of fare will be given on all railroads. Address the Secretary for information of any character Premium lists now ready.

EDWIN F. SMITH, Secretary. **C. M. CHASE, President.**

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

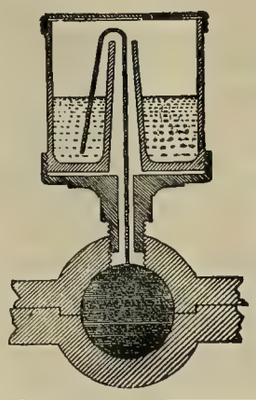
Positively Reduces Oil Bills 75 Per Cent.


THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capiliary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**
Read One of the Many Testimonials:
UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*
K. J. McHUGH, 25 New Montgomery St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.
1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

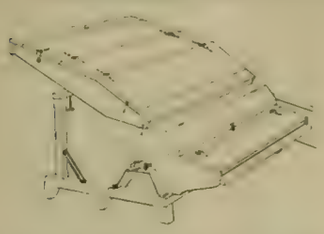
When Writing please mention the MINING AND SCIENTIFIC PRESS.



The above cut represents the Victor Amalgamator for mill use. Especially adapted for fine gold and slimey ores. It will positively save 95 per cent of all free gold, no matter how fine.

The other cut represents the Victor Amalgamator for beach sand and placer use. Is the greatest gold-saving machine ever invented and uses less water for the same amount of work than any other machine in use.

Office and Works:

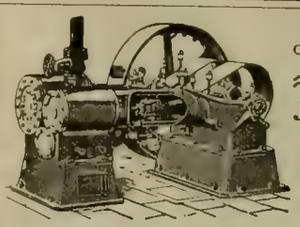
129, 131, 133 & 135 FIRST STREET,
SAN FRANCISCO, CAL.

DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

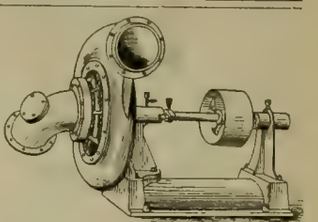
ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.



WRITE FOR CATALOGUE NO. 15.

Jackson's GAS —AND— OIL ENGINES.



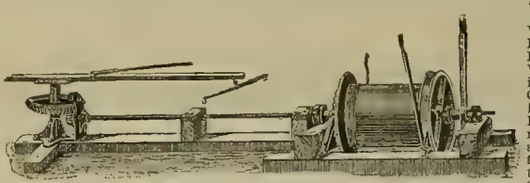
Cross-Compound Steam Engines and "Whirlpool" Centrifugal Pumps

For Irrigation, Drainage, Dredging, Mining, Etc. Capacities from 50 to 50,000 Gallons Per Minute.

BYRON JACKSON MACHINE WORKS,
625 Sixth Street..... San Francisco.

KROGH MANUFACTURING COMPANY,

Successors to the San Francisco Tool Co.'s Mfg. Dept., builders of Engines and Centrifugal Pumps for Irrigation and for Mining and Water Works. These Pumps can be operated by horse power, water power, steam, gasoline or electric motors.



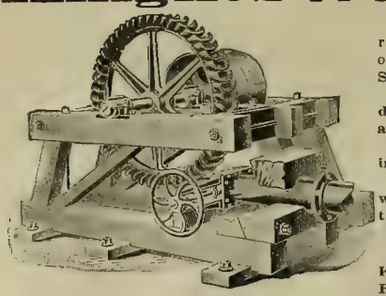
Horse Power Mine Hoist.

Horse Powers

Triple-Acting Pumps, Deep Well Pumps, Cornish and Jack Head Pumps for Deep Mining, Horse Power Mining Hoists, Water Gate Valves up to 40 inches diameter, and Link Chain Elevators, Pipe and Pipe Fittings at lowest prices. Hydraulic Presses. We also manufacture Cyanide Tanks and Centrifugal Sand Pumps for filling and discharging them. These Pumps work the tailings to perfection and are made to handle small or large quantities.

Office and Works: 51 BEALE STREET and 9 to 17 STEVENSON STREET, SAN FRANCISCO, CAL.

Knight's Water Wheel.



The accompanying cut shows the general arrangement of Knight's Standard Water Wheel, of which there are hundreds in use in different States of the Union.

These Wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.

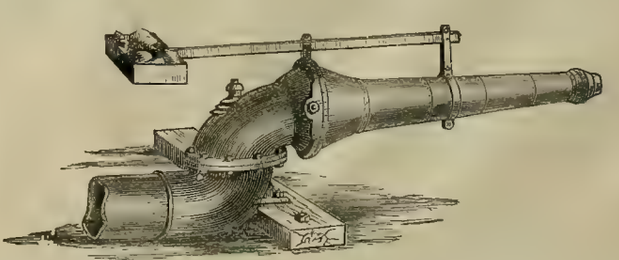
Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished with or without Governors. Highest regulation guaranteed.

For full particulars, send for descriptive catalogue.

Address all communications to KNIGHT & CO., Sutter Creek, Cal., or, RISDON IRON WORKS, Agents, San Francisco, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The shaft at the Gwin has reached a depth of 1335 feet and sinking has been temporarily suspended while stations are being cut at the 1300 and 1200 levels. As soon as the stations are in far enough to make it safe to work in the sump, sinking will be resumed. Grading for the 40-stamp mill is about completed and the contract for its construction will be awarded this week. Work on the mill will be pushed as rapidly as possible after the contract is awarded, and milling will be commenced before the rainy season sets in.

The Esperanza, formerly the Boston, on which work was inaugurated by Col. Robinson, is now owned by a company of Boston capitalists, who are operating the property in a business-like manner. Ten stamps have been added to their 20-stamp mill and this week 30 stamps will be dropping. They have a large body of low-grade ore which, with enough stamps, will make it a dividend-paying property. They have a large chlorination plant at the property.

Dispatch: At Amador Queen No. 2 five of the twenty stamps were at work in the Morgan mine, in Hunt's gulch, last Tuesday, on rock taken out of this mine. There is also a new process to save the light "shine" that escapes the concentrators; this is a smooth floor covered with cloth canvas to catch this article, which escapes any and all concentrators at the mills. Thirty men are now on the payroll, and other men will soon be needed, when five or ten more of the stamps will be started crushing rock.

The Butte Basin tunnel is now 250 feet in length. The workmen in driving the tunnel have encountered a great deal of water. At one time 100 inches burst in upon them, and 50 inches is the least water they have at any time. They are now in softer ground, and will have to use timbers in their work as they progress.

Republican, August 8th: Last Tuesday five of the twenty stamps in the mill at the Amador Queen were started on rock from the mine, and it is expected that five or ten more stamps will soon be dropping.

The Belden mine, about two miles above Volcano, closed all operations on Saturday because the machinery was not of sufficient capacity for the work.

At the Reward mine, near Pine Grove, which has just changed hands, ten more stamps are to be added immediately.

Butte.

On the Magalia ridge near Nimshew, at the Puyderinktum, G. C. Higgins superintendent, the tunnel is 800 feet in pay gravel.

Work on the Oro Fino has been suspended, owing to bad air during the hot weather. The main tunnel is in 2800 feet; the branch tunnel 1000 feet. On reaching 2000 feet in the main tunnel the air gets so bad that the lights go out. When the mine closed, good pay gravel was being taken out from the channel. The manner of working the mine is peculiar. Up in the canyon is a reservoir and from this a ditch leads to a bulkhead. From this a pipe extends down the hill and into the tunnel, which is carried up to the face. The gravel is thus washed in the tunnel and a small flume carries off the water and debris.

At the Matherson quartz mine, D. H. Matherson owner and superintendent, the rock is broken up with sledges and is said to pay $50 per day for the men employed.

At the Forks of Butte the John Dix mine tunnel is now in 1000 feet; R. Diller superintendent.

The Magalia or Pershbaker mine employs thirty-five men. The shaft is down 500 feet and connected by a tunnel with the old works. J. T. Morkel is superintendent.

The Wilson mine is sold to an English syndicate; the machinery used at the Golden Butterfly has been hauled there.

The Ramona quartz mine is owned by Supervisors Morgenstern, Hughes and Benjamin and Charles H. Ford of San Francisco; the latter superintendent; lies one and one-half miles southeast of Magalia. A new tunnel 62 feet long has been run on the mine and a mill will be erected this fall to crush the ore.

At the Golden Summit, Chas. G. Kane is superintendent. Twenty men are employed.

Mercury: Mr. Geo. H. Evans, manager of the English Syndicate mines, is doing rapid work.

The old flume over the Morris Ravine that had been standing over sixteen years recently collapsed. The flume was 1250 feet long and 104 feet high at the highest point. It has been replaced by 34 and 36 inch steel pipe.

The pumps have started in the Golden Feather limited, lifting water into the canal, and making a lift of 25 feet more than last season.

They have begun sluicing the gravel in this claim. Two new steel derricks are in operation, capable of lifting boulders of four tons weight with a hoisting speed of 100 feet per minute on a single line; and with three lines, boulders weighing ten tons are easily handled with a hoisting speed of 40 feet per minute.

In speaking of the Banner, Mr. G. H. Evans says: "Have found the vein on the 1000-foot level; vein is fully 9 feet wide. Have discovered a new shoot of ore in the 700-foot level assaying $1737.70 per ton."

Register: J. H. Thomas, of La Porte, is pushing developments at the Bald Mountain mine rapidly. The tunnel has been driven under this mountain for the past nine years and is in 6800 feet. After Mr. Thomas got possession of the mine, he started to crosscut at 3800 feet, and, after running 800 feet, struck the channel. He raised 142 feet, and is now making another upraise of 50 or 60 feet; 12 men are working on eight-hour shifts, and it is believed the mine, when opened, will be very rich.

The Cherokee Mining Company is putting in a new head dam on main Butte creek, about eight miles northwest of Powelton. The dam will be 100 feet long and 40 feet high. About 40 men are employed under Luther Wakeham, who is superintending the work.

At Forbestown a heavy flow of water is reported in the Goldbank tunnel, which is considered an excellent indication that the ledge is not far off.

El Dorado.

(Special Correspondence).—The new mill and tramway on the Starlight are ready for operation. The machinery will be in motion when these lines are in print. There are about 700 feet of underground work completed and about 14,000 tons of ore ready for milling. There are ten stamps. The property is seven miles southwest of Placerville.

Work has been begun cleaning the old tunnels on the Champion and Chaparrel, in the Kelsey district, eight miles north of here. These are old properties of good record. They are now owned by Miss M. A. Kelly, who, in addition to being one of El Dorado's brightest teachers, is rapidly taking a place as an expert in the mining field.

The Big Sandy is running a drift on the 235, pending some improvements in the machinery lately placed in the hoist.

Work is progressing favorably in reopening the old Union, one mile east of town. This is the property of S. H. Maginness.

The Lone Star, four miles southeast of here, is showing up splendidly. The tunnel is in 180 feet, from which they are sinking on a 6-foot ledge of very fair ore.

Channel mining is receiving attention to a marked degree in the eastern and northern parts of the county, and is proving a successful enterprise, despite the obstacles met with.

The erection here of a cyanide plant, combined with an assay office and a 2-stamp test mill, is contemplated by an enterprising San Francisco party. It will prove a paying investment. The amount of work in these branches sent out of here is surprisingly large.

Upon the advent of cooler weather, the town is again being visited quite numerously by mining capitalists and experts in search of properties.

A development company, with a reasonable amount of capital, would find this an exceptionally good field for operations. Good prospects can be had upon favorable leases, long-time bonds and comparatively low prices. The properties are here, but capital is lacking to develop them.

G. W. J. Mitchell has been placed in charge of D. H. Jackson's Lone Star property.

Clyde Jackson, until recently assistant superintendent of the Larkin mine, has gone to take a year's course at Berkeley.

Geo. M. Clark, having completed a course at Berkeley, after some years of practical mining under his father's tutelage, has been placed in charge of opening a large gravel property here.

Placerville, Cal., Aug. 12, '96.

Kern.

The Mammoth, Little Mammoth and Tom Lane mines are reported purchased by the Los Angeles Gold Mining Company, who will put up a 10-stamp mill to be worked by water power from the Kern river, and a tramway to carry the ore from the mine to the mill.

Nevada.

Transcript: By the purchase of the Spanish mine, the Champion Company still further extends its possessions and field of operations. The company are now employing over 200 men at their mines and works on Deer creek and have 70 stamps pounding away day and night on good ore. With the 10 stamps at the Spanish running, they will have twice the milling capacity of any mine in the district.

San Bernardino.

A 20,000-pound boiler, 300 H. P., has been ordered for the Banner mine.

A 10-stamp mill is being erected for the Green Lead mine in Holcomb valley.

San Diego.

A deed was filed in San Diego last week by which D. K. Allen transfers to G. W. Ireland, for $30,000, the Golden Dream and fourteen other mines in Old Picach district, on the Colorado river.

The Escondido Gold Mining Co. has resumed work with a full force of men.

W. W. Stewart, receiver for the Golden Cross mining property at Hedges, has filed an inventory of all personal property belonging to the company and taken possession of by him as receiver. The property consists of groceries worth $3098.06, dry goods $1870.40, boots and shoes $1944.35, notions $276.77, drugs $262.07, grocery and glassware $172.85, hardware $562.60, mechanical supplies $3547.05, wood $4500, 13 mules, 5 horses, 5 wagons. He has been directed by the court to report the quantity of ore taken from each mine and the amount milled each day, the amount of bullion shipped for each cleanup, and other matters pertaining to the receivership.

Shasta.

The Minnesota mine, Spring creek, near Copley, is about to resume operations; J. W. Parmelee manager and superintendent.

Siskiyou.

(Special Correspondence). — The Siskiyou hydraulic gold mines, the property of F. Beaudry of Weaverville, are located on the south fork of Scott river, about 40 miles southwest of Yreka and 25 miles from Gazelle station, and consist of 1000 acres prospected through shafts from 4 to 25 feet in depth, showing that the gravel runs from 30 cents to $1 per cubic yard. There are four monitors on the ground and 4500 feet of pipe, and extensive preparation is being made to work this claim on a large scale. A ditch to convey 3000 inches of water, now under way, will be completed by Sept. 1st. But five men are employed at the mine at this writing, it being temporarily idle during the erection of a sawmill.

The Beaudry hydraulic gold mine, owned and managed by F. Beaudry, is located just opposite the above-named hydraulic plant, on the south side of the river. It consists of 1600 acres of patented ground. The prospecting has proved satisfactory to its projector. On this mine are three sets of derricks with cables run by water power, a sawmill, miles of ditches and hydraulic pipe, an electric plant, and twenty buildings. The principal ditch leading to this mine is three miles long; the water is taken from Jackson creek, one of the main branches of Scott river. It furnishes the mine with 2500 inches of water nearly the whole year round. A telephone is now being put up to connect this mine with Callahans Ranch P. O. Ten men are working with two monitors. L. P. Mc.

Trinity.

(Special Correspondence).—The Brown Bear mine, at Deadwood, twenty miles south of Weaverville, Chas. Dobler superintendent, covers an area of over one mile square, and consists of a number of ledges and a 15-stamp mill with four concentrators run by steam power. It is pierced by six tunnels, one of which extends entirely through the mountain and is over a mile in length, the others vary in length from 2,200 to 3,000 feet, through which the present development is being carried on. Forty men are employed in mine and mill. Thirty tons of ore daily pay from $5 to $10. A portion of the mine is worked by leasers. The ore so mined is said to pay from $30 to $75 per ton, carrying 2% sulphurets.

The Baily group of mines, consisting of the consolidation of fifteen different claims, owned and managed by C. W. Smith, is on Canyon creek, twenty miles north of Weaverville. There are four tunnels, one above the other. The top one is in 200 feet, the second 100 feet, the third 75 feet and the fourth 75 feet. About 100 feet of stoping has been done in the two lower tunnels. A mill test of 500 tons averaged $28. The sulphurets, which are of a high grade and constitute about 2 per cent of the output, have not been saved in the past. They run $512.64 in gold and $34.63 in silver. Two concentrators are now being put in.

Dedrick & Smith quartz mines, owned by C. W. Smith and others, is on Rattlesnake creek, thirty-five miles west of Weaverville; six locations; ledge pierced by a tunnel in 50 feet, that taps the ore body about 50 feet from the surface. Assays from this group of mines show $20 gold and 21 ounces silver. This is known as Rattlesnake district, an entirely new camp, and twenty-five miles from a wagon road. Several claims were staked out this season.

De la Cie Fse Des Placers Hydrauliques de Junction City (The French Company of Placers Hydraulics of Junction City), a corporation; capital stock 2,000,000 francs ($400,000); principal office Paris, France; E. Cumenge president; F. Beaudry resident director; E. Saladin, managing director and superintendent—has property consisting of 1600 acres, 560 of which have been patented, one mile west of Junction city, (extending up to the town site) and twelve miles west of Weaverville. It consists of a series of benches of an ancient channel in and near the Trinity river, of more than ordinary richness and runs from a few feet to 250 feet in gravel. They are working this mine by a very extensive and systematic hydraulic process. The source of their water supply is in Canyon creek, nine miles north of the mine, conveyed by ditches, flumes, etc., with a constant supply of 3,000 inches of water, which they are just now engaged in increasing to 6,000 miner's inches. There are also five bedrock ditches on this property aggregating over a mile in length. They have a dozen large monitors, seven of which are in position, and from two to four in constant use day and night with 8-inch nozzles using 1500 inches of water under an effective pressure of over 200 feet. About 7000 feet of pipe running from 34 down to 15 inches, conveys the water from the ditches and reservoirs to the monitors. A tunnel 200 feet in length (previously 400 feet long, but reduced by floods) directs the debris by a short route to the river from the mine. They have three sets of derricks, with tramway cables run by water power, for clearing the mine of the larger boulders. The whole property is lit by incandescent lamps and arc lights, from their electric plant. Their mining season for washing is about eight months, during which time they employ 35 or 40 men, and remove about 1,200,000 cubic yards of gravel. A portion of this mine is worked the year round. The output, which is a delicate question to ask any mine manager about, from this mine is said to thoroughly satisfy the stockholders, at least the property in not for sale.

The Haas placer mine, owned and managed by F. G. Haas, is one mile east of Junction City and consists of several ancient river beds or channels, near the Trinity river and next above and south of the French mine above mentioned. It contains 240 acres in area, 160 of which are patented, the pay gravel of which is from 2 to 50 feet in depth. The water supply for this mine is taken from Clear creek and brought by a ditch 3½ miles long. It supplies 1000 miner's inches of water for about six months of the year. Some cement has to be blasted, but it is trifling compared with the cubic yards of gravel handled in this mine. The bedrock, where exposed, is slate and porphyry. Mr. H. has two monitors in position, and one in constant use. A partial cleanup is made once a month and completely once a season, about six months. Six men are employed, and with this force, during a run of five months in 1891, Mr. H. took out $29,000. He says this season will equal 1891.

The La Grange Mining Company—a corporation; capital stock, $5,000,000; principal office at Denver, Colo.; E. Saladin, general manager; Wm. Ratford, superintendent,—has a property which begins three miles nearly west of Weaverville and extends one and a half miles farther west, to within five miles of Junction City, where the principal work of this corporation is now going on. The property of this company, purchased from the Trinity Gold Mining Co. about three years ago, consists of 400 acres of patented mining ground and is out of the usual line of gravel deposits, being a mountain of gravel. They are now piping against a bank 300 feet high, with over a mile of similar ground back of it, facing them at an angle of 40° up the mountain, and all in pay. Their water right, as a whole, is among the largest in the State. It consists of the "West Weaver," "Rush Creek" and "Stuarts Fork" water rights, the farthest source of which is in Stuarts Fork, a distance of thirty miles. This furnishes them with from 3000 to 4000 miner's inches of water the year round. They are at present engaged in constructing a flume, with some ditch, eleven miles long from Stuarts Fork, a branch of the Trinity river, to a point on that stream, where they cross the same with the aid of about one mile of pipe, at which place they are piercing the mountain with a tunnel that will be 8400 feet long when completed; they are now in a little over 2000 feet. This tunnel will save them about eleven miles of ditch, flume and pipe. From this point their water will be brought by ditch, tunnel, flume and pipe to Rush creek, and from this point about fourteen miles more of ditch, flume, two pipes and another tunnel to reach the mine—in all, about twenty-eight miles of costly watercourse. They have three large monitors; also two derricks that have a capacity to lift from three to four tons each, and two cables or tramways to transport the larger boulders out of the mine; also a 6-foot flume, with undercurrents, about 500 feet in length. They are working about fifty men. This company expended for construction work alone during last year nearly $100,000, without an assessment.

The Weaverville Creek Mining Co., previously a corporation, now personally owned by H. Junkans of Weaverville, adjoins the townsite of Weaverville on the south, in the bed of Weaver creek; it consists of 260 acres of patented ground. At present only the banks of the stream are worked, owing to the quantity of water in the creek and slight fall in the grade. Mr. J. is working eleven men with one giant and is satisfied with the output. A tunnel is anticipated for this mine, that by running through an arm of the mountain one and a quarter miles 75 feet fall can be obtained and five miles of the bed of the creek exposed, which is probably the richest in this end of the State. The estimated cost of this tunnel is $100,000

The McMurray & Hupp placer mine, owned and managed by those men, is half a mile east of Weaverville and consists of an ancient channel of about 200 acres of patented ground. They have three giants in position, working one at a time, using 3500 inches of water, 500 of which is run through the pipe and 3000 over the bank. In early days this mine was run as a drift claim and is said to have paid well. They have their own water ditch, four miles long, the source of the supply of which is in East Weaver creek. They have on the mine about 4000 feet of 13-inch and 15-inch pipe and about one mile of 4-foot flume with 2¼ inches fall to 12 feet. They employ from ten to fourteen men, run from six to seven months, and clean up once a year.

The Minersville Hydraulic Mining Co., a corporation, capital stock $1,200,000; principal office at Weaverville; property twenty miles north of east of Weaverville; Count de Kergorlay of Paris president; F. Beaudry resident director and vice-president; and E. Saladin general manager; contains over two sections of patented mining ground, situated on the principal ancient channel of this county. For depth of gravel and completeness of outfit this mine is considered second to none in the State. Their water right consists of 6000 inches of water taken from the east fork of Stuarts fork of the Trinity river, seven miles north of the mine, conveyed hither by ditches and flumes. By the aid of reservoirs they are able to mine the whole year round. This mine is equipped with six large monitors, two of which have an 18-inch inlet. They have an electric plant, telephone, two derricks with cables and four more derricks on the grounds ready to put in.

The North Star quartz mine, owned and managed by James Mabury, is one and one-half miles southwest of Coleridge, twenty-five miles northwest of Weaverville, and consists of a group of six claims, with five different ledges, all of which run nearly north and south and dip west between walls of granite. They have been pierced by tunnels, varying in length from a few feet to 360 feet. The ore bodies run from 12 inches to 3 feet in thickness. The Little Chief, one of the claims of this group, has had considerable work done upon it, stoping in each direction on the vein. This mine is equipped with a 10-stamp mill and three concentrators run by water power. The mine and mill furnish employment for fifteen men the year round. With this force twenty tons of ore are mined and crushed every twenty-four hours. The rock is free milling, and averages $11 per ton, carrying from 2% to 3% of sulphurets.

The Strode quartz mine, owned by Strode Bros., J. Strode superintendent, is one and one-half miles from Carrville, five and one-half miles from Trinity Center. It consists of four claims. The hanging walls are porphyry, the footwalls are diorite. The ledges run from 10 inches to 4 feet thick. This group of mines is being developed by five tunnels—one above the other—varying from 40 to 600 feet in length. They have a 5-stamp mill with one concentrator, run by water power. They own, in connection with this mine, the Old Snow Gulch Ditch, two and one-half miles long, that was built in the early fifties. The ore is free milling, carrying about 2% sulphurets. They employ twelve men and mine and mill seven and one-half tons of rock every

twenty-four hours. This is also a bullion-producing mine, but information regarding it is scarce.

The Ruby Queen mine, owned by R. McLeod & Co., two miles northeast of Carrville, five miles north of Trinity Center, consists of four claims, or 6600 feet in length, free-milling quartz averaging $5 per ton.

The Buckeye group of placer mines, D. F. Weed, superintendent, is on Buckeye creek, two and a half miles north of Trinity Center, and consists of ten claims aggregating 200 acres in area. This property has been prospected by a shaft 40 feet deep sunk to bedrock. It averages 13 cents to the cubic yard from top to bottom, and portions of it would pay to drift, but so much better to hydraulic that the mine is to be worked by that method. They have located a water right, and San Francisco parties are to begin active work upon this property with a full force of men. It is temporarily idle.

The Vollmers & Doty gold quartz mine, owned by themselves, six miles from Trinity Center, G. Doty, superintendent, is pierced by a tunnel in 92 feet, that taps the ledge at 120 feet from the surface, showing an ore body 8 feet thick. They have begun to drift each way on the ledge and have a fine prospect for a paying mine.

The Adelaide quartz mine, owned by Postlethwaite Brothers & Gillett, is on the north branch of Copper creek, four and a half miles from Trinity Center; Robt. Postlethwaite, superintendent. This property consists of two claims of 1500 feet in length each. The ore body runs east and west and pitches to the north; a serpentine hanging wall and a diorite footwall, with a 2½-foot ledge of high grade ore carrying some sulphurets and iron and running about $40 per ton in gold. A shaft is being sunk and a tunnel to be started to crosscut the ledge. They have their own water right and feel highly elated over their prospects.

The Forget Me Not mine, owned and managed by Geo. L. Carr, is south of the Strode mine, five and a half miles north of Trinity Center; ore a 12-inch ledge of high grade. It is being developed by two tunnels, one above the other. The upper one is in 200 feet and the lower one 300 feet, with an upraise of 100 feet in the latter. They run an arrastra, which has a capacity of one and a half tons a day. Steps are now being taken to erect a 5-stamp mill.

The Altoona Quicksilver Mining Co. is a corporation, with principal office in San Francisco. This property, that has been in litigation for about fifteen years, is reported to have reached a basis of final settlement, to be proclaimed in the near future. J. P. Stidger is the superintendent. This corporation's works and mine are located seventeen miles north of west of Castella and twenty-two miles north of east of Trinity Center. It consists of an irregular shaped body of mining land, 1200 feet by 1500 feet in area, covered by U. S. patent. Unlike most other mines of this character (cinnabar) it exists in regular ledge form. This ore body runs nearly north and south between walls of porphyry, and, unlike a quartz mine, it dips to the west, the country rock being serpentine. The "gangue" or ore body is a mixture of "blue porphyry," lime, spar and clay, 250 to 300 feet in length and irregular in width. The development consists of a shaft down 350 feet, with some 200 feet of crosscutting and stoping. Their improvements consist of a fine hoisting works, with pumping plant, run by steam; a roasting plant, condensers, and retort. The latter has a capacity of thirty tons every twenty-four hours. They usually work from sixty to seventy men; at present they are employing one hundred men. They are just now preparing to use water power and an air compressor. This mine has a permanent look and indicates a good paying property.

The Copper Queen, a copper mine, owned by G. O'Shea, F. Dimock and T. J. Baker, is on Copper creek, five miles east of north of Trinity Center. The ledge averages 40 feet in width and is said to contain 15 per cent copper, $4 gold and one ounce in silver per ton. David Hunt is superintendent. This company owns a water right, and a wagon road to the mine. A shaft has been sunk 75 feet and a crosscut tunnel run in 300 feet. Active development work has just been begun on this mine after a long season of inactivity.

The Headlight gold quartz mine, in Red Gulch, 3½ miles from Trinity Center, is owned by Baker & Dimock, and consists of two parallel claims of the usual 1500 feet in length, the ledges of which run east and west and dip north. A porphyry hanging wall and a slate footwall inclose one of the ore bodies of this company, 150 feet wide, the croppings of which look like a small mountain. A crosscut tunnel was started some time since and run in 75 feet, expecting to tap the ore body in 50 feet more, at a depth of 152 feet from the surface. The rock is low-grade, but they have an immense body of it. Active work will begin on this mine Sept. 1st.

The Hatchet Creek placer mine, owned and personally managed by A. P. Haskin, situated half a mile northwest of Trinity Center, consisting of 72½ acres, 54 of which is covered by U. S. patent, is an ancient channel cut down by the present living waters of Hatchet creek. It is mined by the hydraulic process. Mr. H. has his own water ditch, which is six miles long and has its source in Buckeye creek, furnishing him for seven or eight months of the year with 350 miner's inches of water. Connected with the mine is a bedrock flume, 1200 feet long and 700 feet wide, of 10 and 12-inch pipe. The gold taken out here is very coarse, running from the size of a wheat grain to pieces valued at $60. Cleanups occur during the month of August, and but once in a season. The present owner has worked this mine for the last fifteen years, and he says the output has always been satisfactory.

The Bloss & McClary placer mine, owned and managed by the two men for whom the mine is named, adjoins the town of Trinity Center on the northwest. It contains an area of 660 acres, including a portion of the town site, of the principal ancient channel that runs through this part of Trinity county. About one third is still unwashed, the pay gravel upon which runs from 6 to 40 feet in depth. Their water rights combined furnish them with 3000 miner's inches of water, viz: a ditch, seven miles long, that they own personally, furnishes them with 2000 inches, and a ditch, two miles long, in which they own a one-half interest, furnishes them with 1000 inches.

The Chinese hydraulic placer mine, located adjoining the Bloss & McClary mine on the south, is owned by the Quong Ah Quong Co., a corporation represented by eighteen shareholders. This company's property consists of 80 acres of mining ground, on the main ancient channel, and 60 acres of dumping ground, all covered by U. S. patent. They own a water right consisting of a ditch three miles in length furnishing 1000 inches of water, and 1½ miles of bedrock flume 5 feet wide, that empties into the Trinity river, also, 450 feet of 15-inch pipe; run one No. 4 "giant" and have a self "shooter," with a 4x6 foot outlet, with twenty minute pulsations. This company work eighteen men; their annual output of gold averages about $15,000 for seven to eight months' run. They are known to have taken out $24,000 in a single season, from 1½ acres of ground. The principal office of this company is at Weaverville, Ah Deen is general manager, Ah Gee is superintendent at Trinity Center.

The Ella May mine, owned and managed by John Larsen, a drift mine, located at the mouth of Hatchet creek, half a mile north of Trinity Center, and consisting of 40 acres of patented land, contains from 4 to 5 feet of gravel that pays to drift. It has paid from $12 to $60 to a set of timbers, 4x6 feet. It is worked through an incline shaft sunk to bedrock, 42 feet deep, equipped with a double cartrack, and run by an overshot water wheel. The mine has a drain tunnel 2200 feet long, and a small flume 300 feet in length extending to the river. This mine usually employs twelve men, is temporarily idle, but is soon to resume operations.

Coffee Creek Mining Co., a corporation, capital stock $500,000; principal office San Francisco; property located on Coffee creek, northwest of Trinity Center—the Reindeer, Gold Dollar and Blackwarrior locations, known as the Hill group of mines; E. A. Wagner, superintendent. High grade free milling quartz ledges run north and south and dip to the east. The walls of the Reindeer ledge are decomposed quartz and of the Blackwarrior porphyry. A shaft has been sunk on the former 30 feet, and a tunnel has been run in on the ledge 130 feet, which at this point is 18 inches thick. The Blackwarrior is being worked through an open cut, exposing a well defined ledge 4 feet thick. The ore runs from $50 to $67, carrying 2% of sulphurets. They own a ditch one mile long, have free water and timber; now working eleven men and expect to erect a 20-stamp mill this fall.

The Underground Treasure placer mine, the property of P. Holland and J. L. Coyle (P. Holland superintendent), in the east fork of Coffee creek, eighteen miles northwest of Trinity Center, consists of the consolidation of fourteen claims, extending in the bed of Coffee creek, up that stream, three and a half miles. It is probably the richest, certainly the most curious, formation for a placer mine in this country, and the method of working it a scientific study. This mine (which is the creek) contains apparently nothing but huge granite boulders and about 10,000 miner's inches of water; but it does contain some gravel, a little black sand, and much coarse gold. One piece weighing a little over 27 pounds of pure gold was taken from this mine on July 1st. The previous erroneous account of this find put it at 45 pounds. The pay ground in this claim is from 2 to 20 feet deep, including boulders. About a ton of giant powder is used during a season of six to seven months, to break up the rocks so that they can be washed down stream. It is worked in sections of about 300 feet at a time. A systematic dam is thrown across the creek and arranged as an "automatic shooter." The entire water of this creek is completely stopped for fifteen minutes at a time, backing the water so that they cover an area of about three acres. During this period a force of ten men work at drilling, blasting, etc.; but for the next five minutes they must escape to the banks of the stream to allow the shooter to empty, the opening of which in this mine is 12 by 16 feet, representing a front of 192 cubic feet of water. Boulders over 3 feet escape before this force like a football before an athlete. It would seem that gold and all would be washed out of reach, but not so; a perfect system of flume and undercurrents save it all. When bedrock is to be cleaned they throw a wing dam across the stream above that portion, and the object is accomplished.

L. P. Mc.

NEVADA.

NYE COUNTY.

In western Nye the Belvidere mine quartz mill is running.

Bell & Bray are building a 10-stamp mill in the vicinity of Ione. About seventy men are employed in that district.

Downey Bros. are developing gold mines in Sullivan district, with flattering prospects.

OREGON.

BAKER COUNTY.

The Frenchmen who bought the twenty-one placer claims on the Grande Ronde river paid $51,000. The Grande Ronde Placer Mining Co. is now in full and undisputed ownership and possession. T. H. Crawford of Union, who was the attorney for Paul Bozonni, received an equal share with his client, viz., $8000. E. L. Giroux, one of the promoters of the sale, got $8000. Woodley is the postoffice address of the new company.

At East Eagle the Eagle Creek G. M. Co., W. P. Keady manager, has a 10-stamp mill and three concentrators on $40 ore. The ore is conveyed from the mine to the mill by a pack train of fifty mules, two trips daily, ten tons each trip. The company intends soon to move the mill nearer the mine and add ten stamps.

WASHINGTON.

The Hydro Smelting & Refining Company has organized at Tacoma, capital stock $100,000, "to reduce iron and all precious minerals by a new patent process, for making iron direct from the ore, and smelting all precious minerals, no matter how rebellious the ore may be, without roasting or fluxing, for less than $1 per ton."

BRITISH COLUMBIA.

At Quesnelle Forks, Cariboo, the Horsefly hydraulic mine has completed fitting up pipe and hydraulic elevators. The question of water rights has arisen between the two Horsefly mines, each claiming to have the prior right to 2000 inches of water out of Mussel creek. This creek is now flowing at the rate of about 2500 inches, and of this amount the Horsefly hydraulic uses 1000 inches. There are as reservoirs three lakes - one four miles long, one eight and one nine miles, which, with proper dams, will hold back an abundance of water for both mines for the season. Each company thinks it the duty of the other to do this reservoiring; but as the Hobson mine has possession of the water, his company has the best of it. An injunction is asked restraining the Horsefly Hydraulic Company from taking out the water of the creek before it reaches his company's ditch head, which is about 500 yards below the head gate of the Horsefly hydraulic.

The Canadian Pacific M. & M. Co. will erect a concentrator near Ainsworth; contract price $10,000.

UTAH.

Salt Lake *Tribune*: Ajax has registered another strike. On the 200-foot level of the main shaft, which has been put from the tunnel level, and at a point 400 feet below the surface, ore has just been uncovered that yields as much as 2½ ounces gold per ton, in addition to 15 ounces silver and 6 per cent copper.

In Tintic nearly all the machinery of the new South Swansea hoist is in place and ready to run. The foundations of the buildings are completed, but it will take over a month to finish the hoisting works.

At a meeting of the board of directors of the Utah and Galena last week, the usual dividends were posted. The former will pay $2000, when the total will have advanced to $149,500, while the latter will distribute $3000, making a total of $46,000.

IDAHO.

Dividends have been paid by Cœur d'Alene mines as follows: Standard, $800,000; Poorman, $340,000; Helena and Frisco, $425,000; Bunker Hill and Sullivan, $150,000; Granite, $83,400; and Tiger, $180,000. The *Spokesman-Review* predicts that the mines of the district will this year produce from $7,000,000 to $8,000,000. It is said that if the owners of the Bunker Hill and Sullivan were to exert themselves, they could produce one-half of the lead product of the United States.

Avalanche: Silver City is quiet but prosperous. There are enough miners here to fill all demands, and but few idle men. More and better prospecting is being done this season than ever before. About 400 men are now on the pay-rolls of the various mining companies, making a monthly disbursement of about $36,000. Timber and wood contracts, freight and miscellaneous expenditures of the mining companies, will raise the amount to nearly double these figures.

WYOMING.

Two discoveries of mica of value have lately been made in Wyoming, says the Denver *Republican*. One of the properties is situated in the northeastern portion of Albany county, on the western slope of the Black Hills range, and the other in Carbon county, not far from the Battle Lake copper fields. Both properties are showing up well as the development work progresses, and it is reported that the mica will readily square 12 inches. The mica is perfectly transparent and free from iron stains.

MICHIGAN.

At Bessemer, Mich., the Tilden mine has closed down, completing the shutdown of the Rockefeller mines in that city. Nos. 6, 7, 8, 9 and 19 now employ just enough men to keep the mines clear of water. In a large number of mines the pumps have been taken out and the mines allowed to fill with water. The Gogebec range of mines are practically all shut down at Hurley, Ironwood, Bessemer and Wakefield. There are less than 1000 men at work on the range, where at one time there were over 8000 employed. The several mining companies have allowed their employes all unoccupied lands for farming, but army worms have destroyed the last hope of the miners of having at least vegetables for the coming winter.

NEW SOUTH WALES.

The annual report of the department of mines and mining, for 1895 gives the following table of the quantity and value of gold, silver, and copper produced prior to and during the year 1895:

	Quantity.	Value.
Gold mined prior to 1895	11,034,397.91 oz.	$196,851,163
Gold mined in 1895	360,165 45 oz.	6,316,459
Totals	11,394,563 36 oz.	$203,167,622
Silver, silver lead and ore exported prior to 1895	Ingots 6,676,591.02 oz.; Silver lead 344,380.77 tons.; Ore 600,893.10 tons	$ 91,685,472
Silver lead and ore exported in 1895	Ingots 550,142 oz.; Silver lead 39,687 tons.; Ore 190,192.95 tons.	$ 8,884,900
Totals		$ 100,570,372
Copper exported prior to 1895	Ingots 100,068 50 tons.; Ore & regulus 8,212.95 tons.	$ 31,355,450
Copper exported in 1895	Ingots 2,630 15 tons.; Ore & regulus 1,221 00 tons.	$ 665,390
Totals		$ 32,020,840

SOUTH DAKOTA.

Black Hills *Mining Review*: As development work progresses in the various mining localities new ideas in earth structures and mineralogical effects are continually suggesting themselves. For a long time prospectors and practical miners accepted the theory that within the siliceous ore belt the upper shale ore was the only object of value—that their chutes, if followed, would soon exhaust on their own level or change to a "vertical," but of late years, since prospecting on better informed lines has been presented and the work combined with thought, a decided modification of views has deposed a great many of the old ideas concerning the regularity and continuity of ore bodies, and instead of the "going down" or the "shooting up" process the continuity of the "ore floors" or "ore zones" of the blanket formation can be expected only when the surface, through igneous forces, exposes the same matter visible at the outcrop.

The Deadwood *Pioneer*, speaking of the Bald Mountain district, says: "The B. & M. ore train brings down to the Kildonan an average of 125 tons a day from the Welcome and the Hardscrabble, 35 from the Maggie and 15 from the Fannie—the smelter. The Elkhorn, Cyanide, Golden Reward and Big Bonanza bring to the smelter an average of 120 tons a day, 25 from the Clinton and 20 from the Portland. In addition to these regular shipments, both roads carry from 50 to 150 tons a day from mines that ship only once in two or three days.

The owners of the Pluma mine, adjoining the Hawkeye and Homestake, will reopen it shortly. Disagreements among the stockholders, which have been the cause of the suspension of work for several years, have been settled.

MONTANA.

The accumulation of tailings at the Iron Rod mill, Jefferson county, which has been accumulating for years, is to be worked at the rate of 75 tons per day.

COLORADO.

D. F. Burns, president of the Portland Mining Company, speaking of the prospective yield of Cripple Creek to a representative of the Denver *Republican*, said: "Unless the mine operators make up for lost time the aggregate output of Cripple Creek will be less this year than it was in 1895. There are different reasons for this, but lack of ore is not one of them. The Independence mine was held back on account of the new mill Mr. Stratton has put up on the ground. I was through it last Wednesday and everything is now in place with the exception of three pulleys which became lost or mislaid, and are being replaced. When these arrive the mill will be started up at once. Another setback for the total output came through the leasers. This year an unusually large number of leases expired, and as the mines were left in pretty bad shape, as a rule, it took the owners some time to clean them out. In spite of all these drawbacks, Cripple Creek may maintain last year's record or even beat it, if the mine owners or a few of the larger ones take a spurt in shipping."

The Independence mine, owned by W. S. Stratton, at Cripple Creek, has again been started up after a suspension of six weeks. The high-grade ore is being saved for shipment to the smelters and the low-grade ore is added to the already large dump, which is to be put through the new mill which will soon be put in operation.

There have been reported some strikes at Iris, twelve miles southeast from Gunnison, of large bodies of free-milling ore.

NEW MEXICO.

Silver City *Enterprise*: Forty-five men are employed at the Golden Giant mine and mill.

The Confidence mine is producing a regular quota of eighty tons of ore per day, which is reduced at the mill on the Whitewater.

ARIZONA.

Journal-Miner: In doing some development work on the Paragon claim in Hassayampa district, Robert J. Cartmell struck some black sulphide of silver which goes 91% in silver. The claim is located within a short distance of the celebrated Howard mine and is on a parallel ledge to it.

Nogales *Oasis*: M. Perrollaz, a gentleman who represents French capital, has recently closed a deal for the Cerro del Oro mine, in the Arizpe district, the purchase price, it is said, being 1,200,000 francs (about $240,000 gold). Late in the present month there will arrive, from France, M. Duchatnet, chief engineer, his assistant and the master mechanic to inaugurate the work of exploitation and erection of machinery. The mine is five days' journey from Nogales.

Arizona *Sentinel*: The New York company that purchased the Dr. Jayne group of mines at Picacho has had an estimate made of what it will cost to put the mines and mill into shape for crushing 125 tons of ore per day.

An English company has secured a group of twenty-one mines in the Picacho Basin, adjacent to the Goshen mine of the Dr. Jayne group, which they will open up when cool weather comes, and for the working of the ores of which they will put up a mill at the Colorado river.

Coast Industrial Notes.

—Sacramento, Cal., decided last Wednesday to issue $65,000 bonds for a new water system.

—Santa Clara, Cal., by order of court, is allowed to buy and operate a municipal electric light plant.

—A decrease is reported in the Los Angeles oil output, and an increase in that of Coalinga, Fresno Co.

—There are over 200 carts at work grading the new railroad between Sisson and the McCloud river.

—The stockholders in the Truckee ice palace are already making preparations for next winter's carnival.

—The Western beet-sugar factory, at Watsonville, started on a five-months' run last Wednesday, employing about 125 additional men.

—It is reported that F. Aug. Heinze, of Butte, has a party in the field making surveys for a railroad from Robson to Trail, in British Columbia.

—In addition to the usual number of halves, quarters and dimes, 750,000 standard silver dollars will be coined at the San Francisco mint this month.

—The S. F. & S. J. V. R. R. will decline to run through Fresno, Cal., unless the property owners of that city recede from their present demands for right of way.

—The Ocean Beach Oil Company has resumed operations at San Diego, Cal. They will put down two wells to a depth of 2000 feet. The first is down 1300 feet.

—The oil refinery built at Fresno by the Sunset Oil Co. is in operation. Its capacity is 1000 gallons per day. Tests show that the crude oil is 40 per cent kerosene.

—H. H. Morehouse is expected here shortly from Guatemala. He has a contract for a complete hydraulic and electric plant for the city of Antigua, to cost $70,000, and will buy it here.

—The steamship Monowai carried away last Wednesday for Australia 2200 tons of freight—the largest cargo she has taken. It consists of flour, canned goods, dried fruits, paper and machinery.

—Two Fresno men are going to put up a $10,000 mill there for seeding raisins. It will seed 40,000 pounds of raisins a day. The seeded fruit sells for three times the price of the ordinary raisins.

—One thousand bags of onions and an almost equal number of boxes of pears, for which there was no sale, were this week given away and dumped in the bay from the San Francisco water front.

—Last Monday about $50,000 was paid to the employes at the Vallejo Navy Yard for two weeks' work. The steam engineering department is building twelve small launch engines costing $575 each.

—The American River Land & Lumber Co. at Placerville, Cal., has leased its timber lands and lumbering plant to George Marsh, who has a contract for 5,000,000 feet of lumber per annum for five years.

—Truckee is building a little narrow-gauge road on the plan described in the last two issues of this paper. It runs but eight miles up into a hitherto inaccessible mountain chain, but is a starter. A road from Stockton to Calaveras Co. is also projected.

—At Nogales, Arizona, was last week incorporated the Calabasas Irrigation, Land and Water Co.; A. O. Brummell, M. R. Wise, R. Fley, D. F. Manlove; capital stock $3,000,000. The company proposes to irrigate 500,000 acres of land in the vicinity of Calabasas, Arizona.

—The California Beet Sugar Estate and Land Company, Limited, organized in this city last week. Directors—J. F. Gilmore of London, W. Easton, G. Easton, V. Neale, H. Francis, V. D. Duboce, A. H. Quatman; capital stock, $2,500,000, of which $2,485,000 has been subscribed by Director Gilmore.

—The Colusa Stone Company, which secured the contract for the stone work of the new Union depot, at the foot of Market street, San Francisco, now refuses to proceed until a final judgment of the State Supreme Court confirms their contract. Meanwhile the iron work goes on, and the Twentieth century will see the work of beginning the stone work well in hand.

—The Spokane and Leavenworth Coal Company has been incorporated at Spokane, Wash., capital stock $1,000,000; S. T. Arthur, P. E. Fisher, of Spokane, J. W. Arthur, F. A. Losecamp and J. F. Buttels, of Leavenworth. The coal field to be developed is located at Leavenworth, on the Great Northern Railroad. The company expects to be hoisting coal by September 1st.

—An English company has leased the Tehauntepec Isthmus Railway from the Mexican Government, agreeing to complete the work, improve the harbors at the Atlantic and Pacific termini of the road and put on a line of freight vessels between Salina Cruz—the Pacific coast terminus of the road—and this city. This is a matter of considerable importance to San Francisco, especially if the English company makes good its agreement to create suitable harbors at each end and remain an independent competitive line.

—The Government will not allow lumber to be shipped out of Alaska, but there are a number of mills in the field for the local trade. Most of the large canneries and mining companies own mills. The newest mill is that of LaDue & Harper, near Circle City, which, with the exception of one at Fort Cudaby, enjoys the honor of being farther north than any other sawmill in North America. Common lumber is worth from $60 to $100 at the mills. The most interesting mill is that of Rev. William Duncan at New Metlahkahtla, which is operated entirely by an Indian crew. The mill can cut about 25,000 feet per day for local purposes, and furnishes power for an electric-light system also operated by the natives.

—Dealers say that never before in the history of Oregon has the wool situation been anything like what it is at the present time. Heretofore there has always been a market for wool at some price. There has always been money in the past, plenty of it, to advance to any and all who wanted to consign their wool. People have held back for better prices in days gone by, but when the time came that they had to sell there were always buyers ready to pay the market price. Now there is no market, no price, no buyers—none who will make advances. The wool business is at a dead standstill. Mountains of wool, one of the mainstays of eastern Oregon, is tied up, and, for the present needs, is as worthless as the sands of the Columbia; 20,000,000 pounds of wool in eastern Oregon towns alone, and no one to even advance enough money on it to pay freight from one town to another. This wool is stored in warehouses at Huntington, Elgin, Baker City, Union, Durkee, Pendleton, Heppner, Echo, Arlington and The Dalles. Some of the producers of this wool will, however, give the usual eastern Oregon majority for "free trade and competition with wool the world over" next November.

Personal.

J. X. FERGUSON is the new superintendent of the Bonneville mine, Baker city, Or.

SUPT. BROWN, of the Poorman, Idaho, mine, has resigned to take a similar position in a New Zealand mine.

A. D. GASSOWAY, formerly superintendent at the Mayflower mine, is now superintendent of the Magalia, Butte Co., drift mine.

H. T. Power, president of the Placer Co., Cal., Miners' Association, has been nominated for the legislature by the Republicans of that district.

M. SCHIEFFELIN, one of the first discoverers of Tombstone, Arizona, district, is prospecting in Inyo Co., Cal. Ed Schieffelin is prospering in southern Oregon mining operations.

JOHN HAYES HAMMOND, No. 8 Old Jewry, London, has renewed his appointment as consulting engineer to the Consolidated Gold Fields Company of South Africa for a term of three years from July 1, '96.

COUNT G. DE KERGOLAY and Baron de Boutray of Paris, members of the French syndicate owning hydraulic mines at Junction City, are here on a personal inspection of the properties, which are described on page 138 of this issue.

H. H. WEBB, formerly of this city, has been appointed consulting engineer for the Chartered Company at Johannesburg, to take up the work of John Hays Hammond who will remain in London. Mr. Webb, who is a graduate of the School of Mines of the University of California and a nephew of Irving M. Scott of this city, left here last year for Buluwayo, South Africa, to take charge of some of the same company's mines there.

Commercial Paragraphs.

THIS paper is in receipt of a copy of an authentic and much-needed map of Mariposa county, compiled by W. G. Luckhardt, M. E., showing clearly the position of all the old patented mines, and also the new mines upon which work is now going on. It is for sale by Taylor & Ward, 71 and 73 Stevenson street, San Francisco; price $1.50, postpaid.

A FAC SIMILE, reduced in size, is received of the award to the Roessler & Hasslacher Chemical Co. of New York, issued by the World's Columbian Commission on the occasion of the Chicago Exposition, "for a well-arranged exhibit of cyanide of potassium for mining purposes, showing various forms of preparation and packing, according to the particular use for which it is intended: a valuable and instructive exhibit." The award is handsomely framed in quartered oak. This company received five other awards at the same time, one being for novelty and practicability of an important modification in the method of desilverizing argentiferous lead by zinc. The addition of a small quantity of aluminum to the zinc prevents the formation of zinc oxide in the skimmings, and the consequent loss of silver. The substitution of electrolysis for distillation in the treatment of the argentiferous zinc is also an important change.

Recent California Mining Incorporations.

Somers Gold Mining Co., S. F.; V. H. M. MacLymont, W. E. Waters, T. C. Gorris et al; capital stock $1,000,000, $600 subscribed.

Berry Creek G. M. Co.; H. H. Lee, W. B. Lee, J. D. Drake, F. C. Gehricke, J. C. Diamond; capital stock $1,000,000, all subscribed.

Oro Fino Mining Company, San Francisco; W. C. Fitzsimmons and F. H. Fitzsimmons, C. P. Bagg, H. Gage, C. J. Decker; capital stock $200,000, $15,000 subscribed.

Richland G. M. and M. Co., S. F.; I. R. Wilbur, J. Rosenthal, T. Fox, E. D. Farish, L. Shores; capital stock $500,000, $125 subscribed.

Queen of Sheba G. M. Co., S. F.; G. A. Helmore, O. C. Wilbur, W. F. Drake, J. McMullin, J. G. Boyne, H. C. Hurlbut, M. J. White; capital stock $1,000,000, $450,000 subscribed.

The Price-Eaton Company, S. F.; capital stock $500,000, $300,000 subscribed; W. C. Price, E. Scott, G. W. Baker, F. Avery, J. W. Pew.

The Grass Valley Gold Mining Company, Oakland, Cal.: A. W. Brodt, T. J. McFessel, W. H. McNaughlin, G. Schutz and H. J. Lewis; capital stock $1,000,000; $72,000 subscribed.

"HERCULES" MINING HOISTS.

In ordering a new 10-horse power Hoist the Texas Consolidated Gold Mining Company wrote: "We hope your 10-horse power outfit will be as good in proportion as the 4-horse power we now have; the latter can't be beat. We hoist 700 pounds 150 feet out of a perpendicular shaft, 30 to 35 tons in ten hours." The same company wrote later:

Please permit us to express our entire satisfaction with the 10-horse power Hercules Gasoline Engine and Hoist purchased from you last August. We have worked it for the last three months and find it to do excellent work; likewise the 4-horse power Gasoline Engine purchased some time ago, which is now being used for the lighter work. Yours very truly, TEXAS CON. GOLD MINING CO.

The Manhattan Mining Company now uses three of our Gasoline Engines for pumping on the lower levels at a cost of $9 per day for fuel and labor, as opposed to $36 per day for doing the same work by steam.

The Amalie Mining Company bought a 3-horse power "Baby Hoist" as an experiment, and within six weeks ordered another 6-horse outfit.

The HERCULES GASOLINE ENGINE AND HOIST is the most simple, compact and economical in the market—occupies less space and does more work for less money than any other Hoist.

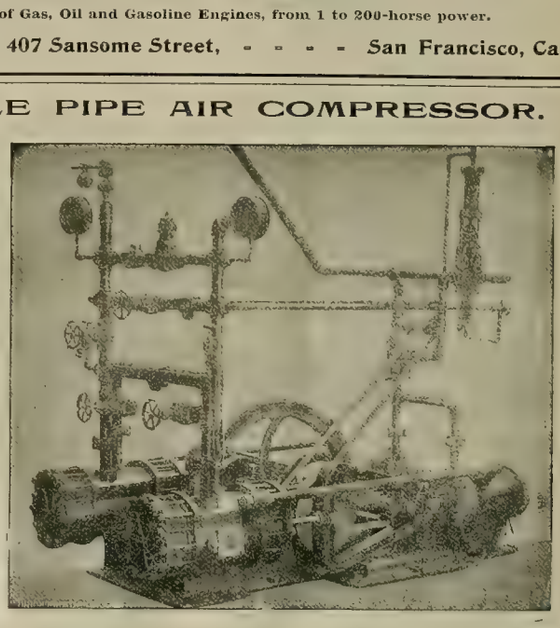
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

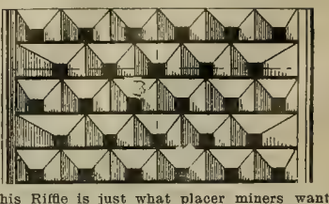
PAYNE'S

PATENTED

GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

1710 Champa Street, DENVER, COLORADO.

☞Woul sell an interest to right party.

REMOVAL NOTICE!

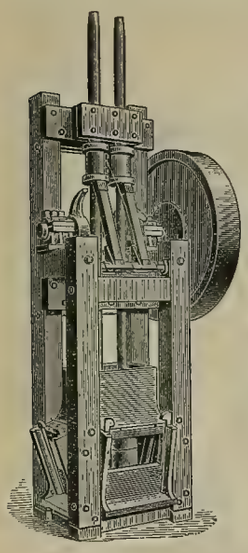
MINING AND MILLING MACHINERY.



"HENDY" IMPROVED
TRIPLE-DISCHARGE
Two Stamp Mills.

Superior to all other Mills of the same form for the following reasons:

First. Because **Two Stamps** will do **More and Better Work** in a mortar than any other number, as the motion of the stamps causes a discharge at the ends of the mortar, in addition to the front discharge, thereby increasing the stamping capacity, and leaving the pulp of uniform fineness.
Second. They are the cheapest mills to the stamp that were ever offered to miners.
Third. They do not slime the ores or flour the quicksilver, as the lateral motion of the pulp prevents such effect.
Fourth. They crush all kinds of ore, rock, cement or conglomerate perfectly.
Fifth. They are more durable, as the framework is secured to the mortar and thoroughly bolted together.
Sixth. The several parts are interchangeable and can be readily set up or taken down and duplicated.
Seventh. No skilled labor is required to assemble the parts.
Eighth. The discharge is larger in quantity to the stamp, and the number of drops per minute, (110) of the stamp is greater than any other mill.

Weight of Stamps (each) .....850 pounds.
Weight of Mill complete.....7500 "
Power required to drive.....5 H. P.

CAPACITY, SIX TO TEN TONS PER DAY.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

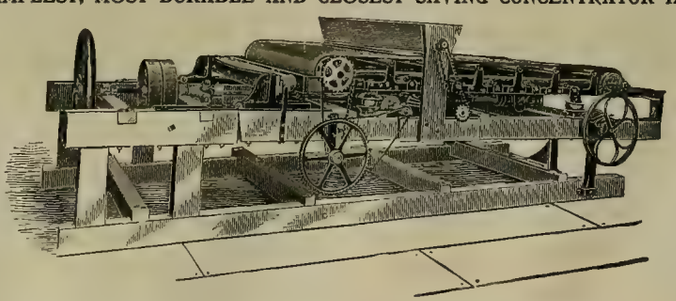
NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 13, 1896.

There is a continued good demand for all kinds of goods and mining machinery from the gold mining districts on this coast. From other sections the call for goods is of a hand-to-mouth character. It is stated that while the Presidential election attracts attention still it does not interfere with general trade the extent it has heretofore done. This, no doubt, is due to the small stocks of goods carried by the retail trade compelling steady assortment buying. The close money market in this city is also against extending much credit. Why the banks are pursuing the course they do it is hard to find out, for they are most certainly creating an uneasy and feverish feeling which may operate against them. With manufactures, particularly iron workers, there is a continued good. confidential feeling. The demand for mining machinery not only holds up well but an improvement is looked for this fall and next spring.

The local money market seems to be working closer, with banks discriminating against paper currency that has to be sent East for redemption. They charge a small discount, just enough to cover exchange. Singular as it may appear, there is a light call for remittance to the East, which is largely met by commercial bills drawn against produce shipments. It is also said that banks are drawing as much of their funds from the East as they can spare. This is also against Eastern exchanges. At the East the money markets have been more or less feverish and irregular. At New York interest on call loans have advanced and declined the same day, causing all kinds of speculative securities to move down or up, according to the supply of money. The European money markets are generally easy, having recovered from the eastern European complication scare. Gold has increased in supply, but silver has decreased.

MONETARY SYSTEM OF THE UNITED STATES.

In view of the large interest taken in the money question of this country the following compilation from official sources is of peculiar interest:

Gold Coin.—Weight, 25.8 grains to the dollar; has fineness of .900; no limit to issue; denominations, $20, $10, $5 and $2.50; has an unlimited legal tender quality; is receivable for all dues; is changeable for certificates under certain limitations.

Gold Certificates.—Issue suspended so long as free gold in Treasury is below $100,000,000; denominations, $10,000, $5000, $1000, $500, $100, $50; no legal tender quality; receivable for all public dues; exchangeable at Treasury for gold coin or any other money; redeemable in gold coin at Treasury.

Silver Dollars.—Weight, 412.5 grains to the dollar; ratio to gold, 15.988 to 1; issue limited to requirements to redeem Treasury notes; denomination, $1; unlimited legal tender quality unless otherwise contracted; receivable for all dues; exchangeable for silver certificates or smaller coins at Treasury; may be deposited for silver certificates.

Silver Certificates.—Issue limited to silver dollars in use; denominations $1,000, $500, $100, $50, $20, $10, $2, $1; has no legal tender quality; receivable for all public dues; exchangeable for dollars or smaller coins; redeemable in silver dollars.

United States Notes.—Issue $346,681,016 and in same denominations as silver certificates; legal-tender quality is the same as silver dollars; receivable for all dues (duties on imports by regulation only); exchangeable for all kinds of money except gold certificates; redeemable in coin at sub-treasury in New York and San Francisco in sums of $50 or over.

Treasury Notes of 1890.—Total issue $156,044,615 and in the same denominations as silver certificates; legal tender quality is the same as silver dollars; receivable for all dues; exchangeable for United States notes; redeemable in coin at Treasury and when so redeemed are cancelled and retired.

Currency Certificates.—Issued in $10,000 denomination; has no legal tender quality; exchangable for U. S. notes; redeemable in U. S. notes at sub-treasury where issued.

National Bank Notes.—Issue limited to volume of U. S. bonds and their cost and in the following denominations: $1000, $500, $100, $50, $10, $5; has no legal-tender quality; receivable for all dues, except duties and interest on public debt; exchangeable for silver and minor coin; redeemable in lawful money at Treasury or bank of issue.

Subsidiary Coins.—Weight, 385.8 grains to the dollar; ratio to gold, 14.953 to 1; issue limited to needs of the country and in denominations of 50 cents, 25 cents and 10 cents; legal-tender not to exceed $10; exchangeable for minor coins; redeemable in lawful money at Treasury in sums of $20 or any multiple.

Minor Coins.—Silver 5-cent piece, 77.16 grain; nickel 5-cent piece, 75 per cent copper and 25 per cent nickel; silver 1-cent pieces, 48 grains; copper 1-cent, 95 per cent copper, 5 per cent tin and zinc; issue limited to needs of country; legal-tender quality not to exceed 25 cents; redeemable in lawful money at Treasury in sums of $20 or over.

New York Silver Prices.

NEW YORK, Aug. 13.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	31 5-16	68½
Saturday	31¼	68⅜
Monday	31¼	68¼
Tuesday	31 3-16	68
Wednesday	31⅛	67⅞
Thursday	31⅛	67⅞

	Copper.	Lead.	Iron.	Tin
Friday	11 00	2 70	10 25@12 50	13 30
Saturday	11 00	2 75	10 25@12 50	13 30
Monday	11 00	2 75	10 25@12 50	13 30
Tuesday	11 00	2 75	10 25@12 50	13 35
Wednesday	11 00	2 75	10 25@12 50	13 35

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	.5
New York Telegraphic Transfer	.7½
London Bankers' 60 days	$4.83
London Merchants	$4.86½
London Sight Bankers	$4.89½
Refined Silver, per oz., 1000 fine	68½
Mexican Dollars	53¼@54½c

All exchanges are nominal.

SILVER.—The market has been slowly declining. This is contrary to what had been expected and in the face of the miners' strike at Leadville reducing the output in this country. The demand is slow for export both on this coast and at the East while the speculative call seems to have largely died out. The steamer Belgic for the Orient took out $170,871 in bullion. The exports from this port during the first seven months of this year aggregate $3,437,000. During the first seven months of the year, silver shipments from London to Africa, India and the Straits were £3,005,523, against £3,795,500 during the same time in 1895. India has taken £1,913,578 this year, a decrease of £280,000. China has taken £574,413, or only a little over one-half of the amount taken in 1895. The shipments to the Straits are about the same as last year.

MEXICAN DOLLARS.—The market is quiet, with quotations largely nominal, ranging from 63¾c to 64¼c, according to quantity and quality. The steamer Belgic took out 61,414 dollars to China.

COPPER.—The market has held fairly firm both on this coast and at the East. The strength is largely due to advices from Europe to the effect that the visible supply of copper on August 1st was 34,180 tons, against 36,300 tons July 1st and 36,910 tons June 1st, while the deliveries were 19,500 tons in July, 15,400 tons in June and 17,800 tons in May.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is quoted lower. The domestic demand is slack, but there is a continued good export movement to the west coast of Mexico.

Domestic trade, per flask	36 00

For export quotations are nominal, but less than for home.

ANTIMONY.—The demand is fair, with the market steady at 7¾@8¼c in a jobbing way. New York mail advices quote 7¾@7¼c for Cookson's, 6¾c for Hallett's and 6¼c for Japanese, from store.

LEAD.—The market is lower and weak at the decline, both here and at the East.

Pig	3 65	@	—
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—There is very little business passing. The decline in silver is against the market. For plates the market is flat, both here and at the East.

Pig, per lb	14¼
Plate, I C coke, heavy, per box	$4 10@ —
" " " light, "	4 00@ —

BORAX.—The market is quoted as follows

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	6¼
Concentrated, "	5⅝

POWDER.—There is a continued good demand for mining purposes.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON.—There is a fair consumptive demand. The market favors buyers. The East reports a slow market, with production curtailed.

COAL.—Imports and consumptive demand are about the same. So far as we are to learn quotations are unchanged. The bark Theobald has arrived from Cook's Inlet with a cargo of Alaska coal. It is of much better grade than that heretofore brought and consequently it finds a ready market.

Mining Share Market.

SAN FRANCISCO, Aug. 13, 1896.

Trading has been quite light, with even cross-orders not so much in evidence. The latter were only used to keep prices down, so the manipulators could buy the few shares thrown out by disgusted holders. It would seem as if the depression of the market and poor official advices from the mines have been done largely to keep outsiders from buying and also kill time until more assessments could be levied, by which holders of shares can be squeezed still more. Reports are current that quite a line of assessments are to be levied, even including Con. Virginia. That they will prove correct in the course of time can not be gainsaid, but how soon it is impossible for the writer to say. They may come on when prices are about bottom, and then again they may be put on when the market is nearing top, for that there is a small deal on hand is among the certainties, but how soon it will start is among the uncertainties. There have been and still are strong buyers in the market, who have been taking all the shares possible at the declining prices of the past four weeks. Of necessity, they made small rallies, so as to buy at the advance as well as on the decline. Under these purchases, shares in some of the mines have been well concentrated, but it remains to be seen what success will be met by the manipulators when they attempt to unload at higher prices. The money market is said to be against a deal, owing to banks not being of an accommodating turn of mind, while it is claimed in well-informed circles that inside managers of the mines are not prepared, and will not be for some time to come, to show up much ore, and without a good-sized showing moneyed outsiders will be slow to take hold. While saying this, the action of the market indicates that an attempt will be made to advance the shares of one or two of the mines, in which movement the entire list will sympathize, and their leader, it is quite safe to assert, will probably not be that in the last little deal, when Chollar went from 35 cents to $4.30. This opinion is not based on information, but on the workings of all former small deals, and also to the fact that the news from Chollar is most too good at current prices.

From the Comstock mines our advices, taken as a whole, are of quite a favorable character, yet ore can be found and covered, work stopped or else turned in the wrong direction and outside shareholders be made to suffer. In the Alta winze on the Keystone vein they were in fair grade ore according to the official letter. In the other Devil Gate mines no work, so far as the public know, is being done. From the Gold Hill mines our advices are to the effect that no work is being done in Caledonia. In Overman they are raising a few tons of ore. It is reported that there was a strike of ore a short time ago in this mine, but the information has been kept back. Seg. Belcher and Belcher are still raising fair grade ore each week, but not enough to pay current expenses. In Crown Point they are still taking out ore from the 1100-foot level for testing. One run of a 110 tons only gave battery assays of $5.90 per ton, gold. Unless the remainder of the ore for testing proves richer this deposit will not pay to extract and mill. Exploiting work is underway in the 650-foot level. From Kentuck and Yellow Jacket no advices are at hand. The air connection in Confidence has admitted of a resumption of ore extracting but, as yet the quantity is small and grade fair—only assaying a little over $20 a ton. It is not at all impossible that more active exploiting work will be inaugurated before long in both Confidence and Challenge. In Con. Imperial the long west crossdrift is out now 640 feet. Fair progress is also being made in west crossdrift No. 3. In Alpha and Bullion no change in the working is reported in official letters. From the middle mines our advices are to the effect that in Potosi on the 450-foot level they continue to encounter stringers and beams of ore. The formation, taken as a whole, is said to be favorable. In Chollar they were at last official advices in 3 feet of fair ore at two places in the mine. They extracted the past week 102 tons of fair grade ore which is being stored for milling. In Hale & Norcross they are working on the 900-foot level and also following a small streak of high grade ore. A few tons from this was extracted which assayed over 62½ ounces in silver to the ton. In Savage work is continued on several levels. On the 950-foot level work is to the Hale & Norcross line. In the northend mines work in both Gould & Curry and Best & Belcher is to the east from the Bonner shaft level. In Con. Virginia we are not advised of any material change in the situation. It is said that the water has risen to within a few feet of the 1750-foot level, but as the ore they are extracting is above the Comstock tunnel level no danger from this source is expected, the only danger is that the ore will run out. Good progress is being made in getting the old bonanza excavation in good condition so there will be no trouble in the future from fire and gas. In Ophir fair progress is being made in the Central tunnel and 1000-foot levels. While the formation is said to be favorable the ore only assays from 50 cents to $2 a ton. Work is continued in the 1000-foot level of Mexican towards the west. No change is reported in official letters. From the Union and also Sierra Nevada shaft they continue work on the north drift from the raise 190 feet above the sill floor of the 900-foot level. They are also driving an east crossdrift. In Sierra Nevada work is continued in the Layton tunnel level. In Utah they are driving a west crossdrift from the mouth of the south drift. They are still at work in Andes in the 450-foot level. Formation is unchanged.

From the Brunswick lode, while our advices continue encouraging, yet they are not of a character to excite the cupidity of outside operators. If what has so far been found in that lode had been found in the Comstock lode it would not have excited much attention, but it is the chance of finding a large body of ore in the former that keeps interest alive. The lode is comparatively an unknown quantity, and therefore the ore already found is said to be sufficient to cause men with money to gamble on its yet being something big, or else a failure when compared with the Comstock. In Chollar they are still pushing south on the 300-foot level, and run into and out of the ore every two or three days, which causes the shares to advance and then decline. So far there has been a decided improvement in the 300-foot level over the 200-foot level. In Hale & Norcross they are driving the north drift towards the Savage line, and also sinking the winze to the 400-foot level. The latter they will reach and commence drifting south by the latter part of this month. Mining men look for a decided improvement in this level over the 300-foot level. In Savage there is no change in the work. In Gould & Curry there is active exploiting work. The joint winze being sunk by Con. Virginia and Best & Belcher will be soon deep enough to open out a level for exploiting. The winze in Occidental below the 750-foot level was, at last advices, in 2 feet of $50 ore. Exploiting work is being done on the other levels.

From the Bodie district our advices are to the effect that active work is being done on the 200-foot and 300-foot levels. On the 450-foot level of this mine Mono is working to the Mono line so as to strike the Fortuna vein in the latter mine where it has not been worked before. In Bulwer the more active work is being done in several levels. They extracted thirteen tons of ore assaying $66 to the ton. In Bodie they are placing the electrical machinery to replace that burnt some time ago. This machinery is used for hoisting and pumping purposes.

In Silver King, Arizona, in the raise to connect with the winze they struck 2 feet of milling ore.

The market was dull and heavy to-day with some outside selling which caused a slight demand in all the shares except Chollar and Hale & Norcross. Everything that can is being done to squeeze outsiders out of their holdings before an upmove gets in. Con. Virginia, it is said, will not be assessed as the company has $8500 cash in hand and will have by the end of the month 1000 tons of ore to be milled which assays about $100 to the ton. Crosscutting will be commenced soon on the 1650-foot level. From the Chollar's Brunswick working advices received to-day state that the south drift on the 300-foot level is looking well and no crosscutting will be done so long as the ore continues as they go south. The drift is out 145 feet from the north line. This is a most excellent showing. The ore in the Occidental winze has widened to 2½ feet and is of better formation.

The following illustrates the changes of the week:

ANNUAL MEETINGS.

Company and Location.	Secretary and Office in S. F.	Date.
North Pacific Mining & Transportation Co.	E D Farish, 632 Market	Aug 17

The Jno. G. Morgan Brokerage Company,

BANKERS and BROKERS,

1015 Seventeenth St., Cooper Blk.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

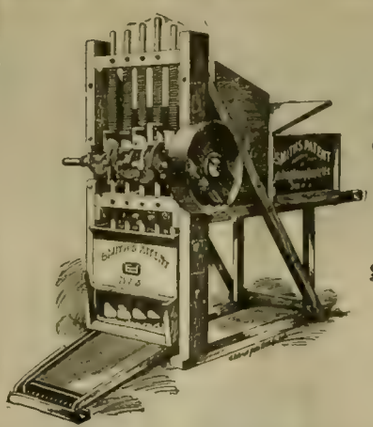
An Ex-Supt. and Mining Engineer,

Lately returned to California, desires a situation. Best of references. Address No. 37, this office.

SITUATION WANTED

By an experienced Amalgamator and Mill Man who thoroughly understands his business. References furnished. Address W. A., this office.

Smith's Improved STRIKING STAMP MILL.



Your Attention Is Called To the Fact

THAT SMITH'S LATEST IMPROVED CALIFORNIA TUBULAR STAMP STRIKING QUARTZ MILL

Is easy to handle, and its cheapness of operation, combined with the low price of the Mill and the ease with which it can be moved from place to place, gives it greater and more perfect results than all others of its kind. We use the best **imported** material that can be had, and guarantee all parts of the Mill for six months. Two sets of Power Striking Steel Springs are furnished with each Mill. This is the Greatest Gold and Silver Mine Opener and Developer now on the market, and can be had complete and ready to operate at the low price of **$250.00.** It is the poor miner's chance to obtain the best Mill made with all the latest improvements. Water tanks ore feeders, silver plates, and everything necessary ready to attach power. Seventy five Mills are now in actual operation. **SEND FOR ONE AND TRY IT.** Also send us your friends' address and we will send free of charge our Mill Catalogue and Price List, together with other information desired.

$250.00 Will Buy a Complete SMITH MILL.

Greatest mine opener of the age.

Can be taken into the remotest regions at a trifling cost.

The poor miner's surest friend.

The most durable Mill on the market.

The cheapest Quartz Mill on earth.

Address ALPHONSO B. SMITH,
BOX 1,
228 W. FOURTH STREET. ....LOS ANGELES, CAL.

This Mill strikes 250 blows per min. and crushes 2½ tons in 12 hrs. The only Combined Hand Power or Motor Power Mill on Earth.

25,858.—DESIGN FOR INHALER—C. W. McKee, Phœnix, A. T.

25,852.—DESIGN FOR SPOON—A. F. Shriver, Newcastle, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

KEY OPENING CAN.—Wm. Henry Gilbert, Oakland, Cal. No. 565,162. Dated Aug. 4, 1896. This invention relates to that class of key-opening cans in which a wire is folded within a portion of the can or its cover and has one end projecting adapted to be grasped or taken hold of and caused to tear the fold in which it lies. The object of the invention is to provide a key-opening can of a simple construction, providing for the effective disposition of the opening or tearing wire and especially providing by the peculiar bending or construction of the flange for leaving the edge of the can throughout its entire circumference folded upon itself, and with a finished edge after the wire has been torn out, thereby adapting the can for other uses, such as a pail, a cup or such like vessel, requiring a finished and smooth edge. The device consists of a can, the end of the body of which is provided or formed with an exterior V-shaped flange or trough, and a wire lying in the base fold of said flange or trough with its end projecting so that when force is applied to it, the wire will tear through said base fold and thus sever the outer wall of the flange or trough and relieve the attached head or cover so that it may be separated from the body of the can.

POTATO DIGGER AND SEPARATOR.—Thomas E. Sadler, Reno, Nev. No. 565,181. Dated Aug. 4, 1896. This device relates to the class of machines for digging potatoes and separating the earth therefrom whereby they are left clean. The device consists generally in a peculiar shovel having grating wings on each side, and in connection therewith of a peculiarly mounted and operating separator grater. These parts, namely, the shovel wings and the separator grater have a reciprocating or vibrating movement by which the separation of the dirt from the potatoes is effected.

Obituary.

PROF. A. D. CHURCHILL died of sunstroke in Chicago last Wednesday. He was a geologist of considerable reputation and a prominent mining expert in Helena, Montana.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.
Operator and Dealer in
Mines, Mining Properties and Mineral Lands,
Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES.

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Walter Shackleford, in the Jack's Ranch Mine, near Meadow Valley, Plumas Co., to deposit tailings in an old pit; from J. F. Cowdery, in the Sacket's Gulch Claim, near St. Louis, Sierra Co., to deposit tailings in a ravine; and from Cadematori & Pelrano, in the Barnhardt Mine, near San Andreas, Calaveras Co., to deposit tailings in Grub Gulch, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on August 24th, 1896, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from George Beattie, in the Beattie and Parsons Mines, near Georgetown, El Dorado Co., to deposit tailings in Big Canyon Creek, and from Richard Phelan, in the Hilda Mine, near Sierra City, Sierra Co., to deposit tailings in a ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on August 31st, 1896, at 1:30 P. M.

ANNUAL MEETING—The regular Annual Meeting of the stockholders of the North Pacific Mining and Transportation Company will be held at the office of the Company room 5, No. 632 Market St., San Francisco, California, on Monday, the seventeenth (17th) day of August, 1896, at the hour of 1 o'clock p. m., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Wednesday, August 12th, at 3 o'clock p. m.

E. D. FARISH, Secretary.

Office—Room 5, No. 632 Market street, San Francisco, California.

Assessment Notices.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of July, 1896, an assessment (No. 4) of Two cents (2c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of August, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 21st day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, Room 38, Crocker Building, San Francisco, alifornia.

CONSOLIDATED IMPERIAL MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 24th day of July, 1896, an assessment (No. 37) of One (1c) Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 35, third floor Mills Building, corner of Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of August, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 22d day of September, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, Third Floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

BELCHER SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of August, 1896, an assessment (No. 53) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 37, third floor, Mills Building, N. E. corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 30th day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. PERKINS, Secretary.

Office—Room 37, third floor, Mills Building, N. E. corner Bush and Montgomery streets, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors o the Jamison Mining Company, held on the 22nd day of July, 1896, it was resolved that any stock upon which the assessment shall remain unpaid on the seventh day of September, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, September 28th, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

NEWSPAPER WANTED.

An experienced publisher, (who is a practical printer), desires to lease a newspaper or to take a situation, temporarily, with a view to purchasing an interest in or the entire business. Mining county preferred. Address "H. S. S.," care of Mining and Scientific Press, San Francisco.

FOR SALE!

A Large and Well-Equipped Gravel Mine.

This is a regular producer, netting from $1500 to $3000 per month. Reasons for selling will be explained to a bona-fide purchaser. Address, **GOLD MINE, P. O. Box 66, Placerville.**

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

FOR SALE.

4,000 Feet 3-in. 4-in. and 6-in. Pipe, suitable for mines, irrigation, or village water works system. W. F. THOMPSON, 40 Main Street, S. F.

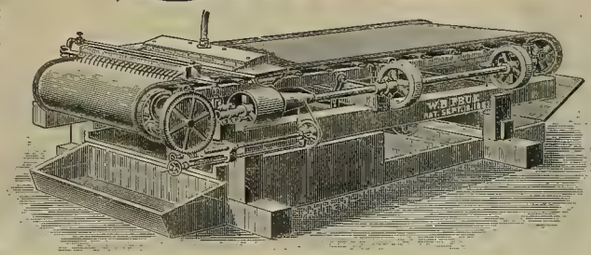
FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

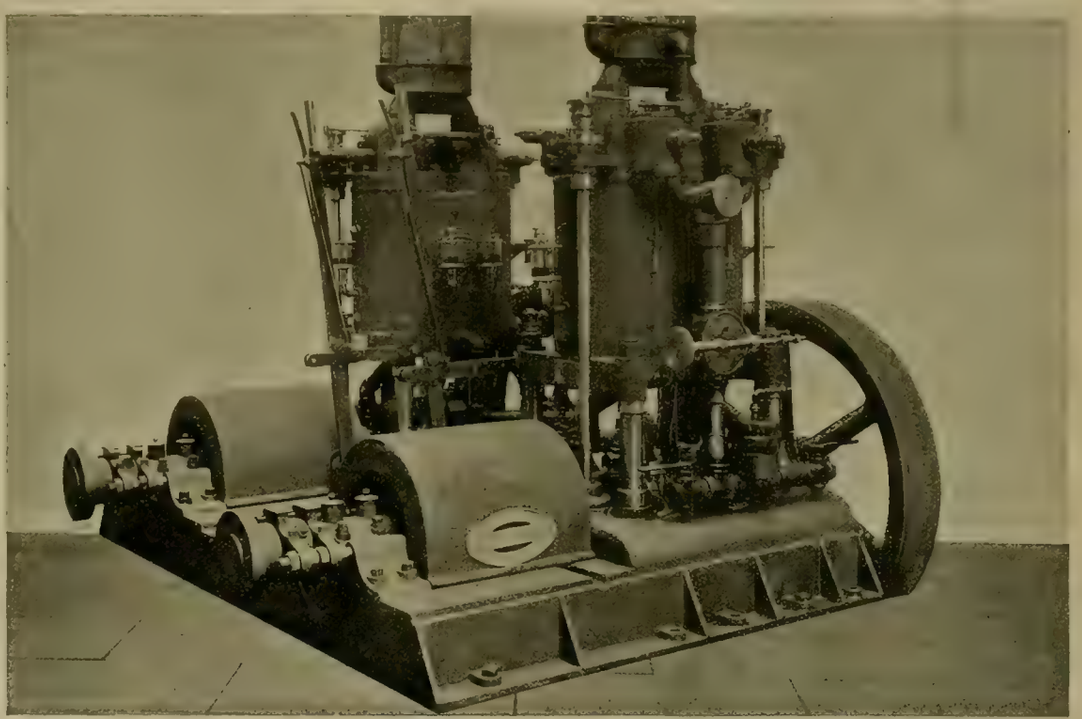
AND PACIFIC ELECTRICAL REVIEW.

No. 1885.—VOLUME LXXIII. Number 8. SAN FRANCISCO, SATURDAY, AUGUST 22, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Twin-Screw Gasoline Marine Engines.

The accompanying cut shows a pair of duplex 40 H. P. "Union" engines, for driving a twin-screw passenger boat on the Columbia river, built by the Union Gas Engine Company of San Francisco. This company has been building gasoline engines for many years, and has constructed some of the largest marine engines in the world, but the engines here shown are the first built of this type. These engines were built to fill the second order received from the Ilwaco Railway and Navigation Co., the first order being for a 20 H. P., which has been in use for the past three years.

It is a notable fact that the first successful cable passenger railways were built in San Francisco, and the first successful gasoline marine engines were also invented here, which speaks well for our engineering ability. The gasoline engine, as built by the Union Gas Engine Co., is not only a handsome and durable machine, but its simple and accurate governing device, and other mechanical details, show a very high degree of mechanical engineering skill.



DUPLEX "UNION" MARINE ENGINES.

QUICKSILVER receipts at San Francisco for the first six months of '96 aggregated 15,706 flasks of 76½ pounds each, the largest for any six months since '86. The exports by sea for the corresponding period were 8,549 flasks, worth $313,367; by rail during the same period went 6,162.

FROM many quarters comes news of suspension and curtailment of various forms of business "till after election." No such stagnation exists in any business directly or indirectly connected with gold mining. The utmost activity prevails, with promise of continuance.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Duplex "Union" Marine Engines; The Latest Improvements in Electrical Development—300 H. P. Motor; One of the Motors in the Station; Secondary of Motor; The Cast-Iron Frame; The Switchboard; 100-Light Brush Machine, 149. A New Fly Wheel, 153.

EDITORIAL.—Twin-Screw Gasoline Marine Engines, 149. Great Investment of Capital in the Bicycle Business; Raising Auriferous Gravels; Foreign Capital in California; County Mineral Exhibits; Mining Blunders; The Geological Survey and Mining, 150.

MECHANICAL PROGRESS.—A New Construction for Fly Wheel; Cause of Pitting and Corrosion, 153.

SCIENTIFIC PROGRESS.—Change in the Manufacturing Industry; To Prevent the Chemical Action of Acids, 153. A New Magnet, 154.

ELECTRICAL PROGRESS.—Latest Development in Electric Motors; Electrical Conductivity of Aluminum; Wonders of the X-Ray, 154.

PRACTICAL INFORMATION.—Tempering Steel: Different Kinds of Engines, 154.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 158-9.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 166.

MISCELLANEOUS.—Concentrates, 151. Vein Walls; The Accumulation of Amalgam on Copper Plates, 152. Silver and Gold Holdings; Coinage of Silver During 1895; Recent California Mining Incorporations; Commercial Paragraphs, 154. California Mines and Miners; Notices of Recent Patents, 155. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Obituary, 160.

EASTERN manufacturers say that the great investment of capital in the bicycle business is one of the causes of present industrial depression. In the region tributary to Chicago it is estimated that other business lines have lost $112,000,000 by such diversion of trade. Factories formerly devoted to other forms of machinery have changed to wheel manufacture, and purchasers of the potent cycle withhold expenditure in other directions. The cessation of trade in other directions caused by the universal use of the bicycle shows that it to-day exercises a commerical influence second to none in the industrial world.

EXPERIMENTS are being made with dredgers for raising the auriferous gravels from the beds of the Fraser and Quesnelle rivers in British Columbia. People of means are interested, and if the present trials are successful it is expected that considerable will be done in that way. For a number of years dredgers have been used for the same purpose in Georgia with some success, and lately one has been put to work on the fine sandy gravel in the bed of the Little Snake river in Colorado. The dredgers on the Fraser, three in number, cost from $20,000 to $40,000 each, but at last reports would require alterations to give satisfactory results. So far in California the results of dredger work have been uniformly satisfactory. It is a form of mining that requires considerable capital, judgment and careful management to be profitable.

FOREIGN CAPITAL is paying more present attention to California mines. Representatives of Eastern and European capitalists—English, French and German—are coming and going and are taking hold of properties. The French capitalists of Trinity county were the first to make large investments. Others are in Placer county opening up placer drift mines. The Exploration Company of London, backed by the Rothschilds and at the head of which is Hamilton Smith, formerly of the North Bloomfield, has taken hold of the Oneida and has had a number of other properties examined. Edmund Davis, a director of the Anglo-Continental Gold Syndicate of London, has been here some time looking for investments. John Hays Hammond is directing a search for mines in California for the capitalists interested in the Chartered Company. These are but a few of the representatives of big European and Eastern capital who are looking for mines in California, and yet all this interest has come up without any concerted effort on the part of Californians to attract attention. No mining field in the world of such extent has been so little self-advertised as California. This is where Coloradans are ahead of us. They know the value of letting the world know what they have and are not slow in doing it.

County Mineral Exhibits.

One result of the late exposition of Alameda products in Oakland is the establishment of a permanent exhibit similar to that of the State Board of Trade. There are in other parts of the State permanent county agricultural displays. It would be a good plan for the mining counties to emulate these examples. An exhibit at the county seat of each mining county of the minerals produced, with samples from the vein, walls and country rock, showing the formations, maps, geologic as well as topographic, and statistics as to water, timber and other matters of interest to miners, would be of great advantage. Experts and others examining mines in any part of the State are often—in fact, nearly always—handicapped by want of sources of information that should be matter of public record. This is especially true as to maps of the topography of the country and as to the geology. That this is appreciated is shown by the fact that many saloons in the mining towns take advantage of it to turn an honest penny by keeping on hand a cabinet in which are specimens from mines of the district, and not only specimens of the ore, but samples from the walls and country rock, as well as maps. These collections are made not so much for display as for the information of the patrons of the place.

Of course, it would not be necessary or advisable to maintain any elaborate collection, nor one for display to attract the attention or admiration of the casual visitor who knows nothing of mines. No attempt need be made to emulate the admirable work of the State Mining Bureau in this city, which in itself serves as the best argument we can offer in favor of county exhibits.

Exhibits of the character suggested should not cost very much. Space sufficient can be allotted in the county building of each county. Most of the maps necessary could be obtained gratis, and the mine owners would with little solicitation supply the minerals for a creditable start.

The California miner is not a good advertiser, nor is he inclined to ask help from others, but in a case of this kind it seems that it would be to the interest of any one having the welfare of his county at heart to take action for the common good.

Mining Blunders.

According to Professor Ashburner, there were in 1858 over 280 quartz mills in California with 2610 stamps and the total cost of the milling property exceeded $3,000,000. In 1861, while he was attached to the Geological Survey, he made a careful examination of these mills and could find only between 50 and 60 in successful operation. Commenting upon this, the late J. Ross Browne, in his "Mineral Resources of the Pacific States and Territories," published in 1868, gives some of the reasons for these failures, which will apply in a minor degree at the present time. He said: "The greatest common blunder has been that of erecting a mill before the vein was well opened and its capacity to yield a large supply of good rock established. * * * The next blunder was that the difference between a pocket vein and a charge vein was not understood, and the existence of rich specimens was considered proof of a high value of a mine. * * * The next error was that nothing was known of pay chimneys, and if good quartz was found in one place, it was presumed that the whole mine was of the same quality. * * * Much rock has been crushed without examination and without proper selection. * * * Sinking was done often when nothing was found at the surface. * * * It has not been customary to make assays regularly of the tailings, so as to know what was passing off. The mine owners in a large proportion of cases have not resided at the mines and have not made a study of the business."

It is no wonder then that mining was considered little better than gambling and that conservative business men refused to go into it. One indication of great improvement in methods, and a consequent better reputation to the business, is the fact that so many down-town merchants, bankers and others, who a few years ago would refuse to listen to any mining proposition, are now most active in looking for good mining investments, knowing that mining properly conducted is as safe a business as any mercantile business. But there are miners in California yet who would do well to heed the warnings of Ross Browne.

The Geological Survey and Mining.

It is pleasing to note that the United States Geological Survey has at last relinquished its position as scientific coroner to our great country and ceased to employ its time and means in post-mortem examinations, for not only have our federal scientists delighted in voluminous reports upon fossils, but they have until recently exhibited a remarkable reluctance to study a mining district until it had been practically worked out or abandoned. No one can doubt the scientific value of the reports upon the Comstock lode and many others, but every competent mining engineer knows how little practical value they have been.

The geology and mineralogy of one district, except in points of common knowledge among mining men, has but little application to any other district; but a thorough knowledge of the mineralogy and geology of a district, especially in our interior States, is often of great value to operators and good, timely reports of greater value to investors. The time when work is needed is in the early days of a mining camp, and not after it is fully understood by the miners and the public. It is no indication of scientific ability to go into a well-developed or practically exhausted district and collect the fragmentary records and researches of competent men, clothe them with a new vocabulary and evolve a voluminous monograph. Yet by this method too much of our knowledge of mining geology has been accumulated.

What is demanded by the practical investor, engineer or miner is a thoroughly comprehensive report upon existing facts and conditions of geology. Volumes of hypotheses are valuable, but when the facts are so interwoven with these hypotheses as to make their differentiation impossible, the report loses a large part of its value to competent men who are able to decide for themselves the legitimacy of conclusions.

During the past two or three years the change of policy on the part of the Survey has been a matter of gratification. No one wishes the scientific side of the science overlooked, for its advance is of greatest importance; but in the meantime some changes in methods would place in immediate practical use some of the accumulated knowledge.

The timely report upon Cripple Creek district is a marked advance, although by slight effort it might have been before the public six months sooner. Good work has also been done on the Mercur district. The field work in the Nevada City and Grass Valley district was finished in the winter of 1894, but is not yet in evidence. The Cripple Creek report is of great value to conservative men, and, should the demands of the future warrant it, it can be elaborated with the further development of the mines.

Meantime Butte, Montana; Bisbee, Tombstone and Pierce, Arizona; Carlisle, Pinos Altos and Mogollon, New Mexico; Kern and other counties in southern California; Baker City, Oregon, together with the gravels of Idaho, Wyoming and northwestern Colorado, present problems that might be solved with great value by the United States Geological Survey. It will be argued that such work can not be accomplished in a short time and without considerable expenditure of money. But it is to be remembered that competent men are not limited to the corps of the survey, and that reports like that of the Cripple Creek district involve but a few months time and a small expenditure. The Survey now complains of lack of sufficient appropriation, but it is well known that of that part devoted to mining a large proportion is expended in topographic and geologic mapping of such areas as our high Sierras, where the cost of mapping is as great as the value of the land, and where no mines have been developed. The geologic atlas has proved itself a valuable feature, but until the areas of some economic consequence have all been mapped, the work might as well be confined to such localities.

The Geological Survey has never, and probably never will, develop new mineral resources, but it can make the name Government Report synonymous with promptness and comprehensiveness, as well as with truth and conservatism.

Concentrates.

EMPLOYMENT AGENCIES in this city are advertising for miners at $3 per day.

REPORTS continue to come in about the deplorable condition of the miners who went to Cook inlet.

A MINER in the Goler district, Kern Co., purchased a mine for $80 and within three days found a $600 nugget.

GRANT BROS. of Salt Lake, Utah, have 150 men at work on their quartz and placer properties at Granite, Oregon.

"GELIGNITE" differ mainly from dynamite or "giant" in the fact that gelatin is the base instead of infusorial earth.

LEE & LEAVITT of Minneapolis, Minn., have bought the Columbia mine, Baker City, Or., for a price stated to be $90,000, $10,000 down.

AFTER fifteen years of litigation, the Aurora lode claim in Alaska has been disposed of, the Nowell Gold Mining Company becoming the purchaser for $16,825.

DOWNIEVILLE, Sierra county, is soon to be lighted by electricity. The abundance of free water power in the Sierras is certainly a great boon to the towns in this respect.

THE reduction works at the Providence mine, near Nevada City, Cal., were burned last Thursday morning, involving a loss of $10,000. The works will be immediately rebuilt.

DESPITE the intense heat this is the harvest time of the dry placer miners of southern California, who are busy with dry washers, in many places averaging from $2 to $5 per day.

FLAGS were half-masted everywhere through the State of Nevada and in many places in this city last Sunday, the day of the funeral of R. P. Keating, the Comstock superintendent, who died at Virginia, Nev., last week.

A CONTRACT has been let for conveying 360,000 feet of lumber from Gage Hill to the Horse Shoe Bend mine on the middle fork of the American river, to be used in building a flume to carry water from El Dorado canyon to the mine.

THE secretary of the Colorado Mining Exchange says that the gold yield of Cripple Creek district for the first six months of '96 aggregated $7,256,000, and estimates the total production of the year at $15,000,000. The '95 production was over $9,000,000.

IT is again reported that an English syndicate is negotiating for the purchase of the De Lamar mines in Lincoln Co., Nevada. This time H Bratnober is mentioned as the intermediary. These mines the owner is said to have refused $3,000,000 for.

FROM Washington, D. C., comes the statement that Secretary of the Interior Smith has "hung up" all the pending patents of California mineral land to the railroad companies till after the second session of the Fifty-fourth Congress, which convenes next December.

THE Leadville Miners' Union has decided to accept for the district the scale of wages fixed by Judge Owers for the Weldon mine, now in the hands of a receiver. The miners asked $3, but were allowed $2.50 for surface men. It is believed that the strike will soon be over.

IT is said that the gold fever has struck eastern Canada. Stock in new mines in British Columbia placed on the market in Toronto and Montreal is being snapped up eagerly. The cheaper the price of the stock the more easily it is sold. To a miner this would be an objection to the stock.

A SPOKANE COMPANY has been formed to construct and operate a power plant to supply the towns of Rossland and Trail with power to run the mining machinery of those camps. It is proposed to take power from the falls in the Pend d'Oreille river just above its confluence with the Columbia.

FROM Ripsey, Arizona, come reports of two great strikes—one of a vein of sulphurets "six feet wide, assaying $484 a ton," another of a meteor two acres in area, which "came down red and smoking" and burying five people where it struck, forming a hot mound. Both strikes are alleged to have taken place last Sunday.

THE United States tunnel project at Idaho Springs, Colorado, is a proposition to tap a number of the mines of the district. The plans call for a tunnel 3½ miles in length when completed to tap the Crown Point at the depth of 1750 feet, Russell gulch at 1500 feet, Alps mountain at 2500 feet and Quartz hill at 2200 feet.

ON the Rand, South Africa, for the first half of this year the dividends paid by mining companies—twenty-one in all—amounted to £854,851, as against £1,360,232 paid by thirty-two companies in the first half of 1895. The total production was 1,055,000 ounces, valued at about £3,500,000. The dividends, therefore, amounted to nearly 25 per cent of the output.

FABULOUS and mythical "lost diggings" are being found in these busy days of prospecting in connection with newer and mostly better finds. On the upper Clearwater above Pierce City, Idaho, the "lost placer diggings" from which the Indians many years ago drove those of the miners they failed to massacre, have been rediscovered and are now being worked.

IN the mining camps of California there is little talk of hard times and to them is due the credit of having largely decreased the number of unemployed in other parts of the State. No local paper published in the mining sections of the State fails to record the reopening of mines every month and each one of these means the furnishing of work to men out of employment.

SILVER reached the lowest figure for some time this week, when in New York commercial bars sold at 65c. Later they rallied and sold at 65⅝c. Mexican silver dollars also declined, reaching 51c from 53c. Bullion brokers have made special inquiry in London in the matter of future delivery of silver bars and learned that in the last three weeks contracts registered for the future delivery of silver have amounted to only about 60 per cent of what they were at the corresponding time last year.

FROM reports received it is evident that considerable interest is being taken in the coming convention of the California Miners' Association in this city on November 10th. Regarding officers, it is understood that the present honored president, J. H. Neff of Placer county, declines to consider further incumbency of the office of president of the association. In case Mr. Neff should positively refuse to further fill the place he has so long and creditably held, it will be necessary to choose some other practical mining man as head of the organization. It is believed that some such man as Harold T. Power, of Sunny South, Placer Co., would worthily fill the chair.

AN English syndicate proposes a novel scheme for bringing Nevada ores within reach of railroad transportation. It is to widen and deepen the Colorado river from a point in Lincoln county to the Needles and set afloat a fleet of light draft steamers to transport the ore. T. Watkins-Davis of the syndicate has already obtained options on a number of the mines in Lincoln county to be taken up in case the scheme goes through.

TEMPORARILY abandoning the old question, "What does it cost to produce an ounce of silver?" a good many papers are now editorially discussing the question "What does it cost to produce an ounce of gold?" It is as impossible to correctly answer the one as the other. As well ask, "What does it cost to support a family?" It costs $50 per annum or $50,000, according to size and surroundings. One thing, however, is assured, that, taking everything connected therewith into account, every ounce of gold mined costs $20.67 to produce it.

SECTION 181 of the State laws of Colorado provides "that every person who shall mingle or cause to be mingled with any sample of gold or silver-bearing ore any valuable metal or substance whatever that will increase or in any way change the value of said ore, with the intent to deceive, cheat or defraud any person or persons, shall, on conviction thereof, be punished by a fine of not less than $500 nor more than $1000, or by confinement in the penitentiary for a term of not less than one nor more than fourteen years, or by both such fine and imprisonment."

IT is difficult to state exactly the present gold holdings of the banks in the different cities. Just one month ago the comptroller of the currency reported the gold holdings of the prominent banks in fourteen cities of the United States as follows: New York, $48,869,499; Boston, $7,161,128; Philadelphia, $7,440,111; Chicago, $16,836,022; Baltimore, $2,020,270; Washington, $1,238,056; Cincinnati, $1,026,304; Cleveland, $1,586,275; Pittsburg, $3,283,391; Detroit, $1,188,552; Brooklyn, $628,034; Milwaukee, $2,070,680; New Orleans, $594,899; San Francisco, $1,476,502.

THE prospectus of a new British Columbia mining venture which is put upon the London market asks for a capital of £350,000. It is proposed to work the bed of the south fork of the Quesnelles river, about 9¼ miles in length, in the Cariboo district. For this purpose a dam is to be built at an estimated cost of $225,000 to hold back the waters in the Quesnelles lake. An expert claims that he obtained samples of the gravel in the bed of the river that would show $150 to $200 per cubic yard. Of the capital £270,000 is to be paid by the company for the rights granted by the legislature.

THE sale of the Diamond Hill mine, in Montana, for $2,000,000, promises to be a good thing for San Francisco mining machinery men. According to Thomas Ewing of Oakland, who assisted in the deal and will remain as general manager, most of the new machinery will probably be purchased in this city. The Scotchmen who have made the purchase intend to make extensive improvements, including a modern electric plant. The present mill is of 40 stamps, but a new one will be built of a capacity of 600 tons a day. About $250,000 will be expended in improvements.

IT is understood that Prince Poniatowski has succeeded in interesting some of the representatives of large English capital in the California Exploration Company which he organized and which has obtained bonds on a number of mines in Calaveras county. It is said that Percy Tarbutt, who is a director in Cecil Rhodes' Chartered Co. and Edmund Davis, a director in the Anglo-Continental Syndicate of London, depending upon the report of their experts, Edmund W. Jackson of Australia, Percy Tarbutt, Jr. and Richard A. Parker of South Africa have decided to take a large part of the stock in the company and thus supply the means necessary for developing the properties.

IN answer to several similar inquiries this week, it is to be said: Where several locations are held as a mining claim, work done on any one of the locations equaling in amount that which would be required on all of them, if they were separate, is enough to maintain the rights, but the locations must be contiguous, so that each location will in some way be benefited by the work done. Work may be done on the claim itself or on other ground where it has a direct relation and is in reasonable proximity to it. The work must have a direct bearing upon the improvement at working the mine itself. Under this head prospecting for the purpose of discovering ore bodies or pay channels would be included.

AN electric plant is being erected by the General Electric Company for Dr. W. H. Garlick, at Hart, in Shasta county, to supply the Texas Consolidated mine and mill with power and light. Dr. Garlick, who owns the water rights, is preparing to supply other mines and mills in the neighborhood, the whole plan being laid out with a view to extension as required. The plant now being erected is a three-phase alternating, operating at a voltage of 2080. The arrangements are to supply the Texas Consolidated with 60-horse power for the mill and rock breaker and 20 for the winze hoist. Owing to the large amount of free water in Shasta county, it is a good field for the use of electricity for working the mines.

TALKING of miners and prospectors, a mining engineer, who claims to have studied the difference between a prospector and a miner, defines them as follows: "A prospector watches every piece of float and studies its source, knowing that it never came up hill, and he sees things which no one else would ever notice to tell which way the straws are pointed. The minuteness of his detection is marvelous. On the other hand, the miner sees nothing on the surface nor in the formation of the country, and could not even select a nice rich cropping if he should stumble upon it, but when he gets inside of a tunnel he can take out the best ore in the shortest time. His instinct serves him well, but he sees nothing until he gets underground. A good prospector is seldom a good miner and vice versa. The two are opposite and distinct in their lines of action."

A FEW years ago the blue jays and mountain squirrels were contemplating taking possession of the almost abandoned town of Jackson, Amador county. Now few livelier mining towns can be found in the West, and it is no wonder that there is no complaint of hard times by scarcity of money when the following mines paid out for payroll and supplies such sums as these last month: South Eureka, $8000; Oneida, $4000; Kennedy, $20,000; Argonaut, $3500; Alma, $3,000; Anita, $2500; Zeila, $20,000; Bellwether, $2500; Jackson Gate, $1500; Union Consolidated $7,500. Total, $72,500. To this $12,500 more can be added for labor and material at other mines in the neighborhood. Most of these mines are only in process of development and when the Anita, Argonaut, Alma, Jackson Gate and Union Consolidated put up mills, as they probably all will within 18 months, and begin to take out and crush ore the pay roll of the old town of Jackson will be further increased.

SOME individuals propose reprinting the list of California mines and miners in pamphlet form. This paper collected and is publishing these names pro bono publico, did not copyright the matter, and of course now that the valuable information has been published in these columns any one has a right to make such subsequent use of it as he sees fit. It is understood, however, that business men are being solicited for advertisements in connection with the scheme of reproducing the lists. It is fitting to state that this paper has no connection in any way with the proposition. It may be further in order to say that it is difficult to see in what way any business man can possibly be benefited by the appearance of his business card in connection with this warmed-over affair. Doubtless the only ones who will see it are the advertiser himself and a few of his competitors. It cannot reach possible or probable customers, and hence is as worthless as schemes of that nature usually are. It may be added that from week to week, as the list was published herein, a large number of extra sheets, with the different installments thereon, were printed for the use and convenience of those interested, and any one who has not yet secured a set of these lists can have them gratis by applying at this office.

INNUMERABLE inquiries are being received by this paper concerning the correct status of the recent decision of the Supreme Court of the United States as to what is necessary or unnecessary to constitute a sufficient marking on the ground in the making of a mining location. In answer it can be said that at the time the advance sheets of the decision were received there appeared to be an error therein, the use of one word conveying a meaning apparently opposite to that intended by the court. Jno. M. Wright of this city addressed the company publishing the report, pointing out the supposed error, and received answer that that was official and so incorporated in the permanent report. He addressed Judge Whyte, who prepared the decision. Pending Judge Whyte's reply the matter is in abeyance. If, as is likely, a mistake has been made in transcribing the language of the court, the decision is readily understood and in accordance with existing custom and use. If it is officially endorsed and stands as it reads, it virtually announces that no location is necessary, which will hardly be accepted as law, even though it comes from the highest legal tribunal on earth. On July 28th, in the case of Howeth vs. Sullenger, the Supreme Court of this State rendered a decision on virtually the same subject, a syllabus of which appeared in "Concentrates" in the issue of the 1st inst.

CALIFORNIAN and American civil and mining engineers usually estimate very closely on the cost of work, and rarely is the estimated cost greatly augmented. That this accuracy is not universally shared is shown by experience. The estimated cost of the Manchester, England, ship canal was $28-750,000. Nearly $80,000,000 was spent before the canal was completed. An international commission reported in 1856 that the cost of digging the Suez canal would certainly not exceed $40,000,000. It cost $94,500,000 beside Egypt's gratuitous building of light-houses, dredging of the harbors, advance of money without interest, and gift of forced labor, the whole amounting to $20,000,000 more. Engineers spent a year collecting data for their report on the Congo railroad, which they asserted could be built for $5,000,000. They now say that the total cost will be $12,000,000. The notorious underestimate of the cost of the Panama canal nearly swamped that enterprise before wholesale stealing completed the ruin. The forts on the Meuse river, estimated at $4,500,000, cost $16,-000,000; the Corinth canal cost $12,000,000 instead of the estimated $6,000,000; a harbor and a railroad on the island of Reunion cost $13,500,000 instead of $6,800,000; the Senegal railroad, which was to be completed for $2,600,000, absorbed $9,000,000, and the Langson railroad in Tonkin, which was to open a conquered province for an expenditure of $500,000, cost the French treasury $4,367,790.

THE salaried officials of the Anti-Debris Association must do something to show for their wages, even if some of their supporters go hungry in want of a market for their produce. Tons of fruit and vegetables are dumped in the bay in this city in want of a market; the miners with ready money are the farmers' best customers; but that cuts no figure with the Anti-Debris Association, who would if they could cut off such a source of revenue to their constituents. The latest case is reported from the Forest Home mine, shut down under a temporary injunction secured by the association. The alleged facts are that early this year Los Angeles men spent several thousand dollars laying two miles of 18-inch steel pipe and building a hydraulic plant believed to meet all the requirements of law. A restraining solid stone impounding dam was built and accepted by the Debris Commission and a permit granted. The mine was worked with 250 inches, dropped into the Arkansaw creek ten miles from where it empties into the Cosumnes river. During the summer months this creek is dry, its course running through a large reservoir or lagoon and numerous stretches of willow thickets or marshes. With the settling in the impounding dam and the lagoon and the straining through miles of willow flats, it is considered impossible for material which could be of any appreciable damage to the river to ever reach it. In the bed of this creek and adjoining it are gravel deposits and rich placers. The farmers along the ten-mile stretch of the creek entirely agree with the miners, who claim that the law has been strictly complied with and that no damage has been done to the creek or river. The officer who served the injunction found it entirely free from deposits of tailings or even the lighter sands. The work is stopped. The whole section is as dull and devoid of money as though there was not an ounce of gold within 1000 miles of it, but the anti-debris officials, disdainful of the appeals of miners and farmers alike, who agree as to the commercial value of the work, continue to draw their salaries, paid in part by these people, and doubtless can stand it as long as anyone else.

Vein Walls.*

By T. A. RICKARD, State Geologist of Colorado.

(Condensed.)

From time immemorial the fissure vein has been held the simplest type of ore deposit. The prominence given to it by Cotta and his disciples, from their study of the mines of the *Eerzgebirge*, is impressed upon technical literature; and, in consequence, the ores which carry the valuable metals have been supposed to occur mainly in fissures, cleaving the rocks in diverse directions, and the noblest type of vein has been deemed that which cut across the country independent of its structure, whether evidenced as bedding, foliation or cleavage, and which was identified with rents produced in the rocky crust of the earth.

As so conceived the vein was a fissure filled with ore, extending through the country for a varying distance, and continuing downward to a depth more or less proportionate to its londitudinal extent. The vein material was bounded by an encasement of rock, and those immediate surfaces which limited it on either side were called "walls."

These primary conceptions have been modified by the experience of modern mining in widely separated regions. The study of lode formations has led to the recognition of notable departures from the supposed normal structure of the veins of Saxony and Cornwall, the two classic homes of early economic geology.

Typically the walls of a vein are conceived as parallel rock planes enclosing the ore, the upper one being called the "hanging" and the lower the "foot wall."

Walls are rarely alike. Even where a vein traverses a homogeneous formation, such as a massive crystalline rock, it is usually found that the surface which bounds it underneath differs from that which limits it overhead. This is to be ascribed to the effect of the agencies which brought about the deposition of the ore. The action of underground waters tends at first to affect both equally; but in many cases probably the solutions, as they slowly ascend along the line of fissuring, are prevented from penetrating into the encasing rock by the occurrence of an impermeable covering of clay, due to abrasion, which may line either wall, but, because of gravity, generally accompanies the under one. Similarly we are justified in supposing that the deposition of a mineral deposit may form a coating which would serve to protect the foot wall from the corroding effects of chemical action. The activity of the mineral bearing current thus becomes diverted in its greatest intensity toward the upper wall, where the decomposition of the rock surface may be followed by its disintegration so as to cause the exposure of fresh faces for further dissolution.

When a vein occurs in a formation composed of several kinds of rock it may cut across the lines of parting and be labeled a "true fissure;" or it may conform to them, and become a "bedded vein," if the two beds happen to be similar, or a "contact vein," if they are dissimilar. It is evident that, when a vein crosses the bedding of a series of sedimentary rocks, the differences between the enclosing walls at any given place will depend upon the thickness of the beds traversed, and the extent of the faulting of the country along the line of the fissure. When the faulting is slight the change in the wall rock will be practically simultaneous for both sides of the vein; while, when the dislocation is equal to, or exceeds, the thickness of the members of a series of dissimilar beds so intersected, the opposing walls may be entirely dissimilar.

Many veins follow the contact between the eruptive dikes and the metamorphic or sedimentary formations which they have penetrated. The dikes of quartz-andesite porphyry traversing the granitoid gneiss of the earliest mining districts of Colorado (in Boulder, Gilpin and Clear Creek counties) offer many examples of this type of vein structure. In such cases the mineralization may often be found to have spent itself on the more soluble porphyritic igneous rock, rather than upon the less soluble metamorphic. The walls of such veins will vary as the ore deposition has followed either fractures along the immediate contact, or those which ramify into the body of the dike, or those again which cut across the latter, where its irregular outline has been an obstacle to the main line of figuring.

In descriptions of lode structures mention has been made of the occurrence of clay selvage, following sometimes one, sometimes both, of the walls of a vein. This "clay" may occasionally be material precipitated from solution; ordinarily it is only crushed rock. It frequently encloses exquisite mineral specimens, because its soft consistency has permitted untrammeled crystalline growth. Most examples of well-developed crystals of native gold have been discovered under such conditions. This is the case at Cripple Creek, Col., where the gouge or clay has been dried and hardened near the surface, and as a crumbly earth, made purple by the presence of fluorite, carries beautiful crystals of gold pseudomorphic after sylvanite and calaverite. The exquisite leaf-gold specimens, for which Farncomb hill (Breckenridge, Summit county, Col.,) is so famous, are found embedded in talcose clay. Large pieces of pure argentine are often found in such an environment, as at the De Lamar mine in Owyhee county, Idaho. Wire silver also has been found in comparatively large amount encased in such a "mud" in many Leadville mines, notably at the Crown Point in 1886.

By reason of their opposition to the passage of water such seams of clay protect the rock surface of vein walls, and underneath them there will occasionally be found comparatively fresh and unaltered rock having beautifully polished faces or slickensides. At Ballarat, in Australia, I have seen many such rock faces like finished ivory in their smoothness, and streaked with black lines, due to the grinding of specks of pyrite. In the Bonanza mine, Baker county, Or., there could be seen quite recently an exquisite example of such an occurrence. In an upper drift there was at one place a surface of a few feet square (on one of the walls a gold-bearing quartz vein) covered by a thin layer of black clay, under which lay what seemed a white enamel of very remarkable delicacy. It could not be removed without breaking, because it was very friable, consisting essentially of crushed quartz partially recemented, probably by pressure.

"The handwriting on the wall" is not always easy to decipher. The lines or striæ occasionally to be seen upon its surface have been held to indicate the direction of that movement (or succession of movements) of the opposing rock planes to which the deposit of ore primarily owed the opportunity for its existence. These lines, however, sometimes have opposite directions within a short distance and offer conflicting evidence hard to explain.

Rarely is a story told more clearly than in the ripple-marked foot wall which was to be seen in October, 1891, in the Johnson's mine at Bendigo. It had been very difficult to distinguish the bedding of the country because the development of a strongly marked cleavage had obliterated the lines of original sedimentation. At the 1065-foot level, however, the matter was made plain. For more than 100 feet square the surface of the foot wall was covered with ripple markings. The crests of the waves were about 3 inches apart and presented all the little irregularities to be seen to-day when the wind blows over the shallow waters of an estuary and imprints the evidence of its action upon the yielding sand. The markings had been protected by layers of Silurian sediment, and the whole series had been indurated into rock, the sand which bore the markings becoming quartzitic sandstone, and the overlying mud slate. Between them, as within the pages of a book, was preserved the conclusive evidence of the original position of the beds of rock enclosing the reef, which had been formed in later times, when fissuring had made room for the circulation of underground waters and the deposition of the gold-bearing quartz.

In the above interesting case the corrugation of the foot wall, due to the ripple markings, rendered difficult the detachment of the ore. Distinct walls, especially when accompanied by selvage, are very useful in actual mining; but they are not by any means necessarily indicative of a productive vein, or particularly favorable to the continuity of the ore. A "clean" wall and a good "gouge" are welcomed by the miner because they ease his toil; but the idea that their presence alongside a lode gives it a character better than another unprovided with such adjuncts is a dangerous delusion. In many mines more ore has been lost through the persistent following of a "wall," without exploring beyond it, than was ever compensated for by the greater facility given by such a parting plane for the breaking of the ore found.

Many veins have no defined walls, but gradate imperceptibly into the enclosing country, and are bounded only by the commercial value of the material mined. Such veins are to be seen, for instance, in the mountains that overlook Silver Plume, Clear Creek county, Col. In the 300-foot level of the Seven-Thirty mine a fracture penetrating the metamorphic granite carries ore on both sides, which diminishes in richness as it spreads into the encasing country. The joints in the granite are evident.

In this mine the so-called "walls" are often simply two parallel veins (rich, but very small), separated by clean, hard country. On the same level further east the granitoid gneiss is traversed by two streaks of ore, of which one is much the richer. Between them there are at least two well-marked parallel fractures devoid of ore. The poorer vein has a thin selvage, under which there is a streak of quartz carrying a little silver ore; but the companion vein follows a fracture, unaccompanied by any selvage, whose upper side is impregnated with about 3 inches of tetrahedrite, galena and polybasite.

The Accumulation of Amalgam on Copper Plates.*

Communications in discussion of the paper of MR. R. T. BAYLISS, presented at the Pittsburg meeting, February, 1896.

L. D. Godshall, Everett, Washington: This very interesting paper cannot fail to command the attention of every one who has ever had experience in the amalgamation of gold ores. I wish to call attention to three very important facts brought out very prominently by the paper, namely:

1. The extent of accumulation of amalgam on copper plates in the form of scale, not removable in the ordinary manner.

2. The change in the relative quantity of the two metals in the amalgam as we recede from the battery discharge.

3. The difference in fineness of the bullion obtained from the above-mentioned scale as compared with the bullion from the daily cleanups.

From Mr. Bayliss' figures we find that during the life of the plate in question 14,942 tons of ore were crushed, yielding amalgam of the value of $5.03 per ton, or a total value of $75,158.26. The amalgam accumulating on the plate during this time as scale we find to have had a value of $8340.54, or $0.558 per ton of ore treated, representing 11.09 per cent of the total amount of amalgam saved in the ordinary cleanup; or, taking the amalgam saved by daily cleanup plus the amalgam scale as representing the total saved on this plate, or 100 per cent, we find that the daily cleanup saved 90.01 per cent, while the scale represented 9.99 per cent. The above figures do not include some additional amalgam still adhering to the plate after scale had been removed.

We are told that this was not an exceptional case at the Drum Lummon, but that other plates have even yielded a third more than the one in question. The interesting query now comes up whether this experience at the Drum Lummon is exceptional or universal at all mills; and another question arises as to how long such an accumulation might continue, and at what rate. It is to be hoped that the experience of others may be given, in order to throw additional light on this subject.

The difference in composition of the scale and ordinary amalgam is very interesting. Tabulating the results given by Mr. Bayliss, we obtain the following:

AVERAGE FINENESS OF BULLION OBTAINED FROM:

	Amalgam of Daily Cleanup.	Scale.	Amalgam from Copper Plates of Frue Vanners.
Au.	541.5	431.4	380.5
Ag.	443.9	562.5	602.0
Totals	985.4	993.9	982.5

The above shows conclusively what Mr. Bayliss claims, "that the gold fineness of bullion is highest nearest to the battery, and gives place to a steadily increasing silver fineness as the amalgam is deposited upon the copper plates at greater distance from the battery discharge."

With reference to fact No. 2, there is no doubt in my mind that the change in the composition of the amalgam as we recede from the battery discharge is caused by a difference in the tendency of the gold and silver to amalgamate, the former amalgamating more easily than the latter, and therefore more quickly, and hence being found nearer to the battery discharge.

Fact No. 3, however, is not so easily explained. In the first place, we must assume some cause for the formation of the scale. Let us call this the affinity of the amalgamated gold and silver for the amalgamated surface. I use the term "amalgamated" gold and silver, as it is evident that the gold and silver must pass through the form of amalgam before becoming scale; the next assumption, then, naturally follows that the cause of the phenomenon is a greater affinity of silver for the amalgamated (or scale-forming) surface than of gold.

Mr. Bayliss, referring to native silver in the ore, claims that the facts in the case disprove the theory which ascribes the results to such native silver. He does not, however, take into consideration that the condition of the native silver in the ore may be very different, or its behavior very different, from that of the same silver after amalgamation. In that distinction, to my mind, lies the solution to the problem.

Mechanical Progress.

A New Construction for Fly Wheel.

The first part of the following article was furnished for the MINING AND SCIENTIFIC PRESS by Mr. A. P. Brayton, the second part by Mr. Edward S. Cobb. The accompanying illustration was engraved expressly for this article.

The North Star Power Plant.—The paper read by Mr. Arthur de Wint Foote, C. E., at the meeting of the American Society of Civil Engineers, recently convened in San Francisco, elicited much interest and no small amount of discussion.

The paper referred to makes a very elaborate and exhaustive report upon the operation of the compressed air transmission plant at the North Star mine in Grass Valley, Cal., a brief description of which, compiled from this report, we here present.

The power station consists of a Pelton wheel 18 feet 6 inches in diameter, attached to the shaft of a Rix duplex air compressor, compound tandem type. The initial cylinders are 18 inches and the second cylinder 10 inches diameter, with a 24-inch stroke.

The wheel is built up of angle iron plates riveted together to break joints, and is held concentric with the shaft with twelve pairs of radial spokes of 1¼-inch rod iron secured by nuts to the cast iron hub. The driving force, being applied to the rim, is transferred to the hub by four pairs of 2-inch iron rods so arranged as to form a truss.

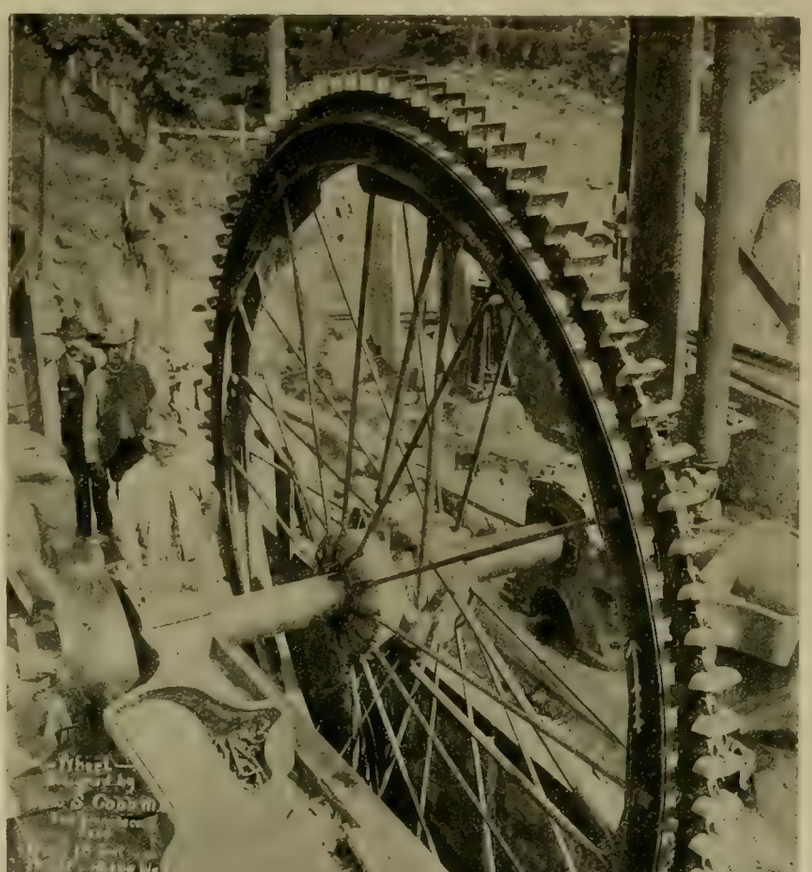
The wheel weighs 10,500 pounds and runs at 110 revolutions under 750 feet head, developing upwards of 300 H. P. It is made of this large diameter for the purpose of giving the proper speed to the compressor under the high head available. The water is applied to the wheel through a variable nozzle controlled by a hydraulic regulator, which maintains a uniform speed on the wheel with a variation from full load down to 25% of same—making its operation absolutely automatic as well as economizing the water supply—no more being used at any time than required or the work.

The wheel was made from designs furnished by Mr. Edward S. Cobb of this city, and the construction, as will be seen, forms an ingenious mechanical combination, altogether novel and without precedent, affording an ample factor of safety with a very high peripheral velocity. The water supply is brought to the wheel through two and one-half miles of 22-inch riveted pipe, affording sufficient capacity to develop 800 H. P. A 3-inch lap-weld pipe conveys the air at a pressure of 90 pounds from the power house to the company's shaft, 800 feet distant and 125 feet elevation. This is at present running a 100 H. P. pneumatic hoisting engine and a 75 H. P. compound pump, besides other pumps, drills, forges, etc.

The report above referred to shows that repeated tests on this wheel made by the most approved methods, and checked up very closely, give the remarkable efficiency of 93% at full load, also an average efficiency of something over 90% for quarter, half, three-quarter and full loads. The suggestion has been made that the extraordinary efficiency here shown is accounted for in part by its unusual dimensions. This, however, is incorrect, as equally high efficiencies have been obtained on Pelton wheels of much less than one-third this diameter.

The efficiency of compression and transmission from water wheel to motors, not including cost of reheating, is given as 73%, making a most favorable showing for the plant as a whole under the conditions here installed.

A New Construction for Fly Wheels.—The novel construction of wheel mentioned in the above article and here illustrated presents some interesting features to the engineer. At the present time the demand for high peripheral speeds is imperative in many electrical installations, and are often maintained by the use of small fly or band wheels on motors of high revolution, such as the so-called high-speed engine. However, for economy of fuel consumption, reliability of action, steadiness of motion and freedom from excessive wear, the well known Corliss type of engine has no superior. The prime objections to its use at speeds much above 70 revolutions per minute have been: first, the special form of valve gear used, and, second, the fact that large fly wheels, as usually constructed, have not been found safe at peripheral speed much over 5000 feet per minute. The first of these objections has been overcome, and we find to-day engines of the Corliss type running successfully at 135 revolutions per minute. The second objection would seem to have been overcome, if such a construction for fly wheels was used as that herewith illustrated.



Many forms of construction have been proposed for large wheels at high rotative speeds—such as wheels built up on plate webs or discs; wheels with the rims made of small segments of plates laid up in overlapping layers and rivetted; wheels made by winding wire in suitably-shaped recesses to form the rim; and, lastly, the more common form of built-up cast iron wheel. Some attempt has been made to construct large band wheels of wood, and in special cases with success. The excessive cost of large wheels when made on these forms has prohibited their general use, and, in consequence, we find comparatively few engines of the slow-speed type operating where high peripheral speed of drive wheel is needed.

The construction shown in the illustration offers many elements of advantage over those heretofore suggested. All parts, except the hub, can be constructed of rolled steel of sections of common manufacture and of known tensile strength. The rim, while it can be made up in any number of pieces, can have a strength at net cross section, which can be predetermined with accuracy for any required speed of revolution.

Every stress, acting to destroy a wheel when conveying power or acting as a balance wheel, can be accurately determined, and with this construction every such stress can be accurately provided for by material of known strength in form, adapted to simple construction. The calculations for stresses acting in the wheel illustrated show that the centrifugal force, when running at 110 revolutions per minute, produces a tensile strain in the metal of the rim alone of less than 1500 lbs. per square inch of net cross section.

Practically these wheels are simple to construct, and for wheels of large size are doubtless the cheapest so far proposed, as is shown by the fact that such wheels can be made, ready for operation, on this coast at a price of about eight cents per pound of the size and weight here illustrated—larger wheels become cheaper per pound—and they have the great advantage of known strength and stability not attainable in the best built-up wheel of cast iron of far more expensive construction.

THE cause of pitting and corrosion, says J. F. Walliker, has been discussed in every society taking an interest in boiler deterioration, but it is now a matter of universal knowledge that its harmful effects can be entirely obviated by cleanliness and care, and (or) by the use of zinc and common soda. These are applied under various patent designations, but the resultant is the same in lasting benefit to the boiler.

The almost entire disuse of oils to the pistons and valves of engines has materially contributed to the present good order of the interiors, and it cannot be too much emphasized how well the modern engine runs under these conditions. It has been claimed as a factor in the success of the water-tube boiler that the cylinders and valves of the engines are run without oil; but this system of only using the small portions passed in from the piston and other rods has long prevailed in many of our best cargo boats.

Scientific Progress.

ONE of the most singular changes which is taking place in the manufacturing industry is the giving up of the chimney to produce draught. When one looks down upon a large city and sees the immense number of chimneys, through each of which is ascending a cloud of smoke, and realizes that in these numerous clouds of smoke are contained valuable products such as benzole, ammonia and the bases of the artificial dyes, disinfectants, medicines and perfumes, one cannot but wonder that some enterprising manufacturer does not contract for the smoke of a great city. In this age of concentration, when it is so easy to see that it is much cheaper to produce a thousand horse-power with a single engine than to produce it with one hundred and one little engines, it is strange that more attention has not been paid to the systematic collection of furnace gases. Of course, it is easy to understand that the chimney offers a simple and efficient means of making the requisite draught for the fire. In one of the large works of England chimneys have been given up and a definite vacuum is held upon all fires. In this way the products of combustion and destructive distillation which result from the burning of coal and carbonaceous matter are collected, cooled, condensed and worked up. The amount of money and valuable substances wasted through the combustion of coal is immense. The problem is not so difficult as it may seem, for the production of a vacuum on the rear side of the fire, or the maintenance of air-pressure on the front side of the fire, are not either mechanically impossible or are they outlawed by cost. One of the methods which is attracting attention in Germany consists in sucking the gases of the furnaces away and allowing them to pass through water in the form of small bubbles, which removes the soot and some of the products of combustion. The gases are then lead to a gasometer from which they are drawn in the processes of utilization. A manufacture of this kind could easily extend pipes in any direction and draw the gases of combustion from other manufacturers. Aside from the value of the products thus obtained the purification of the atmosphere would be a very important result.

TO PREVENT the chemical action of acids and other corrosive liquids on metal containers and conduits and the like, C. A. Jansen places the metallic container in an electric circuit of like polarity and forms the other pole of a chemically indifferent electrode, which is immersed in the liquid in the vessel. The regulation of the current intensity requires special care. As the corrosion of linings in certain chemical operations is not only troublesome but costly, the invention may be of considerable value. It depends on the fact that when two substances act upon one another the chemical action depends upon the electrical tension between them. To protect the cellulose boilers in which the acid-resisting lining is frequently corroded one pole of a dynamo is connected to the shell of the boiler and a suitably supported axial

electrode which is insulated inside the boiler is connected to the other pole.

A MAGNET whose poles adapt themselves to the irregular surface of a piece of iron to be lifted has been recently invented. It consists of a bar of iron, around which are a number of iron rings or collars fitting it closely, between which are placed the coils encircling the iron bar, the current being such as to make alternate poles of the successive rings. The bar is lifted horizontally, and in the lower part of each of the rings there is a short, thick, iron cylinder which has a limited vertical movement; these iron cylinders will project more or less beyond the lower edge of the rings, so as to adapt themselves to an irregular surface of a piece to be lifted.

Electrical Progress.

Latest Development in Electric Motors.

Written for the MINING AND SCIENTIFIC PRESS by ORRIN E. DUNLAP.

The Buffalo & Niagara Falls Electric Light and Power Company probably has the greatest amount of electric energy at its command of any similar concern in the world.

This company became the successor of the Brush Electric Light and Power Company in the fall of 1893. Their plant was then located on the canal basin of the Niagara Falls Hydraulic Power and Manufacturing Company. In the summer of '94 the present station was built. The dynamo room contains two 300 H. P. motors made by the Westinghouse Electric and Manufacturing Company of Pittsburg, Pa. These machines show the latest and most modern development in electric motors. On the front page of this issue appear six engravings made especially for this article from photographs taken at the Niagara Falls station last week. Plate No. 1 gives an excellent idea of one of the motors, while plate No. 2 shows one of them in the station. The motors are of the self-starting induction type, designed to operate at a speed of 500 revolutions per minute when supplied with current of 3000 alternations per minute and 2000 volts pressure. The core is 36 inches in diameter and 14 inches long inside the end plates. It is built of laminated steel; each disc is punched with 120 slots around its periphery, and these discs, when superimposed one upon another, form longitudinal grooves, into which the conductors are placed. As will be seen by the illustration, the core contains five ventilating ducts, $\frac{3}{8}$ of and inch wide. The conductors consist of machine-wound coils, separately insulated with fuller-boards and mica. The winding is tapped at suitable points and the leads pass through the shafts to the rings, which receive the current from the brushes.

In plate No. 3 is displayed the stationary secondary, which is also built up of slotted steel discs. Each slot contains one rectangular copper conductor, and all the conductors are secured to an iron ring on each side of the machine. Outside the iron rings are two copper rings, each carrying 82 small copper brushes, one for each conductor. The copper rings are rotated so as to either connect or disconnect the brushes and the conductors, as is explained further on. Plate No. 4 shows that the two elements are mounted in a cast-iron frame. The machine is started as follows: The copper brushes mentioned above being disconnected from the conductors in the secondary, the switch through which current is supplied to the collector rings is closed and the motor starts. As soon as a fair speed is attained one side of the secondary is short circuited through the copper ring by connecting the copper brushes with the secondary conductors. This is accomplished by means of a ratchet movement and the handle shown in the illustration. Then the other side of the secondary is short circuited in the same manner. The object of the short-circuiting device is to limit the flow of current when starting. The iron ring, being of comparatively high resistance, prevents the induction of very large currents in the secondary, which, when the primary is at rest, acts precisely as the secondary of a transformer, and therefore if the secondary conductors were short circuited by the copper rings when the switch was thrown in, the primary current would be excessive.

Still another novel feature of this station is that the company buy as well as sell current, their purchases including both alternating and direct current. The force used to operate the Westinghouse motors is of the two-phase alternating class and flows to the station over four cables, each about one inch in diameter, laid in a tile conduit about eight feet underground. As it extends along Buffalo avenue the conduit is composed of eight 3-inch tile, to provide for other cables as the future may demand, but on the company's land the conduit is formed of one 8-inch tile, in which the cables are laid. The cables enter the lighting station on the east side and immediately after passing the wall are brought to the surface and extend up the wall, across the ceiling through a second wall into the dynamo room, where they descend to the switchboard shown in plate No. 5. This switchboard has recording meters for the kilowatt hours and is in direct connection with the power house of the Niagara Falls Power Company. It controls the current supplied to the 300 H. P. motors.

Besides the current used for operating these motors the company buys direct current from the Niagara Falls Power Company, which they distribute to planing mills, machine shops, hotels, stores and small factories for running motors. This current passes through the rotaries in the Niagara Falls Power Company's power house and is taken from the street railway feeders.

The dynamo room of this plant has undergone quite a few changes of late through the installation of the Westinghouse motors and the discarding of old light machines to make room for four new 100-light Brush 5000-volt machines. These Brush machines are of the open-coil variety, built on the general lines of the old type designed by Mr. Brush in 1877 and 1878. However, instead of being two-pole, these later machines are four-pole, having twenty-four bobbins on the armature, the armature being connected in a manner permitting the use of two brushes instead of four to a ring. The machine has twelve shaft wires, four bobbins being connected in series to two segments. The commutator is composed of three rings, each ring having eight segments. The commutator body is of iron, surrounded by insulating material covered with mica. Thus it is impossible for any portion of the commutator to become charred unless the mica is destroyed. The body of the armature is built up on a solid cast ring. The field spools are eight in number and placed over the steel magnets in the ordinary manner.

Electrical Conductivity of Aluminum.

Profs. Richards and Scott have made a test which shows the following as the electrical conductivity of aluminum:

SAMPLE.	Ohms per 1,000 ft. 0lin. diam. at 15° C.	Per cent conductivity at 25° C.	Pr. ct. variation per ° between 15° C and 80° C.
Copper	101.83	100.00	.388
Aluminum—			
No. 1, 99½ pr. ct.	161.40	63.90	.385
No. 2, 99 pr. ct.	163.80	62.17	.385
No. 3, 98 pr. ct.	181.30	56.17	.380
No. 4	174.10	58.48	.361
No. 5	185.10	55.01	.359

A French test lately showed commercially pure aluminum to have a conductivity, taking copper at 100, of 62 per cent.

THE wonders of Professor Rontgen's discovery have given great potency to the term X-ray in small places, where the people generally have little opportunity to see experiments or to gain an understanding of the strange radiance. A Lewiston, Me., dentist promises patients that tooth-filling won't hurt any more, since he has invented a "sort of X-ray process," by which an electric tric current is sent through the tooth continuously for a quarter of an hour before an operation, the electricity "carrying with it a cocaine injection, or, at least, its effects."

Practical Information.

Tempering Steel.

Many an amateur blacksmith, and, indeed, not a few professionals, are unable to temper steel properly, especially for such implements as mill picks and rock drills. To do this is easy enough, provided one knows how. The most important point is not to overheat. If cast steel is made white hot, it is spoiled; yet if a person takes a chisel, mill pick or other pointed tool to be repaired, the smith pushes it into the fire. The point is white hot. They will now put it in and out of the fire a few times, and at last bring it out red hot and work it. Of course, it is already spoiled, and, no matter how low it is tempered, it is next to useless. Take one to the smith and see that he puts the body of the tool in the fire, leaving the two thin edges uncovered till the middle is red hot. As soon as the middle is red hot, pull back and let the thin end just get a dull red heat. It must now be hammered edgeways first, and flatways last of all. It is best to hammer it on the flat part of the anvil, as drawing steel on the edge of the anvil, although a great deal quicker, makes it short in the grain and always causes the tool to break in the thinnest place. Serve the other end the same, only repeat as soon as it loses its dull-red color. The lighter the blows in working steel, the tougher it is. The point should be quite as thin as a fitter's chipping tool, only a little longer; then it will not require doing up so often. When the ends are drawn out the middle will have lost its red heat. The ends can now be filed a little. Now to temper them. Heat them in the flame of the fire, using great care. When a very dull-red heat, cool in rain water with the chill taken off, about three-fourths of an inch from the end, and let down to a blue. If it should be too brittle, a little lower. Serve the other end the same. Cool all over. Grind the edge rather blunt, and for the first few blows hit as light as possible. The secret is in working it at as possible; only keep on repeating very often, and to hit it edgeways as little as possible, but flatways as much as you like.—Blacksmith.

A COMPOUND ENGINE may have a slide-valve or other valve motion. Whether with or without slide valves, the method of starting is essentially the same. A compound engine has two or more cylinders to utilize the steam. The first cylinder receives the steam from the boiler; this first cylinder is a high-pressure cylinder; from this, after performing a certain amount of duty, the steam exhausts into a receiver, from which the second cylinder takes the steam; or, the steam may exhaust from the high pressure cylinder into the steam pipe of a low pressure cylinder. Where there is a second low pressure cylinder, the engine is styled a triple expansion engine. In the simple engine the steam, whatever the pressure used, exerts its force in only one cylinder, and exhausts directly into the air. In a condensing engine, instead of being exhausted into the atmosphere, the steam is condensed, forming a practical vacuum on one side of the piston. In a compound condensing engine the steam is first used in a high pressure cylinder, taking it from the boiler, then in one or two low pressure cylinders, then condensed, forming a vacuum on the exhaust side of the piston. The salient points of the Corliss engine (which is one of that class where the connection between the eccentric rod is broken to let the valve close quickly and effect the cut-off) are the trip mechanism for releasing the valve; its connection with the governor; the dash pot, or device for closing the valve without jar; the wrist motion, reducing the motion of the valve after opening the steam port. In the ordinary steam engine the steam is admitted to and released from each end of the steam cylinder by a valve actuated by the engine itself. The plain, hollowed slide valve is the simplest and commonest form. The earliest point at which it can cut off steam without choking the exhaust is about two-thirds of the stroke; so that for economy's sake in high pressure engines, or vacuum condensing engines, a different method is commonly used.

Silver and Gold Holdings.

The following is an estimate of gold and silver holdings of leading banks of the world:

	Gold.	*Silver.*
German Reichs Bank	$145,500,000	$70,000,000
Other German banks	19,400,000	1,000,000
German Imperial war fund.	30,000,000	.....
Bank of England	284,400 000	8,000,000
Other English banks	40,000,000	.....
Scotch banks	21,800,000	4,000,000
Irish banks	14,000,000	2,000,000
Austro-Hungarian Bank	114 000,000	54,000,000
Austro-Hungarian treasury	81,400,000	.....
Bank of Italy	60,600,000	11,000,000
Bank of Naples	21,200,000	2,000,000
Bank of Sicily	7,000,000	400,000
Treasury of Italy	17,400,000	2,200,000
National Bank of Belgium.	16,600,000	2,600,000
National Bank of Greece	400,000	.....
National Bank of Roumania	11,800,000	1,000,000
Bank of Spain	42,000,000	56,800,000
Bank of Holland	15,200,000	35,000,000
Bank of Algiers	3,200,000	3,200,000
Bank of Portugal	5,400,000	9,400,000
Bank of Sweden	6,800,000	800,000
Bank of Norway	6,600,000	.....
Bank of Denmark	18,600,000	.....
Bank of Servia	1,200,000	1,000,000
Bank of Bulgaria	200,000	400,000
Bank of Finland	4,400,000	600,000
Swedish banks	2,200,000	800,000
Swiss banks	17,200,000	1,600,000
Bank of Russia	454,400,000	5,200,000
Imperial Treasury of Russia	68,200,000	.....
National banks of New York	62,000,000	.....
National banks of United States outside of New York	85,200,000	13,600,000
Treasury of the United States	100,000,000	532,400,000
Australian banks	100,000,000	.....
Totals	$2,234,600,000	$1,074,400,000

Recent California Mining Incorporations.

Berry Creek G. M. Co., S. F.; H. H. Lee, W. B. Lee, F. C. Gehricke, J. D. Drake, S. F.; J. C. Diamond, Butte County; capital stock $1,000,000, all subscribed.

Gold Bank Mining Co., S. F.; S. P. Stow, Goleta, V. and N. Stow, S. F., W. W. Stow, Jr., Santa Maria, H. P. Stow, Forbestown; capital stock $1,000,000, all subscribed.

Minaret Gold, Silver and Mining Co., Fresno; C. J. Beck, Neals, W. J. Tinnin, T. E. Hughes, C. Kershey, M. P. Miner, Fresno; capital stock $500,000, $400,000 subscribed.

Montezuma Mining and Milling Co., Los Angeles; W. E. and B. M. Howard, S. H. and P. L. Griffin, J. H. Huron, Los Angeles; capital stock $100,000, $65,000 subscribed.

Commercial Paragraphs.

BROWN & ZIMMERMAN have purchased a No. 6 Smith mill, eighteen tons capacity, to go to Red Rock mining district, Cal.

ON August 18th the Baker Iron Works of Los Angeles shipped to F. E. Slutman, Waterman Station, one 2-stamp mill, with engine and boiler; complete weight 900 pounds.

THE Truax Car Company, Denver, Col., report having shipped 24 of their ore cars to Guggenheim's smelter, in Mexico, 4 to A. M. Holter, Helena, Mont., and 5 to the Isabella Mining Company, Cripple Creek, Col.

THE Treasury Department announces that from official information from twenty-one countries it is learned that the coinage of silver during the calendar year 1895 amounted to $113,672,000. Of this sum $13,603,200 was recoinage. Deducting this from the total coinage gives the coinage of silver from new bullion as $100,069,000. The country coining the largest amount was Mexico, with $24,832,350, followed by Japan, with $23,883,500; China, $8,233,340; Spain, $7,969,000; Great Britain, $5,821,151; United States, $5,698,000; Austro-Hungary, $5,299,000; Peru, $4,073,000; Russia, $3,554,000; Ecuador, $2,500,000; Germany, $1,826,000. The silver coinage by Great Britain during the year for her colonies was $3,808,130. France coined for Indo-China $6,092,000 and for Morocco $354,600. From January 1st to August 1st, 1895, the coinage of silver dollars by the mints of the United States was $8,562,412. The world's product of silver during the calendar year 1895 is estimated to have been $226,000,000.

CALIFORNIA MINES AND MINERS.*

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUGUST 11, 1896.

565,606.—BALING PRESS—A. Barrett, Puyallup, Wash.

565,828.—CARBURETER—D. Best, San Leandro, Cal.

565,426.—CURLING IRON HEATER—Bowman & Kerr, Mt. Vernon, Wash.

565,611.—WHEEL TIRE—H. J. Dykes, Peralta, Cal.

565,617.—WINDOW—J. J. Hall, Los Angeles, Cal.

565,765.—WRITING PAD—W. T. Martin, Dayton, Wash.

565,497.—MINER'S IMPLEMENT—T. J. Murray, Grub Gulch, Cal.

565,503.—TANK—F. H. Pfluger, Portland, Or.

565,569.—PIPE CUTTER—Roberts & Hollister, Downey, Cal.

565,801.—RAILWAY RAIL PLATE—C. J. Schenck, Gila Bend, A. T.

565,802.—FAUCET—C. J. Schuster, S. F.

565,517.—CAR COUPLING—W. Shay, East Portland, Or.

565,805.—AIR SHIP—C. A. Smith, S. F.

565,608.—HOSE CLAMP—C. Sparks, Pacific Grove, Cal.

565,646.—FORCE PUMP—A. W. Thierkoff, Redding, Cal.

565,654.—CREAM SEPARATOR—T. Willing, Astoria, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VALVE FOR SIPHON BOTTLES.—Frank E. Morrill, San Francisco, Cal. No. 565,173. Dated August 4th, 1896. This invention relates to an improvement in valves for that class of bottles which are adapted to contain effervescent liquids under pressure, and which are known as "siphon bottles." The object of this invention is to so connect the valve with a movable actuating piston that the valve is opened by a direct pull of the piston, thus preventing the valve from becoming so seated that it cannot be opened to allow of the escape of the liquid. It consists in the metallic perforated head having a projecting stem, and a rubber diaphragm cast about and enclosing said head and filling the perforations thereof to form a bond; a plunger and a means for permanently connecting it with a projecting stem so that the movements of the plunger are conveyed directly to move the central portion of the diaphragm.

PULVERIZING MILLS.—Thomas McGlew, San Francisco, Cal. No. 565,176. Dated August 4th, 1896. This invention relates to an apparatus for pulverizing and grinding ores or other material, and consists in the combination of a series of vertically journaled concaved rollers with a circular pan having a concaved die around its periphery, and interposed balls which are caused to travel around between the rollers and the pan by motion transmitted to them through the movement of the rollers around a central axis, said rollers being also turnable about their own axis. The rotatable concave-faced rollers are carried by arms and suspended out of contact with the bottom of the pan, the balls fitting the spaces between each adjacent pair of rollers and between these and the periphery of the pan, so that as the balls roll against the interior of the pan they are caused to rotate upon their own centers and in turn transmit motion to rotate the rollers upon their own axis while revolving about the central axis upon which they are supported.

SASH FASTENER.—Frederick E. Jarvis, Oakland, Cal. No. 565,168. Dated August 4th, 1896. This invention relates to a device for locking the sashes of windows so as to prevent their being opened without the use of the proper key. It consists of spring-actuated bolts movable at right angles with each other, one of said bolts engaging holes so as to lock the lower sash and the other to lock the upper sash, a spindle having a cam adapted to engage the lug upon one of the bolts whereby the upper sash is released, and arms engaging the lower bolt to release the lower sash, a case within which the mechanism is contained, an elastic arm upon the spindle adapted to engage a lug on the cover of the case to prevent the turning of the spindle and a key engaging slots in the exposed end of the spindle to first disengage the arm from the stop lug and then to turn the spindle so as to withdraw the bolts.

ICE PALACE.—Charles F. McGlashan, Truckee, Cal. No. 565,175. Dated August 4th, 1896. This invention relates to a method of constructing framework to be afterwards covered with ice so as to form what is known as an "ice palace." It consists of a structure comprising parallel walls of permanent openwork material, an intermediate filling of filiform substance and a mass of ice enclosing the walls and filling and supported thereby, this mass being produced by spraying or distributing water through and over the same in a freezing temperature so as to produce a solid body.

VEHICLE WHEEL TIRE.—Hugh J. Dykes, Peralta, Cal. No. 565,611. Dated August 11, 1896. The object of this invention is to provide a tire of the cushion class which shall be simple in construction, not liable to get out of order, and which will avoid all the difficulties, particularly puncturing, of pneumatic tires, and at the same time shall be very light and durable. The tire consists of a body composed of cork, in sections or otherwise, said cork being circumferentially ground, a tie line seated in said groove whereby the cork is held to the rim, an independent cushion circumferentially directed and seated in the groove of the cork body and a covering over said cushion and body.

CARBURETER.—Daniel Best, San Leandro, Cal. No. 565,828. Dated August 11, 1896. This invention relates to that class of gas generators which are adapted to be used in connection with explosive engines, and in which the oil or substance to be vaporized is passed through a generating chamber, where it is subjected to heat either from the exhaust of the engine or otherwise, and the vapor thus produced is mingled with air which is admitted in proper proportions to produce an explosive compound. It consists of concentric casings with exterior air inlets and interior air exits, cones disposed within the interior chamber, an inlet through which oil is admitted and distributed over the surfaces of the cones, where it is vaporized and mingled with the air, an outlet through which the explosive gas or vapor is discharged and an intermediate space or passage through which heat is transmitted between the air chamber and the oil chamber.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bonafide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

The 43rd Great State Fair of California

WILL BE HELD AT

1896=SACRAMENTO=1896

THREE WEEKS. - - - - - - - SEPTEMBER 1st to 19th.

The Soil Products of this great State will be a leading feature.

The Mechanical Display will be as attractive as usual, and made up of live exhibits of machinery and neat designs of goods.

The Live Stock will form a most important division of this season's exhibit; competitive tests will be held among the various dairy and beef breeds of cattle.

The Poultry Exhibit will form one of the most interesting features of the Fair.

The Racing Programme will be of unusual excellence, inviting contests between the highest class of horses.

The Exposition Building will be a blaze of electricity, affording every advantage for the exhibition of all kinds of articles.

Electric Motive Power generated at Folsom, twenty-two miles distant, will turn every wheel and furnish brilliant lights for the entire exhibition. Space, power and light furnished free to all exhibitors.

The Mining Interest will be represented by an exhibit of ores and a series of rock-drilling contests, showing accuracy and dispatch in this kind of work.

Cassasa's Great Exposition Band will give high-class concerts at the Pavilion each evening.

The Manufactures of California can meet the consumer to a better advantage at the State Fair, by reason of its varied attractions, than at any other public gathering in the State. Exhibit your goods and let the people know what is made at home.

Free transportation for exhibits and reduced rates of fare will be given on all railroads. Address the Secretary for information of any character Premium lists now ready.

EDWIN F. SMITH, Secretary. C. M. CHASE, President.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Mining Summary.

CALIFORNIA.

Amador.

Gravel mines are being reopened near the Rancheria mines, which produced a large amount of gold in early days, and the results so far promise well.

At the Central Eureka the new machinery was started up last week.

It is reported that the Maximilian mine, owned by George Allen, has been sold for $30,000.

The station has been cut on the 1300-foot level in the Argonaut.

A new steam hoisting plant is being put in at the Oneida, which is being developed by the Exploration Company of London.

The large three-compartment shaft in the Bellwether mine near Jackson is down 100 feet.

The 10-stamp mill of the Good Hope mine will be in operation September 1st.

The compressor at the Central Eureka is now in place and work has been resumed.

The old Mechanics mill of 10 stamps has been hauled from Sutter Creek, to be erected on the Good Hope property.

At the Reward mine, near Pine Grove, it is proposed to increase the number of stamps in the mill from 5 to 15 or 20.

There are 125 men now employed in the Wildman and Mahoney mines.

Republican: At the Wieland mine the repairs have been made and the machinery is again in working order. The superintendent reports that some good rock had been struck.

At the Fellowcraft, formerly the Bodie mill, the company is erecting a 10-stamp mill on the property which will shortly be completed, and they hope to be running in three weeks. So far the work in the mine has only been in the direction of cleaning up and putting in new appliances. The shaft is down 220 feet and ore of a low but pay grade was found all the way from the top down. Prof. Hobbs, professor of chemistry in the Western Reserve University, is manager of the mine.

There are in the neighborhood of Sutter Creek forty-seven mills running night and day. None are over a mile apart and two are within five blocks of the postoffice. Some of them are the Kennedy, 40 stamps; South Eureka, 20; Mohona, 40; Wildman, 40; Spring Hill, 40; Keystone, 40; Bunker Hill, 40. And yet with all these mills this mining district is still in its infancy, and there are yet undeveloped mines here that would yield millions if men with capital would take hold.

Butte.

It is reported that Messrs. Diamond and Chambers will shortly erect a 60-stamp mill on Brush creek.

W. W. McMillan is beginning to ship quartz from the Resumption mine to the Phœnix mill.

Mercury: The two elevators of the Golden Feather, Limited, lift 18,000,000 gallons of water each in 24 hours for a distance of over 50 feet, or 2000 tons of gravel per hour, the same distance. There is used 460 inches of water, with a pressure of 155 pounds to the square inch for each elevator. The elevators are patented by Mr. Geo. H. Evans, manager of the English syndicate mines.

Calaveras.

At the Esperanza, formerly the Boston mine, near Mokelumne Hill, 20 stamps are running regularly and 10 stamps are being added.

Prospect: A man at the Lewis mine at Copperopolis dug out a nugget valued at $150. A few months ago a chispa was found in this mine valued at $270.

At the Gwin mine the work of grading for the 40-stamp mill has been completed and building will commence this week. The shaft is now down over 1335 feet and stations are being dug at the 1200 and 1300-foot levels.

The tunnel in the Hexter Mining Co.'s claim at Mokelumne Hill has reached a depth of 450 feet. The purpose of the company is to tap the great Stockton Hill gravel channel and also a large quartz ledge which passes through the mountain.

It is reported that the Hartman blue gravel mine in Old Woman's gulch has been bonded to San Francisco parties for $10,000, and the work of putting up a hoist and sinking a new shaft will be begun at once.

Citizen: Work on the Bund mine is being diligently prosecuted under the directions of the California Exploration Company.

The new 70-horse power boiler for the Fellowcraft mine was brought up from Valley Springs last week.

Angels *Voice*: Superintendent Hooper of the Falcon mine has suspended work in all the drifts and tunnels and concentrated his force on the main shaft, which will be driven to greater depths as fast as eight-hour shifts are able to do so.

El Dorado.

(Special Correspondence).—The Boulder, 16 miles southwest of here, started the new 10-stamp mill ten days ago. Everything moves along like the mechanism of a well-regulated timepiece.

At the Baltic, 25 miles east, the shaft is 90 feet, a tunnel is in 260 feet and a drift on the vein is 310 feet. The ledge is 4½ feet of good ore. There are 500 tons of rock ready for milling.

Papers were made of record last week bonding the Pyramid mine and mill to G. P. Rixford of San Francisco. This property is three miles from Shingle Springs.

The Lucky Marion, near Greenwood, is preparing to erect a 10-stamp mill.

On the Welch mine, 17 miles north of Placerville, two shifts began underground work last week.

The Big Four—Messrs. Rhodes, O'Brien, Humphreys and Horning—who have been prospecting the county for the past few months, have a bond on Judge Bennet's property, near Garden valley, ten miles north of here. Their shaft is in about 50 feet. They milled 37 tons of ore at the Big Sandy, which netted them $12 per ton in free gold. These men are an intelligent advance guard in their method of prospecting and developing a mine.

Barry, Carmen & Goff of Oakland are opening a claim two miles east of Clarksville, in the western portion of this county. Their tunnel to crosscut the ledge is 250 feet. At the bottom of a 40-foot shaft the ledge is 3 feet in good ore.

The advent in the mining field at Kelsey of a vivacious young lady in the person of Miss Maggie Kelly, as a practical operator, is encouraging even sturdy men to take more active interest in developing the slumbering resources of that section. Kelsey is six miles north of Placerville, and its old time properties abandoned at water-depth carry good records as producers. They are justly receiving new attention.

The Victor Quartz Mining Company began last week on preparations for sinking shafts and running tunnel. This is near Slate mountain, ten miles northeast of here.

Work on the Blue Gouge is progressing favorably, and though it is still of an experimental nature, the results are very gratifying. It is 25 miles east of here and is controlled by Head, Bishop, Bind & Reeg.

Despite campaign matters, activity in searching for mining properties is not waning in this section. There are a dozen mining capitalists from abroad here at present writing.

Placerville, Cal., Aug. 18th, '96.

Gazette: The Welch mine at Greenwood, which has been closed on account of bad air, is again in operation with two shifts of men.

J. T. Smith has bought the White Elephant mine of the Lee Bros. at Greenwood.

The Lucky Maran has closed down until the company can get their mill up.

Democrat: The new mill at the Boulder mine, sixteen miles southwest of Placerville, has started up. Since April the owners have built 2600 feet of tramway, eight miles of ditch, seven miles of roads, and done 1500 feet of underground work, built and started a 10-stamp mill.

Kern.

Californian: In the Randsburg district there is not an idle man in camp. The only drawback is want of water, which is hauled twelve miles from Garlock and sells for $2 a barrel. At Garlock is an 8-stamp custom mill and six miles below another of 5 stamps. Patrick Reddy, the lawyer, who owns a one-fourth interest in the Burcham claim, has a project on hand to supply the camp with water by a pipe line from a water location at Garlock.

The Mammoth, Little Mammoth and Tom Lane mines, in Kern county, have been purchased by the Los Angeles Gold Mining Company. The company consists of H. M. Russell, N. F. Wilshire and O. Pooley of Los Angeles. The present owners will put up a 10-stamp mill at once, which will be worked by water power generated from the Kern river. They will also put up a tramway to conduct the ore from the mine to the mill. The ore, which is free gold, will be worked by cyanide process.

Mariposa.

(Special Correspondence).—John S. Wilbur, formerly superintendent of the Valley road at Stockton has sold the Reynolds group of mines on the North Fork of the Merced river, 12 miles from Coulterville. The Reynolds mines are in what is known as the eastern belt of the mother lode, and a substantial amount of prospecting and development work has been done on the property.

There is nothing doing on the Mariposa grant of any importance. By last accounts John D. Ludwig, the superintendent, was visiting in Tennessee.

Chas. T. Lindner has arranged a sale of his Powhattan, Tennessee, Independent, Constitution, Marion and Ticonderoga claims on the North Fork river four miles from Benton Mills. These claims, which are as well situated as any in the district for easy and cheap working, will be operated by a strong company which is now being incorporated.

Angus Mackintosh has bought the Hayseed and Triumph mines for $10,000 from James B. and James H. Helms. These mines are situated about one mile from the Tendron mine at Whitlocks and six miles north of Mariposa. The Messrs. Helms have worked them at a profit for twelve years past with very imperfect machinery. Mr. Mackintosh will now equip them with a complete new plant.

The Sellick mine at Haywards, four miles from La Grange, is making good progress under the direction of J. F. Clapp, a Chicago mining expert. The shaft is down 150 feet and drifts are being driven both ways on the ledge. The rock shows free gold in considerable quantity. A hoisting plant and mill will be put in position shortly. Mr. Heaton, formerly of the old Dan Heaton mine is superintendent.

Captain A. H. Ward is now in Coulterville, and has resumed development work on the Penon Blanco mine.

The Merced Gold Mining Company continues work as usual and development goes on steadily.

The Melvina shaft is now down about 600 feet, and sinking will continue as quickly as possible for at least another 400 feet.

The Tyro mine, one mile from Coulterville, is working full-handed and the mill is running night and day. The mill returns are not made public but are understood to be satisfactory. The rock being crushed is from the 700-foot level. The Laura La Grange mine at Sugar Pine Gap, near Hazel Green, thirty miles above Coulterville is doubling its mill capacity. The owners, Messrs. Macfarlane and Duncan, have been working with five stamps, making test runs. They propose to add another five stamps and will now crush for revenue. The rock is very easy to mine and mill, and the mill tests, so far made, have shown it to be worth from $30 to $50 a ton.

Dr. E. S. O'Brien of Merced and partners are doing extensive development work on the Mabel and Ethel mine near Mariposa.

It is stated that the Red Banks mines, eight miles southeast of Coulterville, have been shut down for the present. Material is on the ground for the construction of a dam in the Merced river for power purposes. The dam was to have been begun by this time but recent rains in the Yosemite Valley have raised the river and caused the delay necessitating stoppage of work.

The Bunker Hill Mining, Milling and Power Company has acquired the Bunker Hill, Monster and Emmett mines about six miles southeast of Coulterville and have put a crew of men to work. The company is arranging for the immediate erection of a 10-stamp mill, and within a years' time expects to have enough ore opened out to supply a 20-stamp mill for at least twenty years to come. The superintendent is Wm. B. McSherry.

Chas. T. Lindner, electrical engineer, has completed the prelimenary syndicate which is to erect an extensive distributing electrical power plant near Benton Mills. The water power for generation purposes is taken from the Merced river at the Broadhead old dam, about eight miles above the site of the power station. There is a fall of about 275 feet, which will give a capacity of at least 5000 horse power in the driest season. Messrs. Allardt and Luckhardt will arrive on the ground next week to complete the final surveys and lay out the construction work.

Coulterville, Cal., Aug. 18, '96.

Mono.

In the Bodie Con. on the 200 level the long east crosscut is advanced 16 feet, cutting small seams of quartz. The Gildea raise through the old stope was extended 25 feet in gold fillings. On the 300 level the raise from the long east crosscut on the second soft vein was extended 17 feet, connecting with the 200 level. The north drift from the 550 incline level was advanced 8 feet on a 2-inch streak of high grade ore. In the Fortuna vein they are stoping out a small pillar of ore below the 550 incline level. Extracted during the week 2½ tons of $25 fillings from the Gildea vein.

In the Mono mine, on the 400 level, the track and air-pipe have been removed from the east crosscut from the south drift, and the track has been laid in the Bodie Con. south drift on the Fortuna vein, the same having been cleared out. Work will begin in the face of the drift immediately. The surveying work in the recent crosscut and other workings that are open on the 400 level is completed.

Nevada.

It is reported that pay quartz has been struck in the Summit mine.

A strike of high-grade ore on the 600-foot level of the old Pittsburg mine in Gold Flat is reported.

Transcript: The repairs and improvements at the Providence Mining Company's 40-stamp mill are going forward.

The mine never looked better than it does now; and although a number of men were laid off when the repairs to the mill were begun, they will all be put on again as soon as the mill is running at its full capacity. There is ore enough in sight to keep the mill running indefinitely.

Transcript: A quartz ledge has been struck on the 600 level at the Pittsburg mine. For some time past tributers have been working the mine and making good pay.

Union: Superintendent Mather of the Plumbago, above Moore's Flat, reports that the mine is looking fine. It will be remembered that a few months ago some rich ore was taken out, and it now looks as if the present strike will turn out better than the first one.

Placer.

Colfax *Sentinel*: The Hidden Treasure at Sunny South had one of the best cleanups last month that it has had for years. Nearly 100 men are employed at the mine.

Captain Montgomery, owner of the La Trinidad mine in Sailor canyon will place a mill on the property this season. Fifteen men are now employed.

The Wild Yankee, owned by Schilliansky, Oakes & Co. of Towle, near the old Develey claim, about a half mile from Shady Run, has been put in shape for next winter's work.

The Redstone mine at Blue Canyon, purchased last spring by an Eastern company, is now operating in good shape with a 10-stamp mill and the ore looks very promising.

Some good paying gravel was struck in the Alta mine last week. It is of the same nature as that within the Hidden Treasure.

A strike is reported to have been made in the Westchester tunnel on the Black Hawk drift mine, near Forest Hill, which was originally started in 1857.

A new drift mine is being operated at Codfish Point, three miles below the Wise and Partridge claim, on the south side of the American river.

Preparations are being made to run a 500-foot tunnel from Devil's Canyon into the channel on the Ashland claim, recently purchased by A. Clark from G. S. Sanborn.

E. A. Wiltsee of San Francisco has charge of the development work at the Drummond quartz mine. A contract has been let to run 5200 feet of tunnel to tap the ledge 400 feet below the present workings.

Plumas.

The mill at the Genesee Valley Mining Company's mine has been destroyed by fire, caused by a defective stove pipe. It is understood that the company will rebuild immediately.

Work has been resumed at the Swearington mine.

San Diego.

(Special Correspondence).—At Rice mining district Messrs. Frizell, Bevinton and Farnsworth took $100 in gold out of three tons of N. G. ore last week.

All ore to be crushed from the Rice mining district has to be taken to Banner to Bailey's mill, a distance of 17 miles. This shows a mill is required in the district.

Twelve miles distant from the Rice mining camp lies the Chewawa district. The ledge has been bonded to a Fallbrook company. They call it the U. S. Mint. Rice Brothers are there.

At Banner district, at Cout's mine, on Sunday, the main shaft is in 200 feet; they are still sinking. The "Rancheta" is the name of his mine. I met Frank M. Leland there. He represents the Risdon Iron Works in San Francisco. A mill of five stamps is going up immediately.

N. Bayley is at work on his mine, called the "Kentuck."

At Julian the Owens mine is at work, a force of men being employed. Things are brighter in Julian than usual in mining.

Julian, Cal., Aug. 14th, '96.

The Nectar mines, Picacho, have been bought by a Philadelphia syndicate. Development will immediately follow, and a large mill is to be added.

The Venturina Mining and Milling Company's mining claim is located one mile southwest of Banner, and is composed of the Cable, Vevay, Fraction and Switzerland mines. Three gold quartz ledges are on the property, all of which have been good producers. The company has lately let a contract for 400 feet of extension to a tunnel now in 260 feet. This is expected to tap a rich chute of ore at a depth of 400 feet, which has milled from $40 to $60 per ton near the surface. The address of the company is San Diego.

Sierra.

Messenger: The Garnett Gold Mining Company, lately organized, has acquired the property known as the Bunker Hill and Niagara Consolidated gravel mines, situated above Gibsonville, the former being in Plumas and the latter in Sierra county, and adjoining each other.

Siskiyou.

Journal: At the Mabel mine, near Scott Bar, 150 tons of ore await the new mill.

The new company which has just purchased the Ben Shinar mine on the Klamath river, at Thompson creek, is making preparations for working its new mine on an extensive scale.

It is said that the hills around Sawyer's Bar are full of prospectors, and some good mines have been located this season.

Journal: The new quartz mill at the Nebraska mine on Cherry creek is to be started up soon.

Fernandez & Co., of the placer mine on Cherry creek, brought to the Siskiyou County Bank in this place last Saturday 543 ounces of gold dust, the result of the past season's work of 20 men employed.

The Steamboat mine, in McAdam's creek, will be started up again and will be worked on an extensive scale. The machinery which was put in about a year ago is the best that could be found, and the company that owns it has plenty of capital; so the mine will be worked for all there is in it.

At the Bailey & Carrick mine, at Greenhorn, they are about ready for another crushing.

Trinity.

Under date of the 12th inst., J. S. Strode writes from Trinity Center that his mine, the Oro Grande, is the only one in that district running a stamp mill, and is not sold or bonded to any one.

Tuolumne.

A contract for the masonry work of the new hoist at the Dutch has been let.

The tunnel between the Shawmut and Eagle, which will be 5700 feet in length, will be completed next month.

San Francisco capitalists have beeen examining the Frank Marcom mine with a view to its purchase.

NEVADA.

STOREY COUNTY.

The Con. Cal. & Va., reports: West crosscut 2, started at a point in north drift 550 feet north from Con. Va. shaft station, or 85 feet south from north boundary line of mine, has been extended 30 feet, passing through porphyry and clay with lines of quartz assaying $1 per ton; total length 570 feet. Face is dry and does not show any seepage of water. On the 1650 level, on ninth floor, first floor above sill floor of this level, the south drift from east crosscut from drift run south from end of the stope has been extended 19 feet, passing through porphyry, clay and quartz assaying $1 and $2 per ton; total length 509 feet.

On the 1750 level, from thirteenth, fifteenth, twenty-first and twenty-second floors above sill floor of this level, at north end of stope in old ground of former workings, have extracted during the week 142 tons of ore, average assay value of which, per samples taken from cars in mine, was $49.76 per ton. South drift from twenty-fourth floor from end of west drift has been extended 9 feet, through old stopes and fillings, assaying $20 to $30 per ton. Total length 15 feet. From upraise carried up from northwest drift from main west drift from C. & C. shaft, 50 feet above sill floor of this level, from end of east crosscut No. 2, a north drift has been advanced 28 feet, through porphyry and quartz, assaying $3 and $4 per ton. Total length 56 feet. Total extraction of ore for week amounted to 142 tons, average assay value of which, per sample taken from cars when raised to surface, was $45.65 per ton.

On the Brunswick lode at shaft No. 1 the shaft has been sunk 15 feet on the incline, passing through porphyry and stringers of quartz; total depth 566 feet. On the 300 level they have advanced main north drift from station 57 feet; total length 238 feet. The face is in porphyry and stringers of quartz.

On the 200 level in Chollar the south drift has been advanced 17 feet and is now out 246 feet south from the Chollar north line; the face is partly in the foot wall, a small streak

of quartz and soft porphyry being exposed. On the 300 level the south drift has been advanced 42 feet and is now out 163 feet south of the north line. For a distance of 155 feet south of the north line the face shows a width of from 18 inches to 2 feet of good ore, since which time porphyry has predominated.

Shaft No 2 was sunk 10 feet on the incline; total depth 317 feet; bottom in hard porphyry. On the 150 level the main south drift, started from east crosscut No. 1, was extended 8 feet; total length 129 feet; face in porphyry and stringers of quartz.

Chollar shipped to the Nevada mill for reduction during the past week 120 tons and 1400 pounds of ore, car samples averaging $32 per ton.

In Alta the west drift on 725 level was driven 24 feet in hard trachyte; total length 100 feet. The winze in the Keystone vein, 825 level, was sunk 6 feet in quartz of some value; total depth 30 feet.

In Occidental on the 550 level have discontinued drifting and have started a west crosscut from the hanging wall, which has been extended 25 feet; face in porphyry. On 650 level we have advanced 30 feet; total distance 75 feet; face in vein matter. The raise from the 750 to this level has been advanced 31 feet. The south drift on 750 from the west crosscut has been extended 22 feet; total length 167 feet; face in low-grade ore. The winze started in the north drift is down 43 feet, and shows 2 feet of $20 ore in the bottom; advanced during the week 23 feet.

In the Savage mine on the 850 level the south drift from the fifth floor of the north upraise they have started three east crosscuts at points 35, 70 and 110 feet respectively south of the north upraise. East crosscut 1 is advanced 11 feet, passing through seams of quartz giving low assays. East crosscuts 2 and 3 are each advanced 12 feet and the face of each is in porphyry. The main south drift is advanced 82 feet. The face is in quartz giving some fair assays. East crosscut 3 is advanced 45 feet. The face is in clay and porphyry. On the 750 level the east crosscut from the main south drift is advanced 33 feet. The face is in porphyry and quartz. On the 950 level they are repairing and retimbering the airway leading to the Hale & Norcross mine.

OREGON.

EASTERN OREGON.

(Special Correspondence).—More than the usual degree of activity exists in the Cornucopia district, near Baker City. Reliable reports from that section are encouraging. They indicate that much more is being accomplished this season than any previous, and that the district is attracting the attention of investors and operators from other States.

The Virtue mine, which is owned by G. W. Grayson of San Francisco, is working about 40 men, developing mainly. A tunnel is being extended and a shaft is being sunk. The ore produced incidental to this work is shipped to Denver. The litigation in which the property is involved, it is anticipated, will reach a conclusion within a few weeks.

The Baisley-Elkhorn mine, located about 22 miles from the Virtue, is also pushing development with a force of about 30 men, and it is reported to be making a good showing. The upper levels were formerly pretty well worked out, but the company is now doing some sinking. The ore from this property is shipped to the Tacoma smelter.

The Flagstaff property, in the same district, owned by a French syndicate, recently began development work.

The group owned by W. A. Clark & Co., of Butte is being worked with a small force, and the White Swan, owned by Baker City people, is developing and shipping ore.

A number of properties in Crocker Creek country and in the Durkee district, both east of Baker City, are reported more or less active, but as yet no regular producing mines have resulted.

At Rocky Bar, Idaho, the Elmore Mining Company is developing its property and has put in an electric plant for light and to operate its drills.

Baker City, Aug. 15, '96.

Jacksonville *Times*: Minneapolis parties have paid $5000 to close the deal for the purchase of the Columbia mine on Cracker creek, Baker county. The balance of the $75,000 will be paid in a short time.

Palmer & Co. have resumed work on their ledge in Farmer's Flat district.

W. W. Mason, the mining expert, who has been examining the Miller ledge on Soldier creek, Josephine county, is building an arrastra, and a crosscut at 30 feet deep shows a body of good ore.

WASHINGTON.

The Okanogan mine, at Methow, has been sold to Seattle men.

The Red Shirt mine, Silver, Okanogan Co., has been sold to a Scotch syndicate. J. A. Stewart, the superintendent, will build a 20-stamp mill this fall.

Customs business of $5,000,000 for the port of Northport in one year is a record which few custom houses in the United States can equal. The balance of trade is in the United States' favor. The value of silver lead ores up to June 30th passing through the officials' hands, and on which duty has been paid, was $2,000,000. Forty thousand tons comprised the shipments, and they consisted of ores and bullion. Most of this came from the Slocan country, via the Pilot Bay smelter, and the duties on it aggregated $96,000. The Slocan Star and the Skyline are the heaviest shippers in that section. Gold ores have been shipped from Trail and other districts to the value of $2,000 000, a total value of ores for a year of $4,000,000. The exports show that during the year goods to the value of $1,000,000 have passed through Northport and have paid duty. By far the largest part of the exports have been groceries and foodstuffs. Every article which is consumed in prosperous mining camps is included in the lists of the customs collector. Rossland imports the bulk of goods.

The Occidental Gold Mining Company has filed articles of incorporation. The capital stock is $1,000,000.

The Snohomish *Tribune* reports that there is more activity than ever in the Silver Creek and Monte Cristo districts.

Barnato is the name of a new town being laid out in the Cedar canyon country. It is started by the Legitimate Mining and Smelting Co. of Houston, Texas, which has purchased a number of mining claims and is to erect a smelter. It is reported that copper, iron and lime are to be had in the vicinity.

BRITISH COLUMBIA.

Nelson *Miner*: A syndicate of Detroit and Toronto capitalists has bonded the Kennedy and Marshall groups of claims on the north fork of the Illecillewaet for $80,000, paying $5000 in cash.

A new town, known by the name of Ferguson, has been started at the forks of the Lardeau, fifteen miles from Thomson's Landing. It is surrounded by several groups of mines.

The Nelson smelter has closed contracts with the Nickel Plate, Crown Point and Columbia and Kootenay mines.

Work is to be commenced on the Bondholder group, on the Ten Mile divide.

The L. F. R. & C. Gold Fields Co. has bought the Oak Leaf and Maple Leaf at Illecillewaet for $90,000. A tramway and concentrator will be erected.

The same company has commenced work on the Broadview, Old Sonoma and Philipsburg claims.

Rossland *Miner*: The Le Roi is embarrassed with the quantity of ore on hand. The smelter people are unable to handle the surplus. Owto the fact that all the available space above is covered with ore, only about 100 tons a day are being raised, while the mine is capable of producing 300 tons a day.

ALASKA.

H. C. Thornton, back from Alaska, says he has twenty square miles of placer ground at Cook Inlet that will go $1 a yard. At another place he has eight square miles still richer. That is the kind of statement that misleads those who know no better and "rush" to a country that can give no such wealth; suffering hardships and exposure in pursuit of what does not exist.

UTAH.

It is expected that the mill at the Sacramento, at Mercur, will be working 100 tons of ore per day.

According to the Salt Lake *Tribune*, there is more development work going on at Mercur than ever before.

The Frisco Mining Company, which five years ago was a steady producer of bullion, but was closed down with the fall in silver, has made its first shipment under the new management of J. W. Langley and his associates.

The Eureka Hill mine, in Tintic, now has a force of 230 miners at work and in the mill 100 stamps are dropping.

Tribune: At Ophir canyon the DeLamar electric lighting plant will be completed this month, when the lights will be turned on in Mercur.

The managers of the Sacramento, at Mercur, which has lately paid its first dividend, have decided to increase the capacity of the mill to 100 tons daily, and, the material having been ordered, it is expected that the production will be increased to that figure within the next thirty days. The company has been to great expense in developing the ore bodies.

A strike has been made in the Primrose in Silver City. The results have been identical with those experienced by the owners of neighboring claims. For 75 feet the shaft was put through what is known as the iron zone, when, at a depth of 175 feet, 4 feet of ore was uncovered that assays 40 ounces in silver, 26 per cent lead and gold of the value of $2 a ton.

Salt Lake *Tribune*: Supt. Treweek reports another strike in the Mercur.

The Blue Jay in Beaver county, over which there has been much contention in the past, has been acquired by John G. Gray of Salt Lake, who proposes to begin its development.

Shipments of ore through the Mackintosh sampler at Park City last week were as follows: Silver King, first-class, 975,800 pounds; Silver King, concentrates, 436,500 pounds; Varco concentrates, 30,650 pounds.

Shipments from the Tintic district last week were as follows: Bullion-Beck mine, thirty carloads of ore; Bullion-Beck mill, ten carloads concentrates; Gemini, five carloads of ore; Eureka Hill, four carloads of ore; Ajax, three carloads of ore; Utah, six carloads of ore; South Swansea, one carload of ore; North Star, two carloads of ore; Dragon iron mine, four carloads of ore daily.

The Centennial Eureka mill distributed its regular $30,000 dividend last week, making a total of $1,800,000.

Tribune: At Park City the Crescent Co. has had a large force of men at work for some time retimbering the incline shaft and strengthening weak spots in the mine. The property will be in shape for immediate active work or for continued idleness, whichever policy the company elects to follow. To date the Peck Concentrating Co. has refused to make a direct bid for Crescent ore, and the company is undecided whether to repair the tramway for active work or not, as the value of the ore on hand cannot be estimated until a bid is made.

Supt. Hall of the Crown Point says work is being rushed at that property with three shifts and will continue without interruption. The property is thoroughly equipped with an 85 H. P. boiler and a 25 H. P. engine.

A part of the North Tintic mining district is situated within the limits of Fort Crittenden reservation. The question as to the validity of mining locations made within the reservation has for months past been one of great interest to claim owners in Camp Floyd and North Tintic mining districts, and attorneys of such owners. The date of throwing open the reservation was April 9th, 1895, and all locations of mining claims made prior to that time are void.

Tribune: The mines of Bingham are estimated to be in condition to make a present output of 10,000 per month, and practical demonstration would occur if the markets offered sufficient stimulus.

IDAHO.

The Gold Flint Mining Company has been incorporated in Salt Lake to do business in Idaho, with a capital stock of $1,500,000.

The Hunter has resumed business much sooner than was expected when the mill was shut down to do development work. An ore body has lately been struck and orders have been given to put on both shifts in the mill and enough miners to keep them busy.

MONTANA.

The Katie mine at Basin, which was closed down on account of the great fire of Aug. 13, 1895, is again starting up. The new mill will have a daily capacity of 500 tons. The company also contemplates building a smelter.

The Sitting Bull mine is again being worked.

Inter-Mountain: The closing down of the Anaconda Camp creek properties is a severe blow to the town of Melrose.

The Maggie, bonded to the Montana Ore Purchasing Co., is in operation.

There promises to be a lawsuit, if not greater trouble, over the possession of the Melrose mine, a gold property with a rich lead, on the Camp creek slope, arising out of the question of priority of location.

The Union Hill Gold Mining Company is prosecuting developments on the Union Hill and Hoodoo properties. This same company is also extracting ore from the Black Prince and Collecta and hauling it to the Galena smelter, which they intend to blow in in a short time.

SOUTH DAKOTA.

Articles of incorporation have been filed with the Secretary of State for the Western Mining and Milling Company, with a capital stock of $1,000,000; principal place of business, Deadwood; and for the Sunnyside Mining Company at Hill City, with a capital stock of $300,000.

Black Hills *Times*: The Anna Creek Gold Mining and Milling Co. has been organized in Deadwood by capitalists of Pittsburg, Pa., with a capital of $1,000,000. The company has $350,000 in its treasury to erect a smelter with a capacity of 100 tons daily.

From forty to fifty tons of high-grade siliceous ore is being shipped every week from the surface workings of the Deadwood-Terra. The ore is reported to have an average assay value of $100 gold per ton.

Black Hills *Times*: William McMillan of Jim creek, eighteen miles southeast of Deadwood, has been made a proposition by the D. & D. smelter to take a carload of twenty to twenty-five tons per week of his copper ore at $30 per ton. Mr. McMillan states that the proposition is identical with what the noted Anaconda mine of Montana was when first taken hold of by capital. The formation on Jim creek is dolomite, porphyry, quartzite and gneiss. The copper ore is found in small vertical veins coming up through the dolomite. A cross vein of white quartz carrying a large percentage of lead and silver, and from $3 to $4 gold per ton, cuts through the dolomite and veins of copper ore. The copper is in the form of an oxide and glance.

COLORADO.

August Rische, the discoverer of the Little Pittsburg at Leadville in 1878, has made a new discovery in the New York group in the Alma district.

At Cripple Creek during June the chlorination mill at Gillett treated 1420 tons of $30 ore; the Brodie mill 1800 tons of $15 ore. The Florence mill is treating 150 tons daily, and it is expected that the new chlorination mill at Colorado City, with a capacity for 250 tons daily, will start up October 15th.

At Idaho Springs a contract has been let for sinking the Shafter shaft 600 feet.

A rich strike is reported in the Yankee Boy at Carson.

During July there were shipped to Denver smelters from Black Hawk station, Gilpin county, 216 cars aggregating 3456 tons of mineral—a large increase over last year.

At Telluride the Columbia-Menona is producing 100 tons of ore daily.

A large air compressor and other machinery is being put up by the Hector Mining Company to drive in the 4000-foot tunnel to intersect the vein of Montana Nos. 1 and 2.

The Smuggler-Union 50-stamp mill at Pandora is treating 5000 tons of low grade ore per month and shipping about 100 tons of high-grade ore in the same time.

Cripple Creek *Mail*: The Santa Rita, at the foot of Squaw mountain, is producing between 50 and 60 tons a week, the ore running from $120 to $200 a ton.

The Anaconda is now doing better than at any previous time in its life. An average of 25 tons of mill ore is now produced daily in addition to the unusually heavy shipment of a high smelting grade.

The output from the Ironclad for the past week was 30 tons of smelting and 50 of mill ore. This is in addition to the sensational ore that has been sacked.

The output of the Victor in July was practically the same as that of the month preceding, or, for that matter, for any thirty days during the past year. Supt. Cone, after getting enough out to pay expenses and the $20,000 monthly dividend, puts his miners on development work from that time on, and the reserves are now large.

The Iron mine at Rico was bonded by a Denver syndicate fifteen months ago and has produced on an average of forty tons per week since that time. A large ore body was recently encountered in the 150 foot level.

ARIZONA.

(Special Correspondence)—The Continental mine, twelve miles west of Globe, was located as a gold mine in 1880. While there was considerable ore in sight, in those days labor was high and supplies cost three times what they do now, and the ore on the surface only carried $5 to $6 in gold. N. L. Amster has bonded this property, sunk a shaft 50 feet and crosscut 55 feet, opening up a body of rich copper ore, carrying gold and silver. He is now driving a tunnel north 800 feet in length to crosscut the lode at a depth of 700 feet.

Globe, Arizona, Aug. 15th.

There are 50 men on the payroll of the Pearce mine.

At Tucson the United Globe Company is putting in a 150-ton smelter.

The Empire Smelting Company, at Crittenden, has decided to continue operations.

The Congress Gold Mining Company's new locomotive is a six-wheel switcher, oil burner, cylinders 17½x24 inches, and weighs 112,000 pounds.

Nogales *Oasis*: Some new and promising copper locations are reported to have been made in the Rosemont district.

At the old Peck mine, at one time a heavy producer and worked for thirty years, a new strike has been made fifty feet from the old lead.

An expert who recently took measurements in the Sun Dance and Silver Trail mines is quoted as saying that the properties have 12,000 tons of ore in sight, carrying an average value of $25—gold, silver and lead.

J. E. and J. G. Allen have given a bond to Charles McLloyd for five claims in Cherry Creek district for $20,000.

The Little Jessie mine has declared a dividend of $5000 out of a six weeks' run since resuming work.

The Planet-Saturn Company is preparing to work its Fool's Gulch property on a large scale. In addition to the 200,000 pounds of machinery, for which transportation has been contracted, the company has contracted for ten carloads of firebrick and fireclay from Phœnix and for twelve carloads of lumber and two carloads of tank material from California. They expect to have the mill up and in operation by November.

Mining News: A rich strike is reported to have been made in the Ripsey, sixty miles north of Tucson. At a depth of 500 feet a body of ore averaging six feet in width was found.

A survey has been completed of the group of mines owned by the Chicago Gold Mining and Reduction Company, in Cherry Creek district. A site has also been surveyed for a mill, and work will be commenced shortly in grading for it.

A new hoist has been ordered for the Jersey Lily mine, and will be placed in position upon its arrival.

MEXICO.
